A WEEKLY
ILLUSTRATED JOURNAL
OF
ART,
CIVIL ENGINEERING,
AND
BUILDING.

Of all the arts of ornamentation, the one which (to borrow a well known phrase from the Utilitarian school) affords the greatest happiness to the greatest number, is beyond all question that which is always called the Queen of the Arts—Architecture; provided, of course, it is good architecture.—
E. B. DENISON (LORD GRIMTHORPE).

VOL. LXXVII.

JANUARY TO JUNE 1907.

LONDON:

PUBLISHED AT IMPERIAL BUILDINGS, LUDGATE CIRCUS, E.C.~

THE ARCHITECT AND CONTRACT REPORTER. A JOURNAL OF ART, CIVIL ENGINEERING & BUILDING.

THE WEEK.

THE name of the late Lady BURDETT-COUTTS, who died on Sunday last, deserves respectful mention in an architectural journal. Her long life was devoted mainly to benevolent objects, and it was hardly possible for her to avoid a recognition of the necessity of special buildings. As a Churchwoman she endowed the bishoprics of Cape Town, Adelaide and British Columbia. Sixty years ago Westminster, although it possessed the Houses of Parliament and the Law Courts, was one of the most abandoned parts of the Metropolis. As an effort towards the reformation of the people, Miss BURDETT-COUTTS resolved to erect a large church, in which the seats were to be all free. The commission was given to BENJAMIN FERREY, and the work was commenced in 1846. It was consecrated in 1850, and at the time was regarded as a remarkable example. In connection with the Church various buildings arose at her expense. Another church, also dedicated to St. Stephen, was erected in a poor part of Carlisle. She munificently contributed to the establishment of churches in many places. Lady BURDETT-COUTTS at a later period made the experiment, by means of secular buildings, of aiding in the civilising of London. Moved with pity for the costermongers and their customers in the east of London, Columbia Market was erected, where poor people could buy and sell while protected from the weather. The Gothic style was adopted, and ignorant people imagined that the market was a trap to bring them under ecclesiastical influence, and neither tenants nor purchasers were to be found to fill it. Afterwards the property was made over to the Corporation to serve as an eastern fish market. Nevertheless, again it was a failure. Adjoining the market the Baroness provided some model dwellings, also in the Gothic style. They were unlike any others in England. In their original condition, before they had suffered from inappreciative tenants, the rooms were adapted for a superior class of occupiers, and, indeed, if a reasonable return on the outlay was sought, high rents would have to be charged. No other woman has expended such large sums for the benefit of the poor, and the value of her disbursements was enhanced by the generous spirit which inspired them.

WE lately described the building in Paris which was known as the Archbishop's Palace. After his eviction the prelate went to reside at the house of M. DENYS COCHIN. Another mansion has, however, been obtained which is not without some interest. The building which is occupied by the French representatives is generally known as the Palais Bourbon. Formerly it was a part of the Pré-aux-Clercs. It was purchased for the purpose of erecting a barrack for the musketeers. Instead, the Dowager-Duchess of BOURBON had a mansion set up in 1722 from the designs of the Italian architect, GIRARDINI. Her grandson thought the building unworthy to be his residence. He purchased more ground and expended about twenty millions of

francs in building. At the time of the Revolution the palace was seized and was turned into a meeting-place for the Council of Five Hundred. NAPOLEON had the Greek peristyle constructed, which is the most remarkable feature of the exterior. The architect of the Prince DE CONDÉ was JEAN DE JOLY. He was able to obtain a site for a house from his patron, and the building which he erected in order to be able to superintend the works has been secured for the use of the Archbishop of PARIS. The alterations of the palace, which were ordered by the Revolutionary authorities and by NAPOLEON, were not carried out by DE JOLY, but two other architects bearing his name were afterwards connected with the building.

ABOUT 1835 a small oratory was discovered at a place called Perranporth, on the north-western coast of Cornwall. It had been overwhelmed by sand five or six centuries before. The parish was known as Perranzabuloe, and under that name it became known through the efforts of a clergyman who attached greater importance to it than it really deserved, for he claimed it to be the only surviving example of the primitive British church. He was not restrained in his language, and he excited the scorn of MATTHEW ARNOLD and other lovers of measure and restraint in literature. The church was only 25 feet in length if measured within; it was $12\frac{1}{2}$ feet in breadth and $12\frac{1}{2}$ feet in height. At the east end was a stone altar 4 feet long. The chancel was 6 feet in length. The congregation sat on stone seats 12 inches wide and 14 inches high, which were attached to the west, north and south walls. There was no trace of a window, and it was assumed the services were held by candle-light. St. PIRAN, according to the legend, came from Ireland, having been carried over the waves on a millstone. The oratory still exists. In order to preserve it, for which purpose it will be necessary to drain the site, Mr. EDMUND SEDDING estimates that a sum of about 500*l.* will be required. One Cornishman has offered 10*l.* if nine others will do the same. The oratory is certainly one of the most ancient Christian buildings in the country, and it will afterwards be regretted if it should be so far neglected as to become a ruin.

At the monthly meetings of the Society of Architects during the ensuing quarter papers will be read by Mr. G. E. BOND on "The Practice of Architecture in our Smaller Cities and Towns;" by Mr. W. A. SCOTT on "Byzantine Architecture," and by Mr. ELIS MARSLAND on "Fire-resisting Properties of Materials of Construction." There will be a smoking concert on January 18. The papers to be read in April and May will be announced. The Society will be represented at the Congress of the Royal Sanitary Institute, to be held in Dublin in June, by Mr. ROBERT WALKER and Mr. A. SCOTT. At the School Hygiene Congress in August the delegates will be Mr. A. E. PRIDMORE and Mr. W. SCOTT DEAKIN. The annual general meeting will be held on October 17.

COMMERCIAL EUROPE—CORN AND WINE.

ARCHITECTURE IN 1906.

THE event of the year that has now passed has undoubtedly been the

INTERNATIONAL CONGRESS OF ARCHITECTS, held in London under the direction and organisation of the Council of the Royal Institute of British Architects. We are happy to know that, as such assemblies go, this was admittedly one of the most successful of the series, of which this was the seventh instance, of international congresses of architects. Nearly 1,700 members, of whom 700 were visitors to England from the continent of Europe, from America, from the British dominions beyond the sea, and even from far-off Japan, took part in the social functions and deliberative assemblies that went to make up the programme of the Congress.

The inaugural meeting was, by permission of the Right Hon. the Lord Mayor and the Corporation of the City of London, held at the ancient Guildhall, and was honoured by the presence of H.R.H. the Princess LOUISE and His Grace the Duke of ARGYLL, the Lord Mayor and Lady Mayoress and the Sheriffs, members of the Diplomatic Body, leading representatives of the Royal Academy and of the architectural profession, both in Great Britain and abroad.

On the social side of the proceedings there were a soirée given by the President and members of the Royal Academy at Burlington House, a reception by the Lord Mayor at the Mansion House, an evening garden party given by the Royal Institute of British Architects at the Botanic Gardens, Regent's Park, and a farewell banquet at the Hôtel Cecil, at which nearly 500 ladies and gentlemen were present.

Excursions and visits were made by large parties to Hatfield House, Hampton Court, Cambridge, College of Science and Victoria and Albert Museum at South Kensington, Greenwich Hospital, Buckingham Palace Gardens, Westminster Abbey, Messrs. HOLLOWAY's and Messrs. DOULTON's works.

On the business side papers were read on "The Château of Saint-Germain-en-Laye," "The Execution of Important Government and Municipal Architectural Work by Salaried Officials," "Steel and Reinforced Concrete," "The Use of Burned Clay Products in the Fireproofing of Buildings in the United States of America," "The Conduct of International Architectural Competitions," "The Ownership of Architects' Drawings," "The Conservation of National Monuments," "Architecture and Craftsmanship," "The Planning and Laying-out of Streets and Open Spaces," "Artistic Copyright," "The Architect's Control over Artists and Craftsmen," "The Education of the Public in Architecture," "The Tomb of AGAMEMNON," "Statutory Qualification for Architects."

Numerous resolutions were passed and recorded on most of the above-mentioned subjects as the matured and deliberate opinions of the architects of the world, and "nobody seemed one penny the worse."

The main object of these congresses was doubtless attained and with conspicuous success—the interchange of social intercourse, the increase of a spirit of "camaraderie" and "entente cordiale" between members of the profession from different countries; but, as may be gathered from the list of subjects discussed,

polemical and political questions predominated, and mutual improvement in knowledge, either practical or æsthetic, was far to seek.

From an educational point of view, by far the most valuable feature of the Congress was the remarkable exhibition of drawings illustrating the historical development of English architecture, and divided into four sections—Norman and Early Gothic, Middle and Late Gothic, Early Renaissance and Later Renaissance. This exhibition was admirably arranged under the direction of Mr. HARRISON TOWNSEND and Mr. FORSYTH, and comprised not only drawings and water-colour paintings, but a wonderful collection of very fine examples of furniture and silverwork.

The past year has been notable for the latest phase in the development within the ranks of the Royal Institute of the question of

REGISTRATION,

or the statutory qualification for architects.

This latest phase is essentially a compromise between the extremist views of those who would advocate the "registration" of all "architects," and of those who pin their faith to "education" of future aspirants to the profession and non-interference with present-day practitioners. Briefly, the proposal is that Parliamentary recognition should be sought for the Royal Institute as the statutory authority for the granting of diplomas to qualified practitioners in architecture and for the regulation of a definite course of architectural education. It is also proposed that the Institute scale of charges should be legalised for all of its professional members, and that increased disciplinary powers should be obtained for the regulation of professional conduct. Incidentally it is suggested that the Royal Institute should in future become the "Royal College of Architects," but this hardly appears material to the scheme as a whole, and is probably viewed unfavourably by the majority of members of the present Royal Institute.

The proposal, as far as its general principle is concerned, has been received with striking unanimity by the general meeting before whom it was laid, and has been referred to the Council for the elaboration of details and preparation in form for submission to Parliament and the Privy Council.

Thus peace, for the present at any rate, has been concluded between the opposing parties that have till recently troubled the affairs of the Royal Institute. The wise compromise on which this peace is founded is due doubtless in no small degree to the joint committee of leaders of the two antagonistic factions, which, having taken the evidence of a large number of representative architects, has agreed to recognise that there is much to be said both for and against out-and-out registration.

If the scheme that has been provisionally adopted is carried through it appears likely to produce the beneficial effects that the advocates of registration expect from the adoption of the principle without the manifest drawbacks that the anti-registrationists emphasise; it also makes for the further improvement of the education of embryo architects, and undoubtedly lifts the Royal Institute to a higher and better recognised plane of existence than it has hitherto enjoyed.

Therefore the unanimity with which the scheme has

been received is not surprising, conciliating as it does the three dominant shades of opinion existing amongst the members of the Royal Institute. With these conditions in its favour it can hardly evoke any organised opposition outside the ranks of the Royal Institute sufficiently powerful to jeopardise its ultimate acceptance by the Legislature.

The resolution adopted at the meeting of the Royal Institute on February 29, 1904, by which admission to

FELLOWSHIP OF THE ROYAL INSTITUTE

should be, save in exceptional instances, restricted after the close of the year 1906 to those who had passed an examination, has naturally caused a rush of candidates for election under the regulations existing before the closure became operative. Amongst these candidates were undoubtedly some who might reasonably be expected to submit themselves to examination and others whom many Associates felt were being more leniently treated than themselves. Hence a practical protest by the use of the ballot and black ball on the part of younger members resulted in the exclusion of some quite worthy candidates and a certain amount of heated feeling. The amendment of the by-law consequent on the resolution of February 29, 1904, not having been submitted to and approved by the Privy Council, it was at the December business meeting resolved that the date December 31, 1906, in the resolution of February 29, 1904, be extended to December 31, 1907, so that admission to the ranks of Fellows still remains open for another year on the old lines, but with the proviso that the Council has pledged itself to act in accordance with the spirit of the proposed amended by-law.

An excellent action of the Council of the Royal Institute, and one that should prove of very great value to architecture, has been the constitution of a

JOINT COMMITTEE ON REINFORCED CONCRETE,

composed of representatives of the Royal Institute, the District Surveyors' Association, the Institute of Builders, the Incorporated Association of Municipal and County Engineers, the War Office, and comprising the names of Sir HENRY TANNER (chairman), H. D. SEARLES-WOOD (hon. secretary), A. T. WALMSLEY, WILLIAM DUNN, MAX CLARKE, T. H. WATSON, E. DRU DRURY, BENJAMIN I. GREENWOOD, FRANK MAY, A. E. COLLINS, J. W. COCKRILL, Colonel C. B. MAYNE, Major E. M. PAUL, R.E., Professor W. C. UNWIN, CHARLES F. MARSH.

The Royal Institute has also been able to make its influence felt by the advice tendered to and accepted by the London County Council relative to the form of the forthcoming

COMPETITION FOR NEW COUNTY HALL FOR LONDON, which, as described in the issue of *The Architect* for December 21, 1906, is intended to be conducted in two stages—the first, open and international, by which a limited number of architects, not less than ten and not more than fifteen, is to be selected to compete in the second stage with eight invited architects, viz. Mr. JOHN BELCHER, Mr. W. FLOCKHART, Mr. ERNEST GEORGE, Mr. H. T. HARE, Mr. T. G. JACKSON, Mr. E. L. LUTYENS, Mr. E. W. MOUNTFORD and Messrs. NICHOLSON & CORLETTE. Following the present trend of opinion in the architectural profession, it is proposed that the ultimate competition shall be judged by a jury of assessors.

The scheme promoted by the ex-president, Mr. BELCHER, for obtaining a

NEW HOME FOR THE ROYAL INSTITUTE,

although approved in principle by a business meeting of members held on January 8, has been abandoned, owing to the impossibility of settling in a satisfactory manner questions of ancient lights dominating the proposed site.

The past year has seen the commencement of the operation of the

LONDON BUILDING ACTS (AMENDMENT) ACT, 1905, with its drastic and retrospective effect on existing property, and a new department has been created on the staff of the London County Council to deal with the procedure of enforcing the provisions of the Act.

Repeated attempts by the Building Act committee of the London County Council to change the present

SYSTEM OF PAYMENT TO DISTRICT SURVEYORS

by a fixed scale of fees into one of salaried officials have been defeated, as much from considerations of finance as from the equally if not more important question of efficiency; and on this latter ground we cannot but feel that the best interests of the public, whether as rate-payers or as building owners, are far better served by the maintenance of the present system than by the introduction of the proposed innovation.

THE STATE OF TRADE

during the past year has apparently shown considerable improvement in most spheres of activity throughout the country; but up to the present this improvement has not been reflected to any appreciable extent in architecture. The monthly returns as to the conditions of employment in the building trades have been invariably discouraging, though showing a slight improvement as compared with corresponding periods in the year previous. The optimistic assertion of the President of the Local Government Board in the House of Commons on May 23, that the condition of the building trade was improving rapidly, and that everything pointed to the industry joining in the increased prosperity of other trades, has not been justified by events; on the contrary, even speculative building in the London suburbs has shown considerable diminution. Two dominant factors have exerted a potent adverse influence on the prosperity of the building trade—firstly, the dearness of money produced by the scarcity of the gold reserve in this country, as evidenced by the abnormally high Bank rate; and secondly, the wave of economy that has swept over the ratepayers, as shown by the displacement of the "wastrels" or Progressive party in the borough elections of the last autumn, resulting already in the abandonment or postponement of the erection of public buildings for which measures had already been sanctioned and the designs of architects selected and approved.

The lack of prosperity in the architectural profession is further demonstrated by the preponderance in number of

IMPORTANT BUILDINGS COMPLETED

during the past year over that of those commenced. Amongst the most prominent architectural works finished may be mentioned the Belfast City Hall, erected at a cost of over 300,000*l.*, the architect for which fine building is now Sir A. BRUMWELL THOMAS. The new Sessions House for the City of London has been practically completed from the designs of Mr. E. W. MOUNTFORD, and takes high rank amongst the notable buildings of the Metropolis. Another notable achievement of modern architecture is the group of buildings erected for new law courts and municipal buildings at Cardiff, from the designs of Messrs. LANCHESTER & RICKARDS. The first part of the scheme for municipal buildings and town hall at Barry has been completed by the erection of the public library from the designs of Messrs. C. E. HUTCHINSON & E. HARDING PAYNE. New public offices in Pontypridd have been opened, the designs of Mr. H. T. HARE having been carried out at a cost of 16,000*l.* The town hall at Sutton Coldfield has been opened on completion of the design of Mr. A. R. MAYSTON. The new municipal buildings for Woolwich have been completed from the designs of Sir A. BRUMWELL THOMAS, and were opened on January 13. The important Government buildings for the War Office in Whitehall have been practically completed from the designs of the late Mr. WILLIAM YOUNG, carried out under the direction of his son, Mr. CLYDE YOUNG. Another Government building

finished during the past year has been the new electro-technical building at the National Physical Laboratory, opened by Mr. HALDANE on June 25. The extension to New Scotland Yard, the headquarters of the metropolitan police, has also been completed. A considerable number of buildings have been erected for the Crown Post Office, amongst which may be mentioned the extension of the Edinburgh General Post Office, at a cost of 50,000*l.*, designed by Mr. W. T. OLDRIEVE, of H.M. Office of Works, and the new post office at Aberdeen at an expenditure of 52,000*l.* Amongst the works completed for the London County Council was the first moiety of the great electricity generating station at Greenwich, and Vauxhall Bridge.

Several extensive buildings for the relief of the sick and poor have during the past year become ready for occupation. The first part of the Leeds workhouse extension, costing 100,000*l.*, has been completed from the plans of Messrs. THOMAS WINN & SON. The asylum at Naburn for the York City Council, necessitating an expenditure of 133,000*l.*, has been finished, and so also has that at Caerleon, for Newport, Mon., erected for 116,000*l.*, from the designs of Mr. A. J. WOOD.

The King's Sanatorium, at Midhurst, erected from the designs of Mr. H. PERCY ADAMS, has been opened by His MAJESTY. A sanatorium for consumptives at Barrasford, North Tyne, has been completed from the designs of Messrs. NICHOLSON & DOTCHIN, at an expenditure of 20,000*l.*; and the first part of the extension of the sanatorium at Blackpool, costing 16,500*l.*, has been finished, Mr. F. T. WADDINGTON being the architect. Messrs. YOUNG & MACKENZIE'S designs for the new infectious diseases hospital at Purdystown, Belfast, have been carried out, and the building has been opened by the Lord-Lieutenant of Ireland and the Countess of ABERDEEN. The opening of the new buildings for the North London or University College Hospital was honoured by royalty in the persons of the Duke and Duchess of CONNAUGHT, the architects in this case being the late Mr. ALFRED WATERHOUSE, R.A., and his son, Mr. PAUL WATERHOUSE. The poorhouse erected for the Aberdeen City Council at Oldmill, from the plans of Messrs. BROWN & WATT, has been completed at a cost of 120,000*l.* The Andrew Gibson Home for Seamen's Widows at Liverpool, designed by Mr. ARTHUR P. FRY, and costing 30,000*l.* to build, has been finished and opened, whilst the Union Jack Club in Waterloo Road, London, is also practically complete, having been erected from the plans of Mr. H. B. MEASURES for 85,000*l.*

Several large educational buildings have been finished during the past year. King Edward VII.'s Grammar School at King's Lynn has been built from the designs of Mr. BASIL CHAMPNEYS, and was opened by His MAJESTY in person. New schools for the Birmingham City Council, both secondary and elementary, have been erected in the City Road from the designs of Messrs. BUCKLAND & FARMER, and have cost 45,000*l.* The Armstrong College, Newcastle-on-Tyne, has been completed by the addition of the main building costing 60,000*l.* to the two earlier blocks, each of which was built for about 20,000*l.*, Mr. W. H. KNOWLES being the architect. Amongst Council schools finished during the past year have been those at Calton Road, Gloucester, designed by Mr. WALTER B. WOOD, and costing 14,000*l.*; those at Chatham, of which Mr. HERBERT H. DUNSTALL was the architect, the expenditure being 11,635*l.*; Oaklands Road School, Hanwell, built for 18,250*l.* from the plans of Mr. W. PYWELL; those at Carter Knowle, Sheffield, completed for 15,220*l.* from the designs of Messrs. HOLMES & WATSON. Mr. F. L. PEARSON'S designs for St. Helen's Girls School, Abingdon, have been carried out for about 30,000*l.* University College, Reading, has been completed from designs prepared by Mr. W. RAVENSCROFT and Mr. C. STEWARD SMITH, assisted by Mr. H. HUTT

and Mr. W. R. MORRIS. The inauguration of the additional buildings of Aberdeen University by their Majesties the KING and QUEEN became a national event. Mr. A. M. MACKENZIE, A.R.S.A., is the architect.

Amongst commercial and business undertakings we have to record the completion of the new Liverpool Cotton Exchange, erected at a cost of 200,000*l.* from the designs of Messrs. MATEAR & SIMON, selected in a competition restricted to Liverpool architects. An important addition to the Glasgow Stock Exchange has been carried out from the designs of Mr. J. J. BURNET. An extensive building is that for the new head offices of the North-Eastern Railway Company, erected at York from the designs of the joint architects, Mr. HORACE FIELD and Mr. W. BELL. The city of Norwich has had added to its architectural attractions the new head offices of the Norwich Union Life Assurance Company, designed by Messrs. G. J. & F. W. SKIPPER. In the Metropolis we have seen the new offices of the Hearts of Oak Benefit Society erected from the designs of Messrs. ESSEX, NICOL & GOODMAN, and opened by His Majesty the KING. Messrs. WARING & GILLOW'S new premises in Oxford Street, built from Mr. R. FRANK ATKINSON'S designs, have been opened with a cleverly-worked boom of public interest. Caxton House, Westminster, a notable piece of office building, has been completed from the designs of Mr. J. S. GIBSON. Another great caravanserai has been added to London in the Ritz Hotel, Piccadilly, built from the plans of Messrs. MEWES & DAVIS, in collaboration with Mr. BISHOP.

An interesting essay in the use of coloured material for external architecture has been brought to fruition in the erection of a house in Addison Road, Kensington, from the designs of Mr. HALSEY RICARDO.

Amongst buildings erected for the amusement of the public may be mentioned the King's Theatre, Edinburgh, completed at a cost of 50,000*l.* from the designs of Messrs. JAMES DAVIDSON & J. D. SWANSON; the Marine Palace, Clacton-on-Sea, built for 40,000*l.* from plans by Messrs. SPENCER & TIGHE; and the New Theatre at Cardiff, of which Messrs. ERNEST RÜNTZ & FORD were the architects.

IMPORTANT BUILDINGS COMMENCED

during the last year include the South Wales University College, for the first portion of which has been accepted the tender of Messrs. E. TURNER & SONS to carry out the designs of Mr. W. D. CARÖE. A commencement has been made with the first part, costing 25,000*l.*, of the scheme planned by Messrs. H. & A. P. FRY for the Liverpool County Hospital for Children, the ultimate estimate for which is 60,000*l.* A greatly reduced version of Mr. W. G. HUNT'S original 100,000*l.* design for new municipal buildings at Acton, Middlesex, has been started at a contemplated outlay of 35,000*l.* The foundation-stone has been laid of the new Ossett town hall, which is being built from the designs of Messrs. W. HANSTOCK & SON at an estimated cost of 20,000*l.* The tender of Mr. F. G. MINTER at 18,793*l.* for new municipal buildings at Bromley, Kent, has been accepted, Mr. R. FRANK ATKINSON, whose designs were selected in open competition, being the architect. New Y.M.C.A. premises at Leeds to cost 49,000*l.* have been commenced from the designs of Mr. W. H. THORP. An extension of the Glasgow Post Office estimated at 80,000*l.* has been begun from plans prepared by Messrs. W. W. ROBERTSON and W. T. OLDRIEVE, of H.M. Office of Works. A commencement has been made with the extensive new buildings for King's College Hospital at Denmark Hill, for which Mr. W. A. PITE'S designs involving an expenditure of between 300,000*l.* and 400,000*l.* were selected in a limited competition. The foundation-stone has been laid of a new episcopal residence at Southwell, of which Mr. W. D. CARÖE is the architect.

The general slackness in architectural activity has been strikingly illustrated by the insignificance of the

COMPETITIONS

decided during the past year, with the single exception of the international competition for the Peace Palace at The Hague. In this English architects were singularly unsuccessful, the first place being gained by M. L. M. CORDONNIER, of Lille; the second by M. F. A. MARCEL, of Paris; the third by Herr FRANZ WENDT, of Charlottenburg; and the fourth by Herr OTTO WAGNER, of Vienna, whilst premiums were also awarded to Mr. HOWARD GREENLEY and Mr. H. S. OLIN, of New York, and to Herr FRANZ SCHWECHTER, of Berlin. Purely British open competitions have been almost confined to schools and public libraries; indeed, but for the Education Act and Mr. CARNEGIE, the opportunities for ambitious assistants to test their untempered swords in the arena of open competitions would be practically nil.

In each year it seems to be almost a regular occurrence for some one of our

CATHEDRALS

to present an alarming state of insecurity for the sympathetic concern and help of the public. This last year it has been the turn of the great metropolitan cathedral of St. Paul, the immortal work of Sir CHRISTOPHER WREN. All at once with dramatic suddenness the public is informed that the building is in imminent danger, and that 40,000*l.* is wanted to save it from falling into the street. We are, however, to have a careful inspection and report from a triumvirate of eminent architects, Sir ASTON WEBB, Mr. T. E. COLLCUTT and Mr. JOHN BELCHER, so that we may believe that the mischief which has doubtless been developing for years will be calmly investigated, and that panic is unnecessary.

The Dean and Chapter of Gloucester have wisely taken early steps to prevent more serious mischief to their cathedral, and, on the advice of Mr. F. W. WALLER, have started works at an estimated expenditure of 8,150*l.* The restoration of the north transept of Peterborough Cathedral has been commenced under the direction of Mr. G. F. BODLEY, R.A. Fresh trouble has appeared at Winchester Cathedral, this time to the south aisle of the nave, for which an expenditure of another 5,000*l.* is deemed necessary. On October 17 occurred the interesting celebration of the 800th anniversary of the consecration of Ely Cathedral.

A national calamity has been the disastrous fire at Selby Abbey, from which it may be hoped that guardians of our great masterpieces of architecture will learn two important lessons—that proper and adequate precautions against fire should be their imperative duty, and that sufficient provision should be made by insurance to restore the ravages of the devouring element should such occur.

Earthquakes in San Francisco and Valparaiso have caused immense havoc in the architecture of those cities, but have fortunately not been accompanied by any serious manifestations of earth tremors in this country, though they may remind us that as some sixty earthquake shocks occur in each year at some part or other of the world, we cannot always expect complete immunity. Indeed, only last week it has been suggested by Professor BELAR, of Laibach, the eminent seismologist, that the trouble at St. Paul's Cathedral may be due to earth tremors.

An interesting scheme, and one the achievement of which will be of great value, is that proposed by Mr. R. PHENÉ SPIERS for a

NATIONAL COLLECTION OF DRAWINGS OF ARCHITECTURE.

This scheme has so far materialised that the authorities of the Victoria and Albert Museum at South Kensington have agreed to take over and house the collection in their art library, and to afford due facilities for purposes of study.

APPOINTMENTS

of an important character during the past year have been those of Mr. MERVYN MACARTNEY as consulting architect to the Dean and Chapter of St. Paul's Cathedral, in succession to Mr. SOMERS CLARKE; of Mr. W. R. LETHABY as surveyor of the fabric of Westminster Abbey, consequent on the death of Mr. J. T. MICKLETHWAITE; and Mr. C. DE GRUCHY as Master of the Royal Academy Architectural Schools.

HONOURS

worthy of note have been the knighthood bestowed upon Sir A. BRUMWELL THOMAS; and the award by the American Institute of Architects of their first gold medal to Sir ASTON WEBB, whilst the Royal Gold Medal has, on the recommendation of the Royal Institute of British Architects, been given to Sir L. ALMA-TADEMA.

OBITUARY.

Comparatively few architects of the first rank have passed away during the past year, but the list includes the names of Mr. J. P. SEDDON, Mr. ZEPHANIAH KING, Mr. ERNEST GODMAN, Mr. F. WHITTINGHAM, Mr. ADAM HUNTER, Mr. J. I. FRANKLIN, Mr. W. FRAME, Mr. R. A. BRYDEN, Mr. W. GOLDSMITH, Mr. THOMAS GARNER, Mr. E. WOODTHORPE, Mr. GEORGE LOW, Mr. E. SALOMONS, Mr. E. E. SCRIVENER, Mr. A. MOSELEY, Mr. H. W. COLLINS, Mr. PHILIP WILKINSON, Mr. W. D. CHURCH, Mr. J. H. CHRISTIAN, Mr. JOHN WILLS, Mr. W. J. GANT, Mr. T. BARNES-WILLIAMS, Mr. JOSEPH GALE, Mr. F. W. LEDGER, Mr. CHARLES LONG, Mr. JOHN H. DAVIES, Mr. J. T. MICKLETHWAITE, Mr. H. A. PROTHERO, Mr. E. L. TARBUCK, Mr. H. S. LEGGE.

THE PREVENTION OF CORRUPTION ACT, 1906.

By PROFESSOR W. S. HOLDSWORTH, D.C.L.

WE suppose that no one will deny the prevalence of the habit of taking secret commissions, or the advisability of rooting out, if possible, this insidious form of commercial dishonesty. If the law on this subject can be so strengthened that it is able to deal with this evil effectually, it ought without doubt to be so strengthened. This Act, which came into force on January 1, 1907, is an attempt to accomplish this worthy object. It is, as is well known, intended to render criminal all corrupt transactions with agents, whether employed by the Crown or by any other public authority, or by a private person. Both the giver and the receiver of a secret commission are made guilty of the same offence, and subjected to the same penalties. We propose, in the first place, to discuss the meaning of the Act; in the second place, to consider how far it adds anything to the existing law; and, in the third place, to consider whether it is likely to carry out the intentions of the Legislature.

(i) As a necessary preliminary to the discussion of the meaning of the Act we must set out its operative clauses, all of which are contained in the first section:—

1. If any agent corruptly accepts or obtains, or agrees to accept or attempts to obtain, from any person, for himself or for any other person, any gift or consideration as an inducement or reward for doing or forbearing to do, or for having after the passing of this Act done or forborne to do, any act in relation to his principal's affairs or business, or for showing or forbearing to show favour or disfavour to any person in relation to his principal's affairs or business; or

If any person corruptly gives or agrees to give or offers any gift or consideration to any agent as an inducement or reward for doing or forbearing to do, or for having after the passing of this Act done or forborne to do, any act in relation to his principal's affairs or business, or for showing or forbearing to show favour or disfavour to any person in relation to his principal's affairs or business; or

If any person knowingly gives to any agent, or if any agent knowingly uses with intent to deceive his principal, any receipt, account or other document in respect of which

the principal is interested, and which contains any statement which is false or erroneous or defective in any material particular, and which to his knowledge is intended to mislead the principal; he shall be guilty of a misdemeanour, and shall be liable on conviction on indictment to imprisonment, with or without hard labour, for a term not exceeding two years, or to a fine not exceeding five hundred pounds, or to both such imprisonment and such fine, or on summary conviction to imprisonment, with or without hard labour, for a term not exceeding four months, or to a fine not exceeding fifty pounds, or to both such imprisonment and such fine.

2. For the purposes of this Act the expression "consideration" includes valuable consideration of any kind; the expression "agent" includes any person employed by or acting for another; and the expression "principal" includes an employer.

3. A person serving under the Crown or under any corporation or any municipal, borough, county or district council, or any board of guardians, is an agent within the meaning of this Act.

It will be seen at once that the provisions of the Act are very comprehensive. Their exact interpretation cannot, of course, be certainly known until cases have arisen for decision. But we may say at once that we think that a great deal that has been spoken and written about the scope of the Act is founded upon a misconception. It has been commonly said that the person who gives postmen or tradesmen or customers the customary gift at Christmas, or the person who gives the customary tip to the porter who carries his bag, or to the waiter who waits upon him at dinner, will render both himself and the recipient of his present liable to the penalties contained in the Act. We do not think that this is correct. It might be correct if the Act had run, "If an agent accepts or obtains from any person any gift, &c.," but the Act does not so run. The Act says, "If any agent *corruptly* accepts or obtains from any person any gift, &c." In the same way, in the third paragraph of section 1, subsection 1, which deals with the giving of incorrect receipts, accounts or other documents, the document must have been given knowingly, and the intent must have been to mislead. In all these criminal statutes we must rely on our adverbs to distinguish between conduct which falls within the statute and conduct which does not. "Actus non facit reum, nisi mens sit rea"—the mere act will not make a man a criminal without the criminal intent. It should be perfectly obvious that a man who gives a trifling gift out of good feeling, or from a sentiment of gratitude, does not corruptly give, nor does the person who receives it corruptly obtain. On the contrary hypothesis, it would be wholly impossible to make any present to any person, however great a friend he might be, with whom one had business relations. It would be wholly impossible, or at least very risky, to reward any other person's employé who had done one services in the course of his employment, even though those services had been such, or performed in such a way, that exertions so great could not have been compelled or reasonably expected under the bare terms of his contract of employment. It would be, in short, monstrous to suppose that the Act was intended to create an absolute divorce between the relations of business and the relations of friendship—to make the possession of a business friend a criminal offence.

What then should be understood by "corruptly" accepting or obtaining or giving? We think that an agent corruptly accepts or obtains a gift if his object in accepting or obtaining the gift is to influence his judgment in relation to his principal's affairs, and to substitute for that impartial exercise of his discretion upon his principal's affairs, which every principal has a right to expect, either a partial exercise of his discretion or the exercise of no discretion at all. Similarly, we think that a third person corruptly gives to an agent if his object in giving is to induce the agent to come to some conclusion favourable to the giver in relation to the principal's business, without

exercising an impartial judgment upon the matter. We imagine that in a case of this kind a judge should direct a jury somewhat as follows:—"If, gentlemen, you think that the accused made this present after the completion of this business with no object in view except to show his appreciation of the manner in which the business has been done; if you think that the accused had no thought or expectation that his gift would influence this agent in any other business he might have with this principal, then you ought to acquit. If, on the other hand, you think that the accused gave or agreed to give this gift before the business was complete, in order that the agent might not take that care of his principal's affairs which he would otherwise have taken; or if the accused was accustomed to or intended in the future to do business frequently with this principal, and you think that he gave this gift after this particular piece of business was concluded in order that in the future the agent might not take that care of his principal's affairs which he would otherwise have taken, then you ought to convict."

It is, of course, obvious in this case as in all others where the intent with which an act is done is at issue, that all the circumstances of the transaction and the relations existing between the parties are facts which are relevant to the proof or disproof of the intention in question. We may suppose that the Act will be interpreted in some such way as this. We think, therefore, that there is very little ground for many of the really superficial objections which have been taken to it. They are based to a great extent upon a misreading of its terms.

(ii) We now pass to the second question, how far this Act adds anything to the existing law. Before this Act came into operation the law was by no means powerless against the corrupt agent or the agent's corrupter. If it could be proved that an agent received a bribe in order to defraud his principal, or that anyone knowingly gave to an agent with intent to defraud his principal any false document, and if the agent used that document, both agent and principal could be prosecuted for a conspiracy to defraud. The civil remedies also of the principal are very complete. The principal can compel an agent to pay over to him any secret commission which he may have received as money had and received to his (the principal's) use. If there is any reason to think that the receipt of the commission has in any way interfered with the proper conduct of the agent's duty, the principal can decline to pay the agent his commission, or, if he has already paid it, he can recover it from the agent. This Act seems to add to the existing criminal remedies possessed by the principal in two ways:—(1) Whereas before the Act the principal must have proved a conspiracy between the corrupter and the corrupted agent, now he need prove no conspiracy. All he need show is either that a third person has given, or that the agent has received or agreed to receive, a gift corruptly. (2) Probably before the Act was passed an attempt to bribe an agent which failed, or an attempt by an agent to give a bribe which failed, would not have been a criminal offence. Now such attempts are made crimes of the same magnitude as the completed offence. We must conclude, therefore, that the Act does give a sharper edge to the criminal law dealing with this very prevalent offence. But to admit that it adds a sharper edge to the existing law by no means concludes the question whether this Act, or any Act, will effect what is desired. To determine this question we must discuss the third of the questions which we have proposed for consideration—whether this Act is likely to carry out the intentions of the Legislature.

(iii) The difficulty of dealing with such offences as those dealt with by this Act is the difficulty of detection. In the case of most ordinary crimes, such as murder or theft, it is to the direct interest of the injured person or his family to make every effort to detect the criminal. There is an immediate and apparent injury. There is

the strongest incentive to bring the criminal to justice. But in the case of offences of this nature there is, in the first instance, no apparent injury to anyone. No doubt the principal is injured—but he does not know it. There is therefore no immediate and powerful incentive existing in some definite person to bring the criminal to justice. On the contrary, there is every inducement to the two guilty persons to conceal their offence; and, as one of these guilty persons is a trusted agent, there is every facility for making this concealment effective. Trade could not go on unless credit were given and trust confided in many different directions; and so long as this necessary trust is confided this offence is almost impossible to be detected. In fact, the detection and suppression of this offence is almost as difficult as the detection and suppression of many other offences against morality which the legislator, though he deplures their existence, hesitates to bring within the scope of the criminal law, because the attempt to do so would, as BENTHAM long ago pointed out, cause more evil than it prevented. But it may be said, "When thieves fall out honest men come of their own"—if the corrupt agent or his corrupter fall out there is a chance for the principal; and this Act will considerably add to his powers in this event. In answer to this it may be said that the Act will therefore tend to draw tighter the links which unite a confederacy of thieves, and to render more difficult still the work of detection and suppression. We do not, however, think that this objection is a strong one. In spite of the Act differences will arise between these dishonest persons, and other circumstances beside such a difference of opinion may put the principal on the track. The real objection to the Act, we think, lies in quite another direction. It is not unlikely that it may be used wrongly for purposes of persecution and revenge. Suppose a case of this kind:—A principal knows that his agent is in the habit of receiving commissions from third persons, and either so acts as to cause the agent to conclude that he (the principal) does not mind, or deliberately chooses to take no notice of the practice. Differences arise between the principal and the agent, or between the principal and the third person who has been paying the commission. These differences become acute, and the principal institutes a prosecution under this Act. It will be said that the clauses of the Act which make the consent of the Attorney or Solicitor General necessary before instituting a prosecution; which put the prosecution of an offence under the Act under the restrictions of the Vexatious Indictments Act; which require that every information for an offence under the Act shall be upon oath—will make it impossible for the Act to be thus abused. No doubt these provisions will do something to mitigate the evil which we are considering. Whether they will be sufficient is another question. We cannot expect the Attorney or Solicitor General to do more than satisfy himself that there is a good *prima facie* case; and when the desire for revenge is strong a good *prima facie* case may be made without much difficulty. We always suspect a criminal statute if elaborate precautions against its misuse are needed. It often happens that such a statute does more harm than good—a fact which this Act may unhappily illustrate. We do not think that the Act will touch any but a small fraction of cases in which secret commissions are given and received. We believe that it may lead to the institution of prosecutions from unworthy motives. In proposing to suppress prevalent abuses of this kind by the help of the criminal law, the legislator would do well to keep before him some wise words which BENTHAM wrote upon this matter:—

The penal system, though it be made as perfect as possible, is defective in several respects. (1) The evil must exist before the remedy can be applied. The remedy consists in the application of punishment, and punishment cannot be applied till offence is committed. Every new instance of punishment inflicted is an additional proof that

punishment lacks efficacy, and leaves behind it a certain degree of danger and alarm. (2) Punishment itself is an evil, though necessary to prevent greater evils. Penal justice, in the whole course of its operation, can only be a series of evils—evils arising from threats and constraints of the law, evils arising from the prosecution of the accused before it is possible to distinguish innocence from guilt, evils growing out of the infliction of judicial sentences, evils from the unavoidable consequences which result to the innocent. (3) The penal system is not able to reach many injurious actions, which escape justice either by their frequency, the facility of concealing them, by the difficulty of defining them, or finally, by some vicious turn of public opinion by which they are favoured. Penal law can operate only within certain limits, and its power extends only to palpable acts susceptible of manifest proof.

We are confident that BENTHAM would have condemned the Act upon these principles. He would have said that an Act which would probably be unable to touch the large mass of cases which it was meant to touch—which obviously gave an opportunity to persons to put it into force for unworthy motives—was calculated to do more harm than good. All punishment is, as he rightly says, an evil. It can only be justified if it makes in the long run for the greater happiness of the greater number. We must be careful to see when we inflict new punishments that they will fall upon those whose conduct we wish to penalise. We must not allow our indignation at certain wrongs to so blind us that we make new crimes and threaten new punishments which may not only fail in their object in suppressing wrong, but also make it possible for unscrupulous persons to use the criminal law to gratify their desire to revenge or to oppress.

NATIONAL TRUST FOR HISTORIC PLACES.

IN the next session of Parliament a Bill is to be promoted for incorporating the National Trust for Places of Historic Interest or National Beauty. The Trust is to be established for promoting the permanent preservation, for the benefit of the nation, of lands and tenements (including buildings) of beauty or historic interest, and, as regards lands, for the preservation (so far as practicable) of their natural features and animal and plant life. The present property of the Association is to be invested in the National Trust, which will be divided into (a) ordinary members, (b) life members, (c) honorary members, and (d) local corresponding members. On the Council two members are to be appointed by the Trustees of the National Gallery, two by the President of the Royal Academy, one by the President of the Royal Society of Painters in Water-Colours, two by the Trustees of the British Museum and one each by the Society of Antiquaries, the Royal Institute of British Architects, the Linnæan Society, the Entomological Society, the Royal Botanical Society, the Universities of Oxford, Cambridge, London, Edinburgh, Glasgow, St. Andrews and Dublin; the Commons' Preservation Society, the Kyrle Society, the Selborne Society, the County Councils Association, the Society for the Protection of Ancient Buildings and the Trustees of Public Reservations, Massachusetts, U.S.A. Twenty-five properties now in the possession of the Association are scheduled as to be held and preserved for the benefit of the nation.

EUROPE.

COMMERCIAL EUROPE—WOOL.

THE NEW WAR OFFICE, WHITEHALL.

(See Illustrations.)

"PEACE has its victories as well as war," and we may justly affirm that, in the instance of the new War Office, a victory has been achieved; and this has been obtained in face of many difficulties, many obstructive factors, so that in the successful completion of this fine block we are presented with a curious blending of peace and strife. It is an interesting commentary, too, on any speculation as to the advent of the millennium that this vast building, entailing considerable expenditure, should be erected in the Metropolis of the world in the opening years of the twentieth century. Perhaps, however, it is a wise expenditure, on the assumed wisdom of the dictum that those who seek peace must be prepared for war.

It is well known (and yet must be repeated in any article dealing with these buildings) that the fertile brain responsible for the design of the War Office belonged to the late WILLIAM YOUNG, who unhappily did not live to see even the commencement of his matured scheme translated into permanent materials. It was a sad coincidence that both the new blocks of Government offices should be thus deprived of the services of their respective authors. But though WILLIAM YOUNG was called away, we cannot see any signs that the completed work has suffered under the superintendence of Mr. CLYDE YOUNG (the capable son of a capable father), who has fully justified the confidence reposed in him by the authorities. He has been assisted in his duties by Sir JOHN TAYLOR, K.C.B., of the Office of Works. Mr. FRANK WOODWARD acted as clerk of the works, with Mr. HENRY GRACE as his assistant.

Before attempting a description of the buildings, we would revert to a remark made above as to difficulties and obstructive factors. On the basis of planning, an irregular site of the area under consideration is, perhaps, innocent of giving trouble. It is in the treatment of the elevations and in the consideration of perspective effects that such irregularities are apt to cause difficulties. It may be said at once that the architect has skilfully masked this incipient unsightliness by his treatment of the angles, where the circular towers flanked by square projections and crowned by open stages beneath massive hemispherical cupolas give weight, dignity and a play of chiaroscuro at these angles, thus serving to divert the eye from dwelling on the want of rectangularity of the site. We shall have some further remarks to offer presently concerning these angle blocks.

The desirability of artistic consideration for the Banqueting House has also not been overlooked by the architect; and though this gem of INIGO JONES is of necessity somewhat dwarfed, it is not rendered insignificant by the new buildings, for, as far as internal arrangements permitted, Mr. WILLIAM YOUNG aligned the columns and the main cornice of his structure with

those of the Palace. Indeed, it may be observed generally regarding the completed Government buildings in this thoroughfare, that no one block preponderates unduly, and this is a happy consummation.

The works in foundations were contracted for by Messrs. MOWLEM & Co., who commenced operations in 1899 and completed their contract in March 1901. The entire site was excavated to a depth of 30 feet below the roadway, a concrete tank being formed, 6 feet thick over the base and with walls varying from 3 feet to 7 feet in thickness; the size of this tank may be conceived when the dimensions of the building are considered. The principal (west) front is 250 feet long, the south, east and north fronts being respectively 320 feet, 370 feet and 500 feet in length, the last facing Whitehall Place. The main line of building shows a height of 80 feet above the roadway.

The exterior of the War Office is of best Portland stone, supplied from the quarries of the Bath Stone Firms and specially selected by a Government inspector. All the stone was worked at the Chelsea yard of the contractors for the superstructure, Messrs. FOSTER & DICKSEE. In evidence of the thoroughness with which they entered into the matter, we may note that they had special machinery of the most modern type erected in their yard, including diamond saw, electric cranes and travellers, thus enabling the transmission of the very largest blocks of stone, these being conveyed on motor lorries to the Works, enabling the masonry to be carried out well within the contract time.

The design is Renaissance, dignified and restrained in its tendencies, with due consideration paid to the claims of chiaroscuro. Frankly, however, we must demur, even though the latter quality be the moving factor, to the alternating square blocks and circular drums of the shafts of the columns; the result is an air of restlessness, where one of solid repose is peculiarly desirable. The only other adverse criticism we feel called upon to advance respecting the exterior is in regard to the area gates in the balustrades; instead of endeavouring to treat these as an integral part of the balustrade design, it would have been preferable, both practically and aesthetically, to define their position clearly.

The architectural carving on the façades has been executed by Mr. GEORGE MABEY, and is well worthy of note, and we would call attention to the very happy effect produced by the Ionic colonnading.

Reference was made earlier to the angle treatment. Perhaps it is somewhat of a misnomer to use the term "tower;" derivatively it is decidedly wrong, and in any case it is undesirable. But having so far cleared the ground of misconception, we may remark that whatever term be employed, the effect is admirable. All the fine principles of art in design seem to be concentrated here—mass, proportion, scale effect, chiaroscuro, variegated unity and contrast. The ground and mezzanine floors show a rusticated front, and act as a fitting support for the columnar treatment over, which again adequately supports the superstructure. The main interest attaching to the rectangular flank supports is centred in the sculpture groups, the work of Mr. ALFRED

WAR OFFICE: ANGLE TREATMENT. [Photo by S. B. Bolas & Co., London.]

DRURY, A.R.A., and it is pleasant to observe the seemingly firm foothold devised for the figures; for customarily pedimental figures are—again seemingly—for ever straining to maintain their position on the curved surface. Mr. DRURY has executed eight groups in all, the subjects selected being connected more or less directly with the central *motif* of the buildings; he has designed and executed his work in a thoroughly masterly manner.

The War Office comprises seven storeys from the basement to the so-called fourth floor, and is planned to accommodate some 2,300 officials. Since its in-

the Staff, situated on the Horse Guards Avenue front; indeed, the latter room possesses the finest of the transferred chimney-pieces, and we would call attention to the pleasing carved oak enrichment to the skeleton oval panels intended for the reception of portraits; the frieze in this room would be suitably treated with decorative painting.

As regards the general appearance of the offices, all that can be said is that the treatment has been purposely simple; the rooms for heads of departments are oak-panelled to a height of 4 feet, and every attention has been paid to the adequate convenience and

WAR OFFICE: INNER COURT.

[Photo by S. B. Bolas & Co., London.]

ception changes in the administrative machine of the Department have brought about the abolition of the office of Commander-in-Chief, with the result that the fine suite of apartments overlooking Whitehall Place on the principal floor, destined for that functionary, are now to be devoted to the use of the Council of War and committees; this suite is handsomely panelled in oak from floor to ceiling, and has some fine marble chimney-pieces, transferred from the old War Office. Similar treatment as regards panelling and chimney-pieces is accorded to the Secretary of State's suite overlooking Whitehall, and to the room destined for the Chief of

comfort of all officials. For all the internal wood and stone carving and for the marblework of the principal staircase Messrs. FARMER & BRINDLEY are responsible. A few words should be devoted to this staircase, with its arcade and surrounding gallery at the top. It forms a very fine feature; due mainly to its structural stonework, executed in Painswick stone, the effective alabaster used for imposts and balusters, and the Piastraccia marble steps; we are not so pleased with the effect produced by the Brescia balustrade capping and the Brescia columns at the foot of the staircase, as the contrast is too vivid, but we can con-

ceive nothing happier than the alabaster decoration as employed.

The principal suites are situated on what architects call the first floor, though the Department prefers to call it the second floor (reserving the earlier number for the mezzanine over ground floor), and they are approached by the principal and five other staircases, each of the latter enclosing a passenger lift. There are twenty-two lifts of various kinds (five worked electrically for passenger traffic), and all these have been supplied by Messrs. WAYGOOD & Co.

Enriched ceilings in fibrous plaster, the work of Mr. JAMES ANNAN, are used in the principal rooms; and for the artistic grates two firms have been requisitioned, namely, Messrs. M. FEETHAM & Co. and Messrs. ELSEY. Some of the fine steel grates to be seen are further relics of the old War Office. The stoves and chimney-pieces generally have been supplied by Messrs. YATES, HAYWOOD & Co. The Art Pavements Company supplied the mosaicwork, and Mr. BURGESS (of Liverpool) the wood-block flooring.

The Intelligence Department has been carefully considered, with a view to its isolation, and will be guarded by special gates and officials.

There is complete provision for luncheons, and a mere walk through the rooms devoted to this purpose will convey some idea of the magnitude of the Department. The kitchen and offices, situated at the top of the building, are commodious, and are capable of providing and serving 1,000 luncheons per day; indeed, in times of stress they might negotiate double the number. It may be readily surmised that, everything else being so well considered, the sanitary arrangements are of the most modern type, a commendable feature being the means taken to air-lock the lavatory suites by means of special corridors, cross ventilation and air-extract trunks and flues. Messrs. MATTHEW HALL & Co. were entrusted with this work.

On the occasion of our visit to the new building we found the librarian engaged, like DOMINIE SAMPSON, in the prodigious task of grappling with books and documents; their arrangement will entail considerable time and labour being devoted, but will be facilitated in view of the excellent accommodation provided both in the top-lighted library and in the sub-ground repository, 25 feet high, the latter being situated beneath the quadrangle. Underneath this quadrangle is also to be found the boiler-house, fitted with three boilers, each 25 feet long by 7 feet diameter, and supplied by Messrs. BEELEY & SONS. For ordinary purposes one boiler will suffice, and its use will be alternated with a second, the third being held in reserve. Special provision has been made against the draughts to which stokers are usually exposed. The heating apparatus has been supplied by the Brightside Foundry and Engineering Co. Messrs. SIEMENS BROTHERS were contractors for the electric cables, and Messrs. F. A. GLOVER & Co. for the installation of lights and telephones. Attention may be directed to the interesting brass electroliers in some of the principal rooms, replicas of a chandelier in Hampton Court Palace.

Within the compass of the buildings are residences for five of the officials. In conclusion we may observe that the whole work reflects the greatest credit upon all concerned, our Metropolis being the richer by a magnificent block of buildings.

ROMAN MANCHESTER.

THE excavation sub-committee of the Manchester and district branch of the Classical Association are appealing for funds to continue the excavations now in progress on the site of the Roman fort Mancunium. Between 70 and 80 feet of the foundation of what was apparently the western rampart of the fort (they are not yet far enough advanced to say this positively) and some foundations within the Castellum have just been uncovered in the timber yard

in Duke Place, off Duke Street, which leads out of Liverpool Road, on the left-hand side proceeding from Deansgate. The excavations were undertaken at very short notice on a site which was to be built upon almost immediately. The trenches will have to be filled in by January 5 at the latest.

The work is important. (1) Because the exact position of the western rampart has not hitherto been known (no two maps agreeing on the subject), though fragments of the northern, southern and eastern walls can be located. The discovery of the western boundary therefore determines the dimensions of the fort. (2) Because the remains shown give a clearer idea of the construction of the foundations of the walls of Roman Manchester than was obtainable from the fragment of walling in Messrs. Southern's yard. (3) Because foundations were struck within the enclosure which seem to indicate that the fort had stone buildings. Further details will be given with pleasure to any persons who are sufficiently interested to visit the site. To prevent disappointment, however, it may be better to state that only the foundations remain, and that much has necessarily been obliterated for the time by the snow.

The committee take this opportunity of publicly expressing their thanks for the facilities and kind assistance granted (1) by the officials of the Ship Canal Co. (Bridge-water Undertaking), who own the land; (2) by Mr. Hodgkinson (of Messrs. J. Wainwright & Son, timber merchants), who has hitherto rented the site; (3) by Messrs. E. & F. Beattie, carriers, of Rice Street, to whom they are especially indebted for kindly allowing them to continue the excavation at great inconvenience to the firm.

The depth to which the trenches have to be taken, and the hardness of the material through which they are cut, make the expense of the work very great, and already the funds at disposal are nearly exhausted. They are unwilling to draw upon this year's resources, as they are anxious thoroughly to explore another important site in the summer.

It is not every great city that can boast that the walls of the Roman station to which it owes its name still exist under its busiest streets and the tangle of its many railways. The work now doing is only the beginning of a scheme for gradually piecing together the remains of Roman Manchester that still lie undisturbed beneath the accumulations of many centuries. It is unnecessary to enlarge upon the importance of this work for archæology, for history, and especially in the interests of the rising generation of Mancunians. But the expense is not small, and the sub-committee venture to hope that the results already obtained may induce many who have not yet subscribed to the fund to do so. The expense of publishing such results, with adequate illustrations, is also great, and though there are generous offers from the Lancashire and Cheshire Antiquarian Society and from the Derbyshire Archæological Society, other help is needed. In the temporary absence of the honorary treasurer, Mr. Harold Williamson, donations would be thankfully received by the honorary secretary, Mr. F. A. Bruton, at 2 Clyde Road, West Didsbury.

Mr. Charles Roeder, to whose patient labour for many years it is due that so much of what remained of Roman Manchester has not been irretrievably lost, is not only watching the work with interest, but has voluntarily placed at the disposal of the committee wonderfully detailed knowledge of the site which his long experience and study of it have given him.

AMERICA.

NOTES AND COMMENTS.

THE origin of the name of Liverpool, about which both archæologists and linguists differ, was once more discussed by Mr. SHONE, F.G.S., in a lecture at Chester. It is commonly supposed that the arms express the significance of the title, for a bird is introduced which is popularly called a liver, and the name is therefore the pool of the liver. But the heralds describe the bird as a cormorant having a piece of the seaweed known as laver in its beak. The late Sir JOHN PICTON, the architect, maintained that the bird was the eagle of St. JOHN the Evangelist. Mr. SHONE considers it is more like a herring-gull than an eagle. It is, however, plain that there is no connection between the arms and the title of the city. It has been said the word "Liverpool" is derived from the Cymric "Llyvrpwl," which would signify a pool where rivers joined. According to Mr. SHONE the word was derived most probably from the word "Llifer," which was defined by Dr. W. OWEN PUGHE in the National Dictionary of the Welsh language as a "flux, flow or confluence," and the word "pwl" was a small pool, so that, the letter "f" being equivalent to the English "v," Liverpool would mean exactly what would be the description of the then physical conditions which seemed to be indicated by the geology of the area—a pool in which there was a meeting of the fresh waters and the tidal waters. No doubt the place was known by some name at an early time. But it does not occur in a written deed until the end of the twelfth century, where the place is described as "Liverpul"; the same spelling is adopted in a charter of King JOHN. It is not of much importance to discuss the etymology of Liverpool or the reason for adopting the peculiar coat of arms. But as long as the city exists we suppose the subject will have interest for those who consider the past to be as important as the present.

THERE was a time when Canon GEORGE VENABLES was a familiar figure at archæological meetings. His addresses were anticipated with pleasure, for it was known that he possessed a thorough knowledge of ecclesiology. His death on Sunday will cause regret to all who have heard him or were acquainted with his writings. Born in 1821, after studying at Oxford he was ordained in 1852. He was fortunate in having his merits recognised, and was appointed vicar at Chatham in 1854. From 1874 to 1886 he was vicar of Great Yarmouth, and he aided in the restoration of the church there. Since 1888 he was rector of Burgh Castle, Suffolk. He was the author of several books and very numerous articles relating to church matters. He was an excellent type of the old clerical archæologist—a class of man that is not numerous at the present time.

THE present Italian Government have resolved to adopt stringent methods in order to prevent the sale of examples of ancient art and the destruction of historic remains. Since 1820 regulations have existed for the same purpose. But they were inoperative, for Western Europe and America have been enriched by Italian spoils. It is now proposed to form a Superior Council of Antiquities and Fine Arts, consisting of twenty-one members. All works of art belonging to private possessors will be registered. Should an owner be desirous of selling his property the State will have the right to purchase it within three months. Works of architecture and remains of historic interest are also to come under the protection of the proposed edict. It will become impossible to build on ground which is supposed to have been the site of some historic building or the residence of some ancient worthy. The State will also acquire the right to undertake excava-

tions in any part of the country by paying compensation to the owners of the ground. Associations can also be authorised to embark upon excavations. But if foreigners perform the work they will not be allowed to remove any treasure-trove from Italy. There are other provisions which will also tend towards the retention of works of art within the country.

AN Association has been formed in Paris of former students of the ateliers of the Ecole des Beaux-Arts. The first meeting was held on December 22 with M. BONNAT, the present director of the school, as president. The object of the Association is to endeavour to preserve the fellow-feeling between artists who once were comrades, and wherever practicable to come to the aid of those whose careers have not been fortunate. The Association will also consider questions relating to the Ecole des Beaux-Arts, the salons and other exhibitions, and it is hoped money will be provided for travelling studentships as well as a benevolent fund. Prior to the first meeting, more than 300 applications for membership were received. One lady has presented 500 francs, and Baron EDMUND DE ROTHSCHILD has given 3,000 francs. M. FERNAND SABATTE, who has organised the Association, is honorary secretary. His address is 35 rue Gros, Paris.

It is understood that the recent robberies in the Louvre have led to the adoption of new rules and regulations which are not unlikely to cause some inconvenience to those who visit the galleries with an honest intention. Entrances and exits are to be guarded with more care than formerly. There will be only four doors for admission. But that must mean only to the great galleries. Every door in the interior which is not considered to be necessary for visitors will be kept closed, or, in other words, it will be necessary to follow a certain definite route. Regulations of that kind might be worse, especially as visitors must realise that the treasures cannot be too well guarded. But a rule which gives the officials authority to treat the visitors in the manner that is familiar at the Customs barriers will give rise to much grumbling. The police probably can discover no other way. The select class of artists and scholars who have been allowed special facilities for their studies will find that their privileges have been curtailed.

THE French Government are fortunate in having gained possession of the old château of Azay-le-Rideau. It is situated no doubt at some distance from Paris, in the beautiful district between Tours and Chinon. The château dates from 1520 and was erected by the treasurer of FRANCIS I. The salamander which is associated with the king is therefore prominent on the façade. The L-shaped plan with turrets at the angles is suggestive of a time when defence had to be considered. But the other parts of the building are evidently suggestive of a peaceful age. As a transition example it becomes one of the most interesting among the numerous French châteaux. Unfortunately the name of the architect who designed it cannot be discovered. The sculptors engaged must have possessed extraordinary skill, but not one of their names has survived. From its character and age it is especially suited to become a Renaissance museum, to which use the French Government have assigned it. But what are the limits of that period? The question has been discussed at a meeting of a special commission, and it has been decided that the Renaissance period is to be taken as extending from the end of the Middle Ages to the period of LOUIS XIII. Arrangements will accordingly be made to furnish Azay-le-Rideau with objects belonging to that time.

A ROOM IN A WEST-END HOUSE.

THE HORNBY LIBRARY, LIVERPOOL.

THIS building, as well as collections of books, prints and drawings, form the gift of the late HUGH FREDERICK HORNBY to the city of Liverpool. The collections were described in an article published in *The Architect* on October 19, 1906.

THE NEW WAR OFFICE, WHITEHALL.

(See page 8.)

MANCHESTER ROYAL INFIRMARY.

THE Royal Infirmary (the General Hospital of the city of Manchester) consists of some forty-four buildings, covering an area of about 14½ acres, having frontages to Oxford Road, Nelson Street, York Place and Berlin Street, its main frontage being nearly opposite the Whitworth Museum. We publish the west elevation and ground plan of the staff home, one of three buildings forming the main façade, the others being the administration block in the centre, and the teaching department forming a corresponding block to that of the staff home. We intend to publish the similar plans and elevations of those buildings in our succeeding issues.

The total cost of the hospital, including the out-patients', casualties', pathological departments, &c., will be between 300,000*l.* and 400,000*l.* The buildings are of red brick and Portland stone, and of fire-resisting construction throughout. The staff home contains about 350 rooms, and each nurse has a separate bedroom. The architects are Mr. EDWIN T. HALL, of London, and Mr. JOHN BROOKE, of Manchester. The contractors are Messrs. ARNOLD & SON, of Doncaster, and the clerk of works Mr. ALFRED TURNER.

LANCASHIRE CROSSES.*

IT may be difficult to deprive religious objects of their material character, but they can easily lose their original and essential interest. Removed from their associations they are transformed. The vandals who in the time of HENRY VIII. and CROMWELL destroyed a vast number of works of art, which they considered to be aids to superstition, would have served their purpose equally well if they deposited their objects in museums. In a glazed receptacle the most prized reliquary rarely attracts any reverence. The difference between past and present is nowhere better exemplified than in one of the foreign museums of religions, or in a section of a general museum which is assigned to that subject. The majority of visitors give no greater attention to the cases than they bestow on those containing miscellaneous articles. Vandalism, in fact, attains only negative results, and far more effective substitutes can be found for it.

We cannot therefore help pitying the waste of both physical and mental energy displayed in smashing stone crosses early in the nineteenth century by one of the Lancashire vicars. We are told by Mr. TAYLOR that "he was a vehement Protestant, and owing to his notoriety as a prophet, allowed to do much as he liked with these ancient monuments. Many crosses, indeed, it is said, were pulled down with his own hands." The good people of the district did not realise, nor did the clergyman himself, that there was more debasing superstition in supposing that he was a prophet, and was to be dreaded as a wizard, than in allowing a cross to remain as a relic of the past. Yet it may be doubted whether complete destruction was not preferable to degradation.

* *The Ancient Crosses and Holy Wells of Lancashire*: with Notes on the Pre-Reformation Churches, Monastic Institutions and Superstitions of the County Palatine. By Henry Taylor. (Manchester: Sherratt & Hughes.)

THE HORNBY LIBRARY—GALLERY PLAN.

THE HORNBY LIBRARY—GROUND PLAN.

To break up an old cross for the repair of the streets could hardly be worse than turning one into a lamp-post, as was done in Leyland. In other places the whipping-post and the stocks were supposed to be suitable adjuncts to the cross. Indeed, it may be said that the crosses of Lancashire have been treated like the religious objects in gold, silver and ivory which we see in museums. Their original character is ignored, and if they are regarded at all, it is with wonder that they could at any period have exerted the influence which imaginative people describe as inevitable.

The subject of crosses has received some attention from ecclesiologists, if not from ordinary archaeologists. It is impossible to say to what extent they were scattered over these islands. But there is sufficient evidence to prove they were numerous along the eastern part of England and in the Isle of Man. In Ireland also several still remain, and although they were obnoxious to Scotsmen at the time of the Reformation, when many were likely to have been destroyed, some interesting examples still exist in the north. From the character of the ornamentation it was supposed they were likely to be carved by Northmen or by Celts. But of late years resemblances have been traced between the patterns and some of those found in various parts of Europe, and the circumstance has enabled a theory to be created that the English crosses were inspired by Roman or other Italian influence. One of the examples in Whalley churchyard has been used to support that theory, for it is described in the following words by Mr. HENRY TAYLOR:—

Monument "B" is in a fair state of preservation, although a portion of the shaft (apparently about 2 feet in length) has been lost. Its total height must originally have been some 9 or 10 feet. The arms of the cross (which was about 2 feet in diameter) are missing, but the characteristic central boss at their intersection is present. Sometimes the central boss is plain; in this case it is carved. All four sides are richly ornamented with varying patterns of foliated scrollwork, as shown in the accompanying illustration. The principal ornament on the east and west faces springs from a central rounded shaft or pole, itself rising from the apex of a gable. These two faces are considerably varied one from the other in the character of the ornament. The cross shaft, which measures at the bottom 21 inches by 10 inches, is socketed into a carved base stone. The Bishop of Bristol sees in this ornamentation a resemblance to the work on the roof of the alcoves in the mausoleum of Galla Placidia at Ravenna. He goes on to suggest that this design may have been brought by Wilfrith of Ripon, York and Hexham from Rome and Ravenna, and that it is only a shortsighted view to attribute such work only to Hibernian designers and their imitators.

To ornamentists the scrolls on the stone will appear to have at least as much analogy with the carvings and tattooings of the New Zealanders and other peoples in a primitive state as with Byzantine or Italian patterns. The symmetrical arrangement is so simple it must have been adopted in the earliest attempts at composition. On that account it is difficult to imagine the forms could have had any symbolic signification.

The Whalley example is not to be accepted as a general type of the ornamenting of the Lancashire crosses. There are many varieties, although it cannot be said that the sculpture is ever remarkable for beauty. To be enabled to write Mr. TAYLOR's large volume on the crosses, whatever may be their artistic value, has required several years of close labour. It was necessary not only to seek out the places where crosses or their remains are to be found throughout the county, but, in addition, records and other sources of information had to be carefully studied. Mr. TAYLOR has had the advantage of assistance from local authorities, and his work with its numerous maps and illustrations is one which all Lancashire men, as well as archaeologists, should be proud to own.

It has long been a subject for debate whether the majority of English crosses were not erected prior to the Norman invasion. The general character of the

ornamentation and the inscriptions would support that theory. But there are occasional records which show that examples were raised at a later time. They were intended to serve several purposes. Mr. TAYLOR classifies those found in Lancashire as follows:—(1) Preaching crosses, (2) churchyard crosses, (3) roadside or weeping crosses, (4) market and proclamation, (5) boundary crosses and meare stones, (6) the cross at cross-roads, (7) crosses at holy wells, (8) sanctuary crosses, (9) crosses as guide-posts, memorial and murder crosses. It is not to be supposed that crosses erected at an early date were intended to serve secular purposes. For instance, on some of the Scottish stones battles are represented, and on that account it was concluded that the crosses indicated battlefields. But it is more likely that the rude, warlike scenes referred to some of the Jewish contests, from which at the time spiritual meanings were drawn. The crosses were placed in positions which were supposed to have advantages, and it was not surprising if subsequently one became the centre of a village. They were not always far apart. Some were used to mark the boundaries of churchyards or monastic property. There are, for example, three crosses in the churchyard of Whalley, but we are told "their original position is uncertain," and it is likely there were others, and all may have helped to define limits.

Mr. TAYLOR is of opinion that prior to the Reformation the crosses were intended to recall the Crucifixion. When one had to be rebuilt the style of Gothic then practised was adopted. In the sixteenth century, especially with market crosses, a suggestion was taken from Italy, and "in many cases the structure took the form rather of an obelisk than of a cross, but was often surmounted by an orb with a small, plain, Latin cross on the top of it." In the eighteenth century a crown was substituted for the orb and cross, as in the Salford Proclamation cross and the Manchester Market cross.

The crosses in each of the six Hundreds of Lancashire are described in order, and illustrations are given of typical examples. Although people are becoming more enlightened about the past and the remains relating to it which have survived, there are no traces now of several crosses which must have existed when the Ordnance Surveyors were at work in 1848, for their positions are shown on the maps. It is to be hoped that Mr. TAYLOR's admirable descriptions will prevent further vandalism. When it is remembered that some of the carved stones are a thousand years old, it seems to be almost inhuman to treat such relics as if they had been just taken from the quarry. The holy wells possess less architectural interest than the crosses, but in some cases crosses were found near them, and the legendary lore collected about them has much attraction for archaeologists. The information is not confined to crosses and wells. Particulars are also given about the religious houses which once were numerous in Lancashire, and by the law of association the settlements of northern invaders, the positions of camps, barrows and Druidical remains and much else has had to be considered, and in that way the volume becomes a necessary supplement to the ordinary histories of Lancashire.

M. Philippe Chaperon, who was the senior among the scene-painters of Paris, has died in his eighty-fourth year. For many years examples of his art were sought for the principal theatres of Paris, including the Opéra and Comédie-Française.

The French Academy of Fine Arts have decided that the prize founded to commemorate Achille Leclerc will be given this year for the best design for a metropolitan railway terminus.

Mr. W. Woodward has given notice that at the meeting on Monday of the Royal Institute of British Architects he will direct the attention of the R.I.B.A. to the terms of the competition for the new London County Hall, with especial reference to the proposal to invite certain architects to submit designs in the final stage of the competition.

THE EMANUEL HOSPITAL, WESTMINSTER.

WESTMINSTER is deservedly famous for the number of its charities—quaint abodes of peaceful rest for the aged, and of learning for the young. Not by any means the least amongst Westminster charities was the Emanuel Hospital, standing in a street then known as Little James Street, but now called Buckingham Gate. Passing from Victoria Street to Wellington Barracks it stood on the left-hand side of the road.

On entering the gateway, a fine spacious quadrangle laid out with lawn and gardens, with paved pathway all round, met the view, on three sides of which stood the red brick Queen Anne buildings, the fourth side being screened from the road by high wrought-iron railings with gates of good design; the whole formed a very secluded, picturesque and historically interesting part of old London.

This charming relic of bygone years must indeed have been a harbour of refuge to its inmates, and a pleasant surprise to the wayfarer in what was then a by-street of Westminster.

Emanuel Hospital was originally founded in 1594 by Anne, Lady Dacre, widow of the last Lord Dacre of the South, sister of the poet-statesman Lord Buckhurst, and maid-of-honour to Queen Elizabeth. Lord Dacre's mansion stood close to the site of the hospital, and in the early days of the charity only "decayed and distressed servants of Lady Dacre, former servants of the family who have grown poor, lamed or diseased in the service of their Prince, or without their own default; any poor, godly, honest people past labour, those born blind, or lamed or disabled in the service of their Prince, and those brought down from riches to poverty without their own fault," were eligible.

Lady Dacre's will was proved on June 6, 1595. It provided for the erection of a suitable building on land selected by the testator in Tothill Fields, "about four acres," with habitation for twenty poor aged folk and twenty poor children, and it was to be called "Emanuel Hospital." By the will it was also directed that a charter should be applied for, incorporating the hospital under the name and for the purposes designated.

This charter was granted in 1601, and the almspeople by it were constituted "as a body corporate of themselves for ever, under the name of the Poor of Emanuel Hospital, with faculty to purchase lands, to have a common seal, to sue and be sued." After the death of the surviving executor the Lord Mayor and Aldermen of the City of London were made the governing power in perpetuity.

The first beneficiaries were to be selected to the number of seventeen from Westminster, two from Chelsea and one from Hayes in Middlesex. The two from Chelsea were appointed on condition that the tomb of the foundress and her husband in Old Chelsea Church should be kept in good repair; failing this being done, after due notice being given, the right of Chelsea was to lapse.

The first hospital was erected in 1605; about 100 years later it was rebuilt, and in 1732 the chapel was erected—to which the apsidal chancel was added in 1846. Oddly enough, while expressing the desire that "the children should be brought up in virtue and good and laudable acts whereby they may the better live in time to come by their own honest labour," Lady Dacre did not seem to contemplate a school for the children, but rather a cluster of industrial homes in which each aged pensioner should "bring up and instruct in virtue, and good and laudable acts," one child. However, a school was founded and the first clerical master appointed in 1735.

The Rev William Beloe, the translator of Herodotus, was master of the hospital from 1783 to 1808, when he was appointed rector of Allhallows, London Wall, and assistant librarian in the British Museum.

In 1873 the Endowed Schools Commission carried in Parliament a "scheme" for the reconstruction of this hospital and the separation of the schools from the almshouse branch of charity. Under the provisions of this scheme the endowments of four hospital schools in Westminster were to be united under the management of one body of governors, and out of these endowments it was

proposed to establish three large middle-class schools—two in Westminster, each providing accommodation for 300 boys, of whom 200 in each should pay a small sum for their education, and one a boarding school, which was

erected at Wandsworth and is now known as the Emmanuel College for Boys.

The old "Emanuel Hospital" was pulled down a few years ago and a large block of buildings erected on the site.

COMMERCIAL AMERICA—TOBACCO.

THE LATE J. S. M'CAIG.

THE result of the appeal in the action relating to the will of the late Mr. M'Caig, who left his fortune for the erection of towers and statues, was reported last week in *The Architect*. The *Dundee Advertiser* gives the following account of the testator:—

For many years John Stuart M'Caig and John Stuart Blackie were the two notable figures in Oban. Though they had little in common, they were both somewhat eccentric. John Stuart M'Caig was a striking personality. Tall and portly, a burly man with a majestic presence, a stentorian voice and a forceful style of speech, he was one that could not be overlooked in any company. Though not deeply learned, he was well read, and took special interest in the history of art, frequently visiting the chief continental galleries, and by no means ignorant of both ancient and modern pictures. As might be expected, he was an ardent Gael, even his speech retaining to the last a faint flavour of the pure West Highland accent. One of his sisters conducted for many years a successful west-end millinery establishment in Sauchiehall Street, Glasgow, and he was a frequent visitor there. To those who knew Mr. M'Caig's love of the Highlands and Highlanders it was often matter of surprise that he spelled his middle name "Stuart" in the French style, and not with that multiplicity of superfluous consonants which the Gaelic language demands.

It is probable that only the wide circle of John Stuart M'Caig's friends knew that he was both a poet and an art critic; for the book which he published many years ago, under the title of "Notes on Painters and Painting, with a Poetical Introduction," was never intended for the world at large. As a poet he was not in the front rank. Indeed, much of his verse was not better than fluent doggerel, however sincere were the thoughts he strove to express. A few quotations from his poem on "The Rise of the Fine Arts" will enable readers to judge of its value. It is intended to show the civilising influence of poetry, music, the drama, painting, architecture and sculpture as displayed in the history of Greece, Italy, France and our own country:—

Well and truly are the arts pronounced fine,
For they are the fruit of a breath divine;
By which wit and wisdom to man are taught,
And those wondrous marvels of perfection wrought.
They are the products of that light and love
Which descend on man from the realms above,
And with softer feelings his heart bedew,
And scenes more fair and bright unroll to view,
And with skill and cunning endow his hand
To reproduce those scenes like magic wand;
With song and music to attune his tongue,
So as to enchant and please old and young.

A long passage describes how those gifted mortals, artists and poets, transcend the meaner mortals who have no gleams of genius. Some of the statements, however, may not meet general acceptance, as when he writes:—

Artists and poets have a sense of right,
A keen sense of virtue and honour bright.
Artists and poets, with their feelings keen,
Distinguish the right and wrong in the scene.

After telling how the primitive man gradually came under the influence of the earlier ballad singers and developed more elaborate poetry, he proceeds:—

Then arise at last the masters of song,
Whose rolling verses the ages prolong.
Then Homer, Virgil, and Milton appear,
Whose pages nor death nor decay can fear;
Horace, Burns, and Béranger—full of fire—
Strike with cunning and with rapture the lyre.

Here the poet is somewhat mixed in his chronology, for there are vast tracts of time between Virgil and Milton, as between Horace and Burns; but Æschylus, Sophocles and Euripides are joined with Corneille, Racine, Molière and Shakespeare in an equally rapid survey. Painting begins with Apelles, sculpture with Phidias, and architecture with the builders of the Pyramids and the Parthenon. When dealing with architecture the poet selects Bramante, Michel Angelo and Sir Christopher Wren for special laudation:—

In London Sir Christopher Wren designed
Saint Paul's with the skill of a master mind;
Built in the metropolis of the earth
This temple as a central home and hearth,
Vast and solid in its bulk and structure,
Emblem of the people and their nurture.

The poem concludes with a prophecy and a prayer. The first has not been fulfilled as yet, nor the latter answered:—

Beauty and music shall yet be the poles
On which the world in sweet harmony rolls,
And love shall yet be the atmosphere pure,
In which men shall live happy and secure;
And life eternal shall be the goal,
The end and reward of the pious soul.
And may this my song be the morning star
To herald this glorious dawn from afar.

Mr. M'Caig's "Notes on Painters and Painting" deal with twenty-four of the most famous artists, from Fra Giovanni, Bellini and Da Vinci to Rubens and Domenichino. When noticing some of the works of art in the galleries at Rome and Florence he makes curiously naïve remarks about them. Thus, Jupiter Serapis he describes as "a striking likeness of Mr. John M'Kay of Glenure, Argyllshire." Again he writes:—"The best idea of the handsome figure of ancient Hercules is that of my friend, Mr. G. G. Mackay of Glengloy." Still further, the West Highland eye detects strange resemblances:—"The bust of Zeus is one of the finest and most celebrated extant. It is very like one of the handsomest red-whiskered fishermen of Lochfyne—well-proportioned head with a calm composure." There is a dash of malice in another criticism:—"The statue of Diogenes is a most striking one, and almost a perfect likeness of the late Mr. Potter, Director of the City of Glasgow Bank." The busts of Vespasian and Titus at Florence provoke the remark:—"Both busts have a striking resemblance to the head of the late Mr. M'Calman of Ardochattan." In St. Peter's at Rome he examines "the statue of Paul III., designed by Michel Angelo—a perfect likeness of Professor Blackie of Edinburgh." When enlarging upon the beauties of the bronze statue of Narcissus at Pompeii, the art critic suggests that "the enterprising Oban Railway Company should get a copy put up in their fine glass station at Oban Bay." Quaint, candid, eminently natural are the criticisms of the greatest works of art in the world; not without an untutored perception of beauty, and ever ready, with Celtic fervour, to correlate the best in the ancient European cities to his own distant but well-beloved West Highland home. Peace to the ashes of John Stuart M'Caig. At least he meant to assist in the development of native Scottish art, however whimsical and egotistical were the methods he adopted. The Court of Session has now decided that the Scottish artists must take the will for the deed.

The Anglo-American Executive Committee for the Keats-Shelley memorial have purchased the house in the Piazza di Spagna, Rome, where Keats died. The price paid was 2,400*l.*, besides 240*l.* already paid for the purchase option. A further sum of 1,600*l.* must be raised in order to free the house from mortgage.

COMMERCIAL AFRICA—HUNTING LIFE.

HOLYCROSS ABBEY.

THE Cistercian Abbey of Holycross, which stands on the banks of the river Suir, is one of the most interesting of the monastic ruins of Ireland. It is among the ancient and national monuments in the charge of the Commissioners of Public Works in Ireland, and in the last report there is a history and description of the building.

The abbey is said to have been founded in the year 1169 by Donald O'Brien, king of Thomond, for Cistercians, a reformed branch of the Benedictines, and was the daughter or branch of Nenay (Monasternenagh), county Limerick. It subsequently became a place of great importance. The abbot was styled Earl of Holycross. He was a Baron of Parliament and usually Vicar-General of the Cistercian Order in Ireland. The lands belonging to the monastery formed an earldom.

The ancient name of the monastery of Holycross was Monastair Ochterlamhain. It is said that the change of name to "Holycross" was due to the gift of a portion of the true cross by Queen Eleanor, wife of Henry II., and that one of her six sons, owing to the pious care of the monks, found a place of burial there.

To show the extent and importance of this monastery we find it recorded that, "in 1563 this abbey, with its appurtenances, containing 160 acres of arable land, 60 of pasture, and 2 of wood in the town of Holycross, one ruined messuage, 60 acres of land in the town of Kilkenny, 16 acres in Ballykelly, 2 messuages, 4 cottages, and 24 acres of land in Lisnegonok, 30 acres in Kilcolman, 30 acres in Thurles, in this county, 1 messuage, 62 acres of arable, 6 of pasturage in Ballentenra, county Kilkenny, one close near the town of Carlow, containing a garden, an orchard, and 3 acres of pasture, and 7 acres in Ballysheen and Maynooth, in county Kildare, were granted to Thomas Earl of Ormonde *in capite*, at an annual rent of 15*l.* 10*s.* 4*d.*"

The abbey was legally dissolved in 1536 by the Act passed for the dissolution of the monasteries, but the monks had possession of it at intervals for a considerable time after, ministering in the church until 1633. About this time the abbot, Luke Archer, accompanied by some of the monks took up residence at Kilkenny, taking with them the relic (the portion of the true cross) above referred to. The last abbot was Bernard Lahy (about 1724). At his death one of the monks, named Cormack, claimed the office as his in right of his Order, but his claim was not admitted. He retained a cell in the building until his death in 1572. He was the last of the monks of Holycross Abbey. The seal of this monastery is attached to a deed in Kilkenny Castle, bearing date 1449.

There have been so many alterations and additions from the thirteenth century to the sixteenth, that there is very little of the original work discernible in the church except some portion of the south wall, and the doorway in north-east of cloister, entering the south aisle. The most prosperous period in the history of the abbey appears to have been from the thirteenth century to the fifteenth, and the principal additions were made during that time.

The abbey church consists of a chancel, choir, nave, north and south transepts (with two chapels opening off each transept), north and south aisles and a tower at the intersection of the nave and transepts. The chancel is 23 feet 9 inches long by 22 feet 8 inches wide, and has a groined ceiling with moulded ribs. The east window of the chancel has six lights with tracery heads as shown on the drawings. The sedilia are in the south wall of the chancel. It is sometimes called the founder's tomb. The

latter, however, is on the north side of the chancel. The tower is 22 feet 3 inches by 13 feet 6 inches, and has a groined ceiling with moulded ribs. The choir is 31 feet by 22 feet. The nave is 61 feet by 22 feet 6 inches. The aisles extend from west end of nave to the transepts. The north aisle was lighted by four windows. The south aisle had only one window in the west end. The north transept, 26 feet 9 inches by 16 feet 9 inches, has a groined ceiling similar in character to the ceiling of the tower. Opening eastwards off the north transept are two chapels, 12 feet by 8 feet 8 inches and 11 feet 7 inches by 9 feet 1 inch, with groined ceilings and moulded ribs. The south transept, 26 feet 2 inches by 14 feet, had not a groined ceiling. Opening eastwards off the south transept are two chapels 10 feet 8 inches by 10 feet 5 inches, with groined ceilings and moulded ribs. Between these two chapels is a space formed by a double row of arches and columns erroneously supposed to have been used for waking the bodies of departed monks. There is a detail drawing of this and the sedilia in the Board's annual report for the year 1881-2, and the so-called "waking bier" has recently been reproduced in plaster for the National Museum in Kildare Street, where it may be now seen. There are rooms over the chancel, north transept and the chapels in north and south transepts—the two latter had fireplaces.

The chancel, transepts, chapels, tower, choir and north aisle wall all appear to have been built about the same period—early in the fifteenth century. The doors and windows in the west gable and in the buildings surrounding the cloister garth appear to be of the same date, except the door at east end of the south aisle, which is of a distinct Norman character and probably belonged to the early building of the twelfth century. The windows and door of the west gable and the openings in the buildings at the east and west sides of the cloister garth were insertions, as also the door from the cloister to the west end of the south aisle.

Some time in the nineteenth century the south wall of nave having shown signs of falling southwards, some buttresses and arches were built to keep it secure. The outlines of two of the three original windows which have been built up are seen in the west gable of the nave; they probably belonged to the twelfth century. The wall of the north aisle is of a better class of masonry than that of the older work in the south aisle and is 6 inches thicker. The smaller windows in the north aisle are similar to those in the west gable at the ends of the north and south aisles; they appear to have been built in with the walling, and are not insertions, like the windows of the west gable. The wall of the south aisle is part of the original twelfth-century work; there is a modern buttress built against it, and there are four semicircular arches springing from this wall to the nave wall for the purpose of supporting the nave wall, which was falling southwards. The buttress and arches were, it is believed, built about fifty years ago by the owner of the surrounding property. Two arches of a similar character were built across the north aisle.

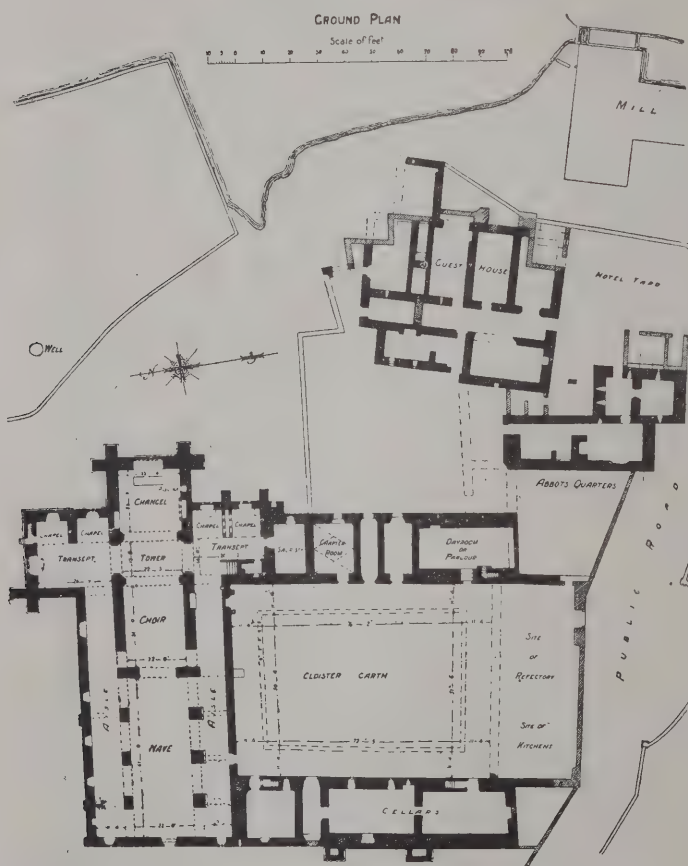

The range of buildings on the western side of the cloister garth contained the dormitory of the lay brethren, with stores and cellars under. There was a range of buildings on the south side completing the enclosure of the cloister garth, but nothing now remains except a doorway 5 feet wide, and the foundation of a wall upon which the present boundary-wall is built. The range of buildings on the eastern side of the cloister garth contained the chapter-room and other rooms and passages on the ground-floor,

with the monks' dormitories over. The masonry of the walls of this portion of the building appears to be a portion of the original work, but some of the cut stonework of the doors is of later origin. Two doorways, one entering the hotel grounds and one adjoining it, are of modern construction.

The cloister arcading was continued around the four sides of the cloister garth, and had disappeared. The original work in it appears to be about fifteenth century. There is only a small portion of it now standing. It was re-erected from the fragments found on the site. The arcade originally was carried around the north, east and west sides, as may be seen by the position of the corbels in these walls; it was also, no doubt, carried along the south side, as indications of the foundation-walls have been recently discovered where marked by dotted lines on the ground plan.

The apartments on the ground floors of the two ranges of buildings east and west of cloisters are vaulted over. The eastern range comprised sacristy, chapter-room, passage from cloisters to the grounds surrounding the abbot's residence; also a small room, 18 feet 6 inches by 10 feet, and a large room, 33 feet by 15 feet 6 inches, which was probably a day-room or parlour. The monks' dormitory was on the next floor. The ground floor of the range on the west side of the cloisters contained three large rooms, which were probably stores and cellars, buttery, &c., and the storey over would be the usual place for the lay brothers' dormitory. There are fireplaces in one of these apartments, which, with the garde-robes, are clearly insertions of a latter date. The refectory was probably at the southern side of cloisters where shown on the plan.

HOLYCROSS ABBEY, Co. TIPPERARY.

The abbot's residence and guest-house south-east of the cloisters contained kitchen, hall, stairs and cellars on the ground floor, and sleeping-rooms and library on the upper floor. The buildings between the abbot's residence and the river on the ground floor comprised vaulted stores, kitchen, dayroom or parlour, with long passage between these rooms and the stores. Most of these buildings were three storeys high. As there were a great number of pilgrims and visitors to the abbey, this building was probably occupied as the guest house. The nave walls are of a rather inferior class of rubble masonry, with pointed arches formed with rough voussoirs. They spring from plain piers without any cap or moulding. There are modern semicircular arches under the old pointed arches in the south nave wall of the same class of work as the arches

across the aisles, and probably built at the same time to strengthen the wall. The arch between the nave and choir is of a similar class of work to that in the old pointed arches in nave walls. The present choir, chancel, transepts and chapel appear to be the work of about the fourteenth or fifteenth century.

The cloister garth and the conventual buildings east and west of it are in the occupation of Mr. Wall, of Holy-cross House. The abbot's house and other residential buildings also belong to Mr. Wall, and were until recently in the occupation of the tenant of the small hotel adjoining. Local tradition has it that the burial ground was at the western side of the abbey. It is also said that the mill was at Bakestown, but it is more likely that the mill was on the site—adjacent to the present mill—where there is an ancient weir. It is to be regretted that the interior of the church is still used as a graveyard, not controlled by any authority. The Board have no power to interfere with the right of burial claimed by large numbers of persons not now resident in the locality and by strangers. This gives the interior a neglected appearance. The conventual buildings are not vested, and are still in the hands of Mr. Wall.

YORK MINSTER.

THE Dean of York has issued a statement respecting the cathedral, in which he says:—

There is no doubt that the disintegration of the surface of the building, and hence the serious and dangerous condition of many of its details, has been due, I will not say entirely, but in a very great measure, to the volumes of sulphurated smoke poured out upon the magnesian limestone of which the Minster is built. The west front was practically refaced at the beginning of the last century, so that this is the work of the past hundred years. Unless the evil is mitigated the costly restoration, which is almost completed, will perish even more rapidly in consequence of the increased and increasing number of chimneys.

No doubt cocoa and sweetmeats, and beer and glass may be essential to human existence, and the railway works to the comfort and convenience of life, but it is a question worth serious consideration whether all these things cannot be equally enjoyed, and the irreparable beauty of Mediæval art and science maintained. "Smoke," we are curtly told, "means business and employment." I think that far more correctly it implies waste, waste of fuel through carelessness, ignorance and false and mean economy. No doubt whatever, the smoke of York might be materially, if not entirely, reduced, to the increased cleanliness and comfort of our homes, as well as to the integrity of the Minster.

Perhaps at no very distant time machinery will be worked by electricity, and our rooms warmed by the same means. The dynamo will take the place of the boiler and the furnace, and motive-power will be generated at some central station outside the city. But until that happy time comes, must we continue to be choked and sullied and blemished with smoke? Is there not an Act of Parliament which, if put in force, would give immediate relief if not absolute cure for all this? It may involve a little extra outlay and consequent expense in factories, but due attention to this is the best practical evidence of good citizenship and good Christianity, and, meanwhile, I would appeal to those who have been the most serious offenders to send substantial contributions to the restoration of the injuries to the Minster which they have caused, even though they themselves may be unable to appreciate the grace and beauty of ecclesiastical architecture.

A Meeting of the Edinburgh municipal art school committee was held on the 27th ult. at which the committee had before them a representation from Mr. Dick Peddie, the architect appointed by the committee to carry out the building of the school, to the effect that, in his opinion, it would not be possible to carry out the plans of Mr. Macgillivray for the sum of 40,000^l, the sum set down as the cost of the buildings, and asking the instructions of the committee as to a modification of the plans to bring the building within the sum set apart. Some discussion took place on the plans, it being pleaded on the one hand that more money could be raised so that the original plans might be carried out, and on the other that the original estimate of the number of students they were likely to have was excessive, and that therefore the scheme could stand modification. It was subsequently agreed that the architect should amend his plans in order to come within the 40,000^l.

ENGLAND IN AMERICA.

THE United States has not as yet acquired a style of architecture which can be claimed as national. The all office blocks differ in treatment. In that way there is a resemblance to most modern nations. The forms which pleased people in a more or less distant age have not lost their attraction, and many of them serve as well in American cities as in the places where they originated.

It is satisfactory to find that American architects and their clients consider that buildings of an English type are appropriate for several purposes. Many mansions are to be seen in districts outside the great cities which recall England. Colleges and schools also bear resemblance to English buildings. It may be said that both England and America were alike indebted to foreigners for the true originals, but America has somehow preferred to retain English adaptations. We publish a few examples taken from recent numbers of the *American Architect*, which will suggest the tendency to take models from among our buildings.

The Fairhaven High School is one of several buildings with which Mr. H. H. Rogers has endowed his native town. Mr. Charles Brigham, the architect, has treated the period of English Renaissance which he adopted as well as could be done in an English office. His windows, it is true, have fewer divisions than are seen in the old residential halls, but the interest of the students had to be considered.

The two doorways of the University of Pennsylvania are of later types, when our carvers had forgotten Gothic traditions and were allowed more liberty. The two works designed by Messrs. Cope & Stewardson suggest the advantage of adopting doorways as memorials. In that way more richness of treatment is likely to be attained than would be attempted in the original plans where economy is generally paramount.

Streets in Boston have their rise and decline like those in various parts of London. Acorn Street, which once was supposed to be "genteel," to employ a word which was obnoxious to Ruskin, fell into so low a state, it resembled, we are told, a London mews. But a reaction followed, and now we learn that Acorn Street, one of the shortest and narrowest streets in the city, has been retentanted by

(Messrs. Cope & Stewardson, Architects.)

lawyers, architects, artists and others who appreciate quiet respectability more than the garishness of "all modern improvements." If we may judge from Mr.

Bourne's restoration it must resemble some of the quiet streets in provincial towns in England, where repose appears to prevail undisturbed from year to year.

ALTERATIONS ON ACORN STREET, BOSTON, MASS.

WHISTLER AS A PORTRAIT-PAINTER.

THE full-length portrait of Miss Florence Leyland (measuring 74½ by 35 inches), by the late J. McNeill Whistler, has been purchased by the Trustees of the Brooklyn Institute of Arts and Science. In an official description of the painting, Mr. W. H. Goodyear, the curator, says:—

To understand this picture it must first be seen, and it cannot be seen unless it is in focus. With an opera-glass we remain in one position and change the focus of the lens. With this particular, stationary picture the focussing must be done by experimental change of distance. An over-close approach will throw the picture, especially the face, out of focus.

Otherwise let it be remembered that art is technically only to be admired for its results and not for its process (aside from the attitude of professional painters). We are all good judges of youth, of innocence, of sweetness of nature, of an unaffected pose, of refinement and of good breeding. If we look for these things in the Leyland portrait, without bothering about "art," we shall surely find them, and in so looking we shall look for all that Whistler wished to show, and we shall consequently discover his art. If Miss Leyland's dress is a neutral gray, relieved with a little black, it is evident that the artist did not wish to interest us in the clothes of the young lady, and why should we refuse to take this hint as to her more spiritual perfections? If the figure emerges from a dark background, without any sort of accessory furniture, it is evident that the artist wished to interest us in Miss Leyland alone, and not in his undoubted ability to paint furniture. Why, then, should we not concede the reasonableness of this mood? As to character, tastes differ. Some may prefer the "Lady in Gray" of the Metropolitan Museum, a water-colour only 10 inches high, of brilliant colour in spite of the title, and a masterpiece in spite of its size. There the attitude is bold, here it is modest. There is nothing retiring, to say the least, about the "Lady in Gray." Having once convinced ourselves by knowledge of this little water-colour or by memory of the "Princesse du Pays de la Porcelaine" as seen at the Chicago exhibition (originally the central feature of the "peacock-room") that Whistler delighted in strong colours as well as in sober ones, we shall return to the portrait of Miss Florence Leyland with sincere approbation of this modest dress, for her, in a picture. For let it be remembered that Miss Leyland was a young lady, and that Whistler's pictures

were generally shown at public exhibitions. Why, then, should the lady not be as reserved in demeanour and as quiet in her dress as she would have certainly been when she herself appeared in public?

Mr. Whistler's own views of the methods followed in his portraits, as stated below, are quoted from his "Gentle Art of Making Enemies":—

"The notion that I paint flesh lower in tone than it is in nature is entirely based upon the popular superstition as to what flesh really is, when seen on canvas, for the people never look at nature with any sense of its pictorial appearance, for the reason, by the way, they also never look at a picture with any sense of nature, but unconsciously, from habit, with reference to what they have seen in other pictures. Now in the usual 'pictures of the year' there is but one flesh that shall do service under all circumstances, whether the person painted be in the soft light of the room or out in the glare of the open. The one aim of the unsuspecting painter is to make his man 'stand out' from the frame, never doubting that, on the contrary, he should really, and in truth absolutely does, stand within the frame, and at a depth behind it equal to the distance at which the painter sees his model. The frame is, indeed, the window through which the painter looks at his model, and nothing could be more offensively inartistic than this brutal attempt to thrust the model on the hitherside of the window. Yet this is the false condition of things to which all have become accustomed, and in the stupendous effort to bring it about exaggeration has been exhausted and the traditional means of the incompetent can no further go. Lights have been heightened until the white of the tube only remains shadows have been deepened until black alone is left. Scarcely a feature stays in its place, so fierce is its intention of firmly coming forth; and in the midst of this unseemly struggle for prominence the gentle truth has but a sorry chance, falling flat and flavourless and without force."

It was a phase of the principles and practice above described that Whistler invariably designed his own frames and did this with the greatest care. Thus even this detail of his art has great importance and should not be overlooked in the present instance. The canvas is also in perfect condition.

The best things (aside from Whistler's own remarks) have still to be said, or to be left unsaid, about this picture. The greatest modern artists have all aimed at a certain mystery and reticence of effect. That all parts of a picture should be equally clear, and that all should be

exactly defined and literally detailed, is equally contrary to the laws of vision and (in modern art) to the suggestions of good taste. The quiet repose in colour of Whistler's portraits in black and gray is a marvellous means to the suggestion of that spiritual repose which is the first condition of spiritual aristocracy, as it is also the invariable trait of social aristocracy. To this repose is added a subtlety of treatment which approaches and reaches the effect of optical mystery. This mystery lies in the gradations of neutral tone by which the figure melts into the background and coalesces with the surrounding atmosphere, without the definition of separated and separating lines and surfaces (which are never seen in nature, though they generally are seen in pictures). So, too, that effect of distance behind the frame, which Whistler announces quite logically as necessarily equal to the distance at which the artist sees his model, is obtained by an absence of linear sharpness in the details of the face and figure. Thus, it may be presumed, is to be explained that marvellous calculation of effects which positively forces the observer to remain at a certain distance from the canvas, for the face falls out of focus as soon as we approach it closely. Thus Whistler has deliberately forced his attentive and careful spectator into the proper position for observation. It may easily be that the habit, so common to the public, of studying pictures at close range, has impeded the comprehension of Whistler, for not all eyes are trained to seek for the point of view which the artist wished them to take. Nor is the taste for optical mystery, either in painting or in nature, as widespread as the comprehension of Whistler's point of view would make desirable. His interest in "Nocturnes," that is, in night effects, is, of course, notorious, and in this search for the effects of visual mystery lies, beyond doubt, the greatness of his daylight pictures, however difficult of apprehension some of his "Nocturnes" themselves may be, when considered as subjects within the desirable range of the painter's art.

In face of the complaints formerly made that Whistler's portraits were unfinished it is easy enough, when standing before the Leyland portrait, to understand such complaints and easy enough to realise, what all critics now know, that his pictures are in reality marvellously finished. That some of his pictures, notably the Florence Leyland portrait, almost suggest a disembodied spirit, an "astral form," or in plain words a ghost, is their greatest charm. Many of George Fuller's pictures have a similar effect, although the pictures themselves are of such different character. Fuller's figures often appear as though they were seen through a gauze veil. Albert Ryder obtains his mystery by the low tone. In Monticelli's revels of colour still other devices obtain a similar optical mystery. Monet and the true impressionists all have the same aim of visual mystery. These comparisons are sufficient to show that in the scope and methods of his art Whistler is one of many moderns, although at times, perhaps, the greatest, as certainly he was among the first.

It is fairly well known that Whistler was not over patient with the critics whose vision was not as well trained as his own. That magnificent repose which inspires his portraits is not especially apparent in the "Gentle Art of Making Enemies," and the world would be the loser had it been otherwise. That Whistler was a kindly and genial soul with those who did not tread on his toes or knock the chip off his shoulder is clear enough. Doubtless he would have been more than tolerant with the public which thinks it sees and does not, if his critics had not sinned in the same way. That these critics were laid low in the dust by this free-lance of the brush and palette will long delight those other adepts in the gentle art of making enemies who have not written such good books in reply, and who have occasionally been pierced, possibly at more vulnerable points, by the shafts of criticism. Thus we will let Whistler speak for himself, in his own fashion, on the great and true doctrine that the bulk of men do not know what they see, and that they only know what they think they see, and that it is the business of the artist to help them and to teach them the theory and practice of vision. This was Whistler's idea of the "whole duty of man" as a painter. Doubtless there are many other duties, but this was his duty as he understood it, and this much may be conceded safely, that, as far as vision is concerned, Whistler was master of the theory of his subject, and that, as far as the practice of this theory is concerned, he has had no superior in modern art. The passage already quoted thus continues:—

"Could the people be induced to turn their eyes but for

a moment, with the fresh power of comparison, upon their fellow creatures as they pass in the gallery, they might be made dimly to perceive (though I doubt it, so blind is their belief in the bad) how little they resemble the impudent images on the walls, how quiet in colour they are—how 'gray,' how 'low' in tone. And then it might be explained to their rivetted intelligence how they had mistaken mere-triciousness for mastery, and by what mean methods the imposture had been practised upon them."

Doubtless the "Gentle Art of Making Enemies" has been well named, but let the world take heed to it that it does not mistake its best friends—the men who tell the truth.

THE AMERICAN CONVENTION.

THE Convention of the American Institute of Architects, at which Sir Aston Webb, R.A., will receive the first Institute medal, will be held in Washington on Monday, Tuesday and Wednesday of next week. On Wednesday there will be a reception at the Octagon House and the unveiling of a bronze tablet in honour of the founders of the Institute. On the same evening a formal banquet will be given, to which will be invited distinguished representatives of the Government, the Fine Arts, Literature and Education. Each member of the Institute is entitled to attend upon payment of 15 dollars per cover, and may suggest to the dinner committee the name of one guest, for whom the member will pay an equal amount.

The *American Architect* has the following comment on the charges:—

We are asked to "comment indulgently" on the price that will have to be paid by those members of the American Institute of Architects who attend the banquet at the coming semi-centennial celebration in Washington, which is to be made memorable by the bestowal of a gold medal on Sir Aston Webb. Without debating the question whether a man who spends 15 dols. on a meal is indulging or over-indulging, we will point out that if "banquets" are to be the rule the Institute will soon cease to be a democratic body, simply because it has become an oligarchical one, for only those who can afford to waste money needlessly will find themselves attracted to these occasions, and money is not always the equivalent of worth. Members who, because they are not elected delegates, have to pay their own expenses are already feeling themselves alienated and discriminated against, and it seems unwise to foster this feeling. Moreover, it is questionable how far the exchequers of the several chapters may be drawn on at the whim of the Institute's chance committees who are charged with preparing and carrying out the programme of "entertainment." For example, the Boston Society of Architects finds it a rather heavy draft to meet the expenses of the score of men it sends to the conventions as delegates, and those of its members who have to stay at home will hardly relish the withdrawing from the treasury of 300 dols. more for a single meal, when there are so many other more desirable uses that could be made of the money. On the whole there seems to be a certain likeness between the proposed banquet and a certain notorious insurance dinner given to a French ambassador and "charged to advertising."

The Government of the United Provinces of India have sanctioned an estimate amounting to Rs. 39,954 for restoring the inner Delhi Gate in the Fort at Agra. The work is, however, not likely to be taken in hand for some time yet, as funds are not available at present.

The Dean of Canterbury has received a letter from an old scholar of the King's School, Canterbury—a school in its origin coeval with the cathedral—in which the writer says:—"I note that about 4,000*l.* is required to defray the cost of the works at present in hand and is urgently needed. I shall be very pleased to find 500*l.* of this if seven others will find an equal amount."

Mr. Thomas Graham, an honorary member of the Royal Scottish Academy since 1883, and who has long been resident in London, died last week in his sixty-sixth year. He was a native of Orkney, and received his art education in Edinburgh. His first picture at the Royal Academy was in 1863. Since that time he was a regular exhibitor in London, Edinburgh and elsewhere. He painted *genre* and portraiture.

COMMERCIAL AMERICA—SPOILS OF THE PRAIRIES.

THE PERIGUEUX DISTRICT.

THE city of Périgueux, writes a correspondent in the *Irish Times*, is well worth a visit. There are in reality two towns. The older and more picturesque, with its narrow streets and still narrower lanes, lined with fourteenth and fifteenth century houses, clusters round the cathedral of St. Front, and forms a square whose entrance side lies on the banks of the Isle; whilst the new town, built upon what was the Vesuna of the Romans, is distinguished by its broader alleys and more modern houses. The cathedral is not only the finest Byzantine church in France, but one of the most magnificent in Western Europe, modelled, as the church has largely been, on the same lines as St. Mark's in Venice.

Many stories have been told of its origin, which some writers have assigned to the fourth century, a date anterior to the construction of Santa Sophia in Constantinople. Count de Montalembert, in his "Catholicism and Vandalism in Art," argues that the principal portions of the church, with the exception of the tower, must have been built before the tenth century, whilst on the other hand M. de Vernheil contends that the cathedral dates from some time between 1010 and 1047, and bases his opinion on the date of the construction of the basilica of St. Mark as well as on those contemporary records which speak of the visit of the then Bishop of Périgueux to the Holy Land. The problem is rendered all the more difficult by the presence of the Pointed arch, which has never been seen in this form in any church anterior to the eleventh century. The question is still unsettled. Most authorities are, however, now agreed in regarding the church consecrated in 1047 as having been mostly destroyed by the fire which wrought such havoc in 1120. In this case the actual cathedral must have been built between 1125 and 1150 on what was then left of its predecessor.

The church of St. Front assumes the form of a Greek cross, whilst the roof is vaulted with five large arched cupolas resting on massive square pillars, which are in their turn supported by the walls of the church, to which they are joined by massive stonework pierced with apertures also cut in the form of Greek crosses. The belfry, which rises to a height of 210 feet, is composed of two massive towers, the one rising from above the other, the upper one being supported by a circular row of columns with an oblong dome at the summit. The apse, which is Romanesque, is quite modern. Massiveness is the most prominent feature of the building, and enables it to dominate effectually the whole town. The interior is just as foreign to the south-west of France as the outside, and must strike the antiquarian as equally out of character with western architecture whether he considers the Oriental cupolas, the heavy pillars, the massive arches or the dim religious light which the windows cast upon the whole fabric. Then again, though St. Mark's was evidently the original model, St. Front can boast of several characteristics peculiarly its own, such as the crypts, which do not exist in Venice, and whose presence is favoured here by the peculiar conformation of the soil, and the lighting of the dome, which has four large windows instead of those numerous lights so often found in purely Byzantine churches. Then the tower, which is quite distinct from any other of its kind, was evidently constructed by the architect from his own special design, and, if of the same date as the church, presupposes an inventive genius wholly in advance of the age in which he lived.

So much for the cathedral of St. Front itself, which, however, was originally the abbey church, and only attained its present dignity when the church of St. Etienne had been partially destroyed by the Huguenots. This building, which dates from the eleventh century, has only been partially restored. Of the three cupolas which at one time surmounted the nave and choir, only two now exist in their entirety. One of these was reconstructed in the

seventeenth century. A fine baptistery in the florid Roman style and three altarpieces in carved oak, dating also from the seventeenth century, are its most prominent features. The tower of Vesuna, which once formed part of the temple dedicated to the titular goddess of the town, is a relic of the period of the Roman occupation. Nothing now remains but the brickwork, as the last portions of the original red and green marble outer lining have now been transported to the museum. There are many other relics of the Roman and Mediæval ages, such as the amphitheatre, the "Tour Mataguère," the churches of St. Martin, St. George and St. Ursula, and finally the Château Barrière, originally part of a Roman house, but remodelled in the tenth, the twelfth and the sixteenth centuries.

Brantôme is reached by a tramway, and lies some twenty miles to the north of Périgueux. It is built on an island formed by the two arms of the Dronne, and is celebrated for its abbey as well as for the exquisite beauty of its situation. Thus the belfry, which is quite separated from the monastery, and dates from the eleventh century, rests on a foundation of natural pillars, part of the original rock, as well as on marble columns. The Romanesque church has been restored by Abadie, and consists of a fine nave, formerly surmounted by two cupolas. The other monastic buildings were turned into the Town Hall schools in the eighteenth century. The tramway runs from Brantôme to Saint Pardoux-la Rivière, and gives the tourist an ample opportunity of gauging all the beauties of the Valley of the Dronne.

Bergerac, on the other hand, which lies to the south of Périgueux, is prettily situated on the banks of the Dordogne. It is not, as has frequently been done, to be confused with the home of the illustrious Cyrano, who lived much nearer Paris. It now carries on a thriving business with Bordeaux, but the old town still preserves many relics of its past, such as the "Château of Henri IV.," which dates from the sixteenth century. A little further east, Sarlat is, after Périgueux, the town which has preserved most of its old characteristics, with its small lanes running into narrow streets lined by houses that have altered but little since the Middle Ages. The old cathedral, built in the eleventh, was restored in the fifteenth century, and has a fine belfry in the form of a campanile. The nave is supported by large round pillars, whilst the wood-carving, especially that of the choir stalls, is extremely fine. The valley of the Vézère is also most picturesque.

Terrasson rises in a series of terraces above the river, which is at its best between this and Montignac, a primitive village which the railway has only thrown open to the tourist within the last few years. It would be easy to dwell at much greater length than I have done on the many other beauties of the Périgord, on the churches of Agénac, Beaumont, Bussières-Badil, Cadouin, Cénac, Cercies, Grand Brassac, Monpazier, Rouffignac, St. Amand de Coly, St. Avit-Sénieur, St. Jean-de-Col, St. Privat, St. Croix and Tayac; on the gates of Domme, on the châteaux of Mareuil-sur-Belle, Hautefort and Michel Montaigne, and on the keep of Vernode, most of which date from the twelfth and thirteenth centuries, and contain features that are rarely found elsewhere. Prehistoric remains lie scattered along what Rudyard Kipling calls "the banks of the lost Dordogne," and elsewhere throughout Périgord, which is far richer in this respect than many other much more frequented parts of France. When, in addition to these many attractions, we remember that Périgord is the home of the truffle, and exports those celebrated "pâtés" made of truffles and partridges, and that these are served at luncheon and at dinner in almost every wayside inn, we hardly understand how one of the most interesting countries in France is so little visited by the tourist and the lover of the picturesque. This very fact must enhance its attractiveness to those who are always seeking fresh scenes off the beaten track,

especially when we remember that Périgord is near Courtras, on the main line from Paris to Bordeaux, to Pau and Biarritz. It can also be reached direct from Paris by Limoges. The tourist then leaves Victoria at 9.5 in the evening, and arrives at the Gare du Nord at 5.50 the next morning. He must then travel by the 10.17 train from the Gare d'Orsay, which reaches Périgueux at 6.51 in the evening. The day service from London is much quicker, as it lands the passenger at Périgueux at 3.27 in the morning, eighteen hours from Charing Cross.

TESSERÆ.

The Earliest of English Architectural Treatises.

"THE First and Chief Grovndes of Architectvre vſed in all the auncient and famous monymentes: with a farther and more ample diſcourſe vpon the ſame, than hitherto hath been ſet out by any other. Publiſhed by Ihon Shute, Paynter and Archytecte. Imprinted at London in Fletſtrete nere to Sainct Dunſtans church by Thomas Marſhe, 1563." Such is the title of the earlieſt English treatiſe on architecture that is known to have been publiſhed. The title-page has a border of cupids and arabesques, bearing the mark of the deſigner or engraver, and alſo of the bookseller (?) for whom it was originally executed. The author, John Shute, was a limner or miniature painter in the ſervice of the Duke of Northumberland, who in 1550 ſent him to Italy to ſtudy architecture, and on his return he ſhowed the drawings he had made during his travels to Edward VI. The volume, a ſmall folio, contains only 42 pages of text—title, dedication and preface included—and five full-page engravings repreſenting the Five Orders, with human figures to illuſtrate their ſuppoſed origin, theſe laſt drawn in a better ſtyle than uſual in English books of that period. It is dedicated to Queen Elizabeth. In his preface "unto the loving and freindly Readers" he exalts the ſtudy of *Architectura*, which he thinks not "altogether unfite nor unaptlie by me termed in Engliſhe, the arte and trade to rayſe up and make excellent edifices and buildinges. . . . without a meane acquaintance or underſtanding in which neyther paynters, maſſons, goldſmythes, enbroderers, carvers, joynars, glaſſyers, gravers in all maner of metalles and divers others moe can obtayne anye worthy p'aiſe at all." He goes on to ſay that he had diligently read all the Latin, Italian, French and Dutch writers on the ſubject, and had alſo viſited and examined the moſt excellent buildings in Rome, and the other moſt notable places of Italy. In the firſt chapter of his work the author tells how the ſcience of architecture increaſed, excuſing himſelf for beginning his hiſtory only after the Deluge by premising that "of all ſuche order and forme of buyldinges as were before Noes fludde, it ſhall not nede to make rehersall." In the ſecond chapter Shute lays down "what the office and duetie is of him that wyl be a perfecte architecte or mayſter of buyldings." Firſt, he "ought to be a very good grammarian, then to have experte knowladg in drawing and protracting the thinge which he had conceived;" thirdly, he muſt have "a good ſight in geometrie, conſequently in opticke and in ſuche lyke ſciences; likewise in arithmeticke he muſt be very parfaiect, and in hiſtories ſingularly wel ſeene; he muſt alſo have a good ſighte in muſycke and ſome knowlaige in phyſicke, not altogether ignorant in aſtronomie; he muſt alſo beſides all theſe ben philoſophie very experte." The neceſſity of which knowledge he ſets out at length, ſo much ſo that in his treatiſe on the "five antique pillers or columnes" he has taken for his principal guide Vitruvius, ſupplementing his dicta with remarks taken from the works of Sebastian Serlius, of Bologna, and the annotations of Philander. Eight ſmall cuts in the text illuſtrate the Attic pillar and the "chaunge of the five pillers orderly to be uſed eche of them in his kynde."

Athens and Rome.

It is fortunate for us that we have more remains of the two cities where architecture was carried to the greateſt perfection than of any other. The immenſity of Rome and the vaſt multitude of public buildings which adorned it might lead one to expect that we ſhould meet there with more remains than elſewhere, but Athens never was a very large city, nor do the public buildings in it appear to have been conſtructed on a larger ſcale than in many others. In each of theſe cities we probably ſee the remains of ſome of the fineſt examples. Judging from the fragments found

at Rome, we may pronounce that there were many other buildings of great beauty, but none which we could wiſh to exchange for the temple of Mars Ultor, of Jupiter Stator, of Jupiter Tonans, of Antonius and Fauſtina, or for the portico of the Pantheon. The temple of Jupiter Capitolinus was indeed larger than any of theſe, but we may doubt if its architecture were better, or even ſo good. In Athens there are fewer objects to diſtract the attention, and we may be aſſured that the Parthenon, the Erechtheum, the Propylæa and the temple of Theſeus were the principal objects of beauty in the time of Athenian ſplendour, and if there were others which rivalled, there were none which pretended to ſurpaſs them. That we have remains of the beſt edifices of Hadrian and Herodes Atticus is not quite ſo certain, but we know from ſeveral examples that architecture had fallen at that period from the dignity and purity which it poſſeſſed in the time of Pericles. Roman buildings occupied in many inſtances points of land advancing into the general line of the valley of the Tiber. The ſpectator was in the centre, the objects were round him. In Athens it was exactly the reverse; the objects were grouped together on a hill in the centre, which diſplayed its magnificence on every ſide. At Rome the beholder was dazzled by the multiplicity of objects. At Athens he was impreſſed by their ſimplicity and unity, for, from every point of view, the public edifices which crowded the ſummit and were diſpoſed on the ſlopes of the Acropolis would combine to form a ſingle whole. In both nature and art ſeemed to have united to produce an harmonious effect, and even in the ſtyle of architecture the richneſs and grandeur of the Roman and the grace and elegance of the Athenian ſeem alike ſuited to the diſpoſition of the buildings and the ſtations they occupied. It is remarkable that both theſe cities ſhould have been ſo admirably placed. Paris hardly offers a ſingle marked ſituation; Naples would have been better had ſome of its principal edifices occupied the Chiatamone; Milan is on a flat; Florence merely in a fine valley. London would be preferable to any of theſe for the diſplay of architecture, but we have taken no advantage of the ſteep bank riſing from the Thames, which, though rather too low, would nevertheless afford admirable ſituations for public buildings. At Rome the buildings are numerous and very much decayed; at Athens they are few, and much more perfect. Indeed, the mere laſe of time ſeems to have had very little effect on thoſe of the latter city. Earthquakes have ſhaken, exploſions have ſhattered, and avarice has deſpoiled them, but a great deal of what remains remains abſolutely perfect, except in the more delicate and expoſed ſculpture, and even of the ſculpture a conſiderable portion is as freſh as if it were only juſt finiſhed.

The Supposed Portrait of Phidias.

A peculiar intereſt attaches to the marble copy of the ſhield of Athena, now in the Britiſh Muſeum, from the fact of its corroborating, with ſlight modifications, the ſtatement of Plutarch that Phidias had introduced among the Greeks fighting with the Amazons on it portraits of himſelf as a bald-headed old man, and of Pericles with his arm ſo raiſed as to conceal part of his face. If there was concealment in one caſe, it may be preſumed that there was the ſame reaſon for concealment in the other, and on this account we may well hesitate to accept the figure on the ſhield as a portrait of Phidias. Beſides, the copyiſt has evidently made the moſt of it, knowing the intereſt which belonged to this figure of the artiſt. The ſtory was that for the crime of introducing theſe portraits on the ſhield, Phidias was thrown into priſon and died there. Yet the obnoxious portraits remained, and to account for this it was further told that they had been ſo fitted into the ſhield as not to be removable without bringing about a collapse of the whole ſtatue. Again, it was neceſſary to explain why Phidias had ever thought of portraits. It was becauſe he was not permitted to inſcribe his name on the ſtatue, as he afterwards did at Olympia. In their ſimplicity the inventors of this tale had not conſidered that in ordinary circumſtances there would have been no queſtion of inſcribing the artiſt's name till after the reliefs on the ſhield had been finiſhed. Pausanias, who deſcribes the ſtatue, not only makes no mention of thoſe portraits, but in another place expreſſly cites a figure by Phidias as being, to his knowledge, the only example of portraiture by him. An inexplicable difficulty therefore ſurrounds the exiſting copy of the ſhield.

The Winter Exhibition of the Royal Academy will be opened on Monday next.

Correspondence

The London County Hall.

SIR,—In consulting about the new offices for the London County Council it seems desirable to consider the designs of Inigo Jones for a palace at Whitehall.—Yours truly,

ROBERT GLADSTONE.

Woolton Vale, Liverpool:
December 29, 1906.

Rural Housing.

SIR,—In your article last week on "Housing of the Working Classes" you have, like many other publicists, failed to point out what was the principal obstacle to the erection of a better class of cottages for agricultural labourers. Tradition was in favour of that form of dwelling, and no doubt it had some advantages. But in many districts it would have entailed less expense if half a dozen families would agree to live in one house. That is, however, not the point which I propose to notice. Landed proprietors are not, and I believe never were, more cruel to those in their employment than the manufacturers in towns. But they were and are less free to act according to their desires. A manufacturer, who generally is the architect of his own fortune, can, if he is in the mood, purchase a slum and substitute satisfactory buildings for the hovels. Having gained money, he can spend it wisely or unwisely. A man who has inherited an estate is, on the contrary, hampered in many ways. He merely holds it for the benefit of his heirs. A great many eyes are watching him, although unobtrusively, to see that he does not depart from custom or allow his feelings to get the better of him in raising money to make poor people comfortable. Of late years there is more liberty allowed for benevolence, but it is expected to be exercised without any sensible addition to the burdens on the estate.

Knowing the restraints which are upon him, and from which he cannot escape, it is only natural for a man to appear as rebelling whenever some petty representative of authority or some fireside philanthropist, strong in the exercise of speech, points to his property as if it were the plague spot of the county. No doubt matters are made worse by the opposition, but neither in town nor country are men always guided by pure logic.

I happened, before reading your article, to be looking through Macaulay's speeches in the House of Commons, and in one of them I found a passage which expresses the disturbed mind of many an estate owner when in their tactless manner the sanitary authorities began as if they were despots, and proprietors had no option but to meekly obey them. It was delivered in May 1846, and as it is not inapplicable to-day, it is worth reprinting.—Yours truly,

A LAND AGENT.

(Macaulay on Sanitation.)

I have just read a very interesting report signed by two members of that Government, the Duke of Buccleuch and the noble earl who was lately Chief Commissioner of the Woods and Forests, and who is now Secretary for Ireland (Lord Lincoln); and since that report was laid before the House the noble earl himself has, with the sanction of the Cabinet, brought in a Bill for the protection of the public health. By this Bill it is provided that no man shall be permitted to build a house on his own land in

any great town without giving notice to certain commissioners. No man is to sink a cellar without the consent of these commissioners. The house must not be of less than a prescribed width. No new house must be built without a drain. If an old house has no drain the commissioners may order the owner to make a drain. If he refuses they make a drain for him and send him in the bill. They may order him to whitewash his house. If he refuses they may send people with pails and brushes to whitewash it for him at his charge. Now, suppose that some proprietor of houses at Leeds or Manchester were to expostulate with the Government in the language in which the Government has expostulated with the supporters of the Bill for the regulation of factories. Suppose that he were to say to the noble earl, "Your lordship professes to be a friend to Free Trade. Your lordship's doctrine is that everybody ought to be at liberty to buy cheap and to sell dear. Why, then, may not I run up a house as cheap as I can and let my rooms as dear as I can? Your lordship does not like houses without drains. Do not take one of mine then. You think my bedrooms filthy. Nobody forces you to sleep in them. Use your own liberty; but do not restrain that of your neighbours. I can find many a family willing to pay a shilling a week for leave to live in what you call a hovel. And why am not I to take the shilling which they are willing to give me? And why are not they to have such shelter as, for that shilling, I can afford them? Why did you send a man without my consent to clean my house and then force me to pay for what I never ordered? My tenants thought the house clean enough for them or they would not have been my tenants; and if they and I were satisfied why did you, in direct defiance of all the principles of Free Trade, interfere between us?"

GENERAL.

Mr. Henry Simpson Legg died on December 23 in his seventy-fourth year. He was district surveyor of Mile End Old Town during several years.

Plans have been prepared by Mr. David Barclay, architect, Glasgow, for a school of textile industries which is to cost 10,600*l.*, and is to be erected in Dunfermline at the cost of the Carnegie Trust and the Scotch Education Department.

A Statue of Bernardin de Saint-Pierre is to be placed in the Jardin des Plantes, Paris, a sum of 2,000*l.* having been bequeathed to pay for it. The commission was given to M. Holweck.

The Frescoes in Manchester town hall are fading under the influence of the local atmosphere, and it is suggested that they should be covered with glass as a protection.

The Municipal Council of Paris propose to demolish during this year 5,263 houses which are supposed to be unfit for habitation.

A Fire occurred on last Saturday in the famous mansion of Jacques Cœur at Bourges, which is used as a palais de justice, but fortunately did not extend beyond the part used as a tribunal de commerce.

The Reports of the winter meetings and summer excursions of the members of the Upper Norwood Athenæum during 1906, which appeared in *The Architect*, have been reprinted in a handy volume. It forms the thirteenth of the series, and is equal in interest to any of its predecessors.

The Fourth Ordinary Meeting of the Liverpool Architectural Society will be held on Monday, the 7th, at 6 P.M., when a paper, entitled "Style in Architectural Draughtsmanship," will be read by Mr. Stanley D. Adshead.

THE WEEK.

THE six premiated designs for the Palace of Peace at The Hague, with forty other designs chosen by the Society of Architecture of Amsterdam, are about to be published. Messrs. T. C. & E. C. JACK will have charge of the edition for the United Kingdom and the British Colonies. The English architects whose designs will appear are MESSRS. JOHN BELCHER, A.R.A., J. COATES CARTER, J. F. GROLL, H. T. HARE, RUSSELL & COOPER, WILLS ANDERSON and H. W. COTMAN. The work will also be issued in other languages. In addition to the plates, the work will contain (1) A Short History of the Carnegie Foundation; (2) The Letter of Foundation; (3) The Conditions of the Competition; (4) The Report of the International Jury; (5) Short Notes on the Architects and their Work. The committee supervising the issue of the work consists of the following:—J. JURRIAN KOK, director of the Royal Factory of Porcelain and Earthenware, "Rozenburg," at The Hague; J. C. T. LOUIS RIEBER, certificated architect, secretary of the Society for the Advancement of Architecture at Amsterdam; and K. SLUITERMAN, professor at the Technical University of Delft.

THE announcement that the French Government intend to secularise the buildings employed by Roman Catholics for the purposes of religion can cause no surprise. It was anticipated from the beginning of the dispute between the secular and the ecclesiastical authorities. It will in some cases be necessary to effect costly alterations in order to adapt the buildings to their new uses. The immense seminary of Saint-Sulpice in Paris would appear to be suited for a barrack. But it cannot be transformed into a supplementary Luxembourg museum unless a very large sum is expended. It is to be feared that the authorities will be indifferent to degrading the buildings; perhaps that sort of revenge may be sought. English students of painting must be familiar with the exterior of the very large nunnery on the Boulevard de Clichy, at the corner of the Rue de Douai. The Government have not concluded the arrangements for the sale of the property. But meanwhile the chapel has been converted into a theatre for cinematograph exhibitions, and as gaiety is much sought in that part of Paris performances may be expected resembling those in some other establishments in Montmartre. In course of time secularisation may be followed by strange results, but at present these sudden transitions are not creditable to the French authorities.

It is proposed to introduce several important additions in the building by-laws of Manchester. The draft has been submitted to the Council. According to the *Manchester Guardian*, one of them provides for the covering of foundations with good cement concrete at least 6 inches thick and the asphaltting and cementing of the whole ground surfaces within the external walls of domestic buildings, and there are a number of amendments regulating the height, length and construction of walls. The cellars of new dwelling-houses are to be laid with a bed of cement concrete not less than 4 inches thick. The new provisions in regard to open spaces in front of and behind new buildings vary according as the building is in Manchester, Moss Side or Withington. They are followed by a provision with regard to open spaces generally, which provides that every person who shall erect a new dwelling-house shall provide open spaces about it which, including the site and one-half in width of the adjoining streets co-extensive with it, shall be of an aggregate area of not less than 200 superficial square yards. Where, however, the detailed by-laws are more exacting the above provision is not to be read in derogation of them.

Windows in habitable rooms are to be equal to one-tenth of the floor area, and there are provisions regulating the space which windows are to open, and securing that such aperture shall be at such a distance from the ceiling of the room as shall secure proper ventilation according to modern ideas. Staircases in domestic buildings are to have a tread of not less than 9 inches in width, with a rise of not more than 8 inches for each step, and are to be properly ventilated and lighted, and where a principal staircase is to be used by several families in common it is to be adequately ventilated upon every storey. In public buildings public staircases are to be not less than 4 feet in width and to have a suitable handrail on each side. The width of the staircase is to increase with the size of the building, and in the case of larger buildings there are provisions for landings at each flight and prohibition of winder steps. Under the heading of drainage it is provided that drains shall be laid in concrete.

THE Guildhall of Chichester in Priory Park was formerly a chapel of the Grey Friars, and is believed to date from the thirteenth century. Secular use has not been advantageous to the building, but its former appearance is suggested by the window and the portions of the sedilia which have survived. Fortunately for Chichester, Mr. E. S. PRIOR now lives near the city, and he has offered the City Council suggestions relating to the Guildhall as well as other buildings. He recommends structural repair to keep the building together, decorative repair to make it seemly, removal of excrescences within and without, with a few additions which are indispensable. Chichester, although a city, professes to be in a state of poverty, and payment for drainage is supposed to have monopolised all its resources. The finance committee of the City Council consider they have acted courageously in recommending a grant of 500*l.* to pay for the unavoidable reparation. But they have imposed the condition that the cost of the other works be obtained from outside sources which would not entail taxation. In other words, if the old building is to be retained, the county of Sussex will have to subscribe liberally.

It was to be expected that the United States would not long delay in trying the experiment of a Garden City. A company having been formed in New York a competition was announced for single and double houses. In response seventy-two designs were sent in for single houses and twenty-seven for double houses. The judges in their report say:—"Of the plans for the single houses, approximately two-thirds were of the same general type, viz. a central entrance and hall, with the large living-room at one side and the dining-room, kitchen, &c., at the other. In another somewhat numerous class, the long axis of the plan was at right angles to the direction of the street, thus presenting the narrower front toward the street. In view of the wide frontage of the lots, this type of plan is not considered desirable. In many other plans all the rooms were placed in a row fronting the street, and while this type is preferable to that last named, it is open to the objection that the distance between the houses (in block plan) is reduced to a minimum, and that the windows of the kitchen and other service portions face the street." The judges favoured the first-named type. It is stated that for double houses preference was given to plans in which the entrances to the houses were separated by a considerable distance, and in which the porches were not placed side by side; also, as in the case of the single houses, they have considered the question of exposure in relation to the prevailing breezes. In general, the drawings submitted for the double houses, while fewer in number, were more satisfactory in design. The first prize was awarded to Mr. J. LOVELL LITTLE, jun., of Boston; the second prize was obtained by Messrs. W. W. WETTON & G. B. PIKE, of New York. In addition several prizes were given.

THE WINTER EXHIBITION.

THERE are two paintings in the collection at Burlington House which the visitor who is disposed to seriously consider the exhibition would do well to begin with seeing. One is a *Group of Figures with Landscape Background* in the first room. If the purpose of painting is the decoration of walls this picture, which is executed in tempera on canvas, suggests the treatment which is not only the oldest but the most fitting. The quiet colours, the flatness and the broad, masterly handling enable the painting to assert itself amid its more brilliant neighbours. The second painting is in the next room, and is *A Picture Gallery*, by HÄECHT. It is an interior of which modern artists are likely to approve and to wish that most rooms resembled it in the abundance of pictures. It might be easily imagined that the walls were constructed of paintings framed together from floor to ceiling. Some of them can be recognised—especially those by RUBENS—and all are brilliantly coloured, red being dominant. In the foreground we see the INFANTA, who was Regent of the Netherlands when the picture was painted in 1628, her husband, the Archduke, and several artists. But against the background of paintings they appear to be of little account. The painters' work has become supreme, and not only architecture, but even the spectators, are sacrificed to that disregard of measure by which some modern rooms are made to resemble a picture-dealer's warehouse.

There is no question about the variety of this year's exhibition, for the paintings range from one by an unknown artist of the fourteenth century to some by JAMES CHARLES, who died a few months ago. But whether the paintings are by Italians, Flemings, Dutchmen, Spaniards or Englishmen, they were all produced without any thought of the principles of wall-decoration. The visitor, therefore, after passing through the rooms, who considers their decorative value, cannot help concluding that in one important sense they are all alike failures. Placed on easels or other stands the majority of them would no doubt be interesting. But as the artists were indifferent to the manner in which they were to be presented we must assume other standpoints. REYNOLDS, we believe, said that a room hung with pictures was a room hung with thoughts, and for the sake of the thoughts we must accept them as placed on walls, although they may not possess the qualities adapting them to that position.

The first painting in the catalogue is a *Virgin and Child*; it is an example of the Sienese school. The artist has endeavoured to express holiness and gravity on the countenance of the youthful VIRGIN, and on that account the picture compels respect unlike any others of the same class in the room. The delicate treatment of the gilding on the blue robe is by itself sufficient to reveal the painter's feelings. Not even the *Virgin and Child* by SANDRO BOTTICELLI, with its great golden columns and gold embroidery, nor the *Madonna dei Candelabri*, which for the occasion is assumed to be RAPHAEL'S, nor PERINO DEL VAGA'S version, although there is a suggestion of the Raphaellesque in the face, can compare with the simple work of the Sienese artist. If we wish to measure the degradation of Italian art, it is only necessary to compare No. 1 with No. 31. For ANDREA DEL SARTO'S *Holy Family* must have been painted after he had lapsed into dishonesty, for the figures are not only without dignity, but they are absolutely vulgar and ugly. There is a *Salvator Mundi*, ascribed to ALBERT DÜRER, which must have been executed under Italian influence. *The Angel of the Annunciation*, by FILIPPINO LIPPI, has the usual charm of the painter. *The Entombment*, by SEBASTIAN DEL PIOMBO, suggests at least the influence, if not the hand, of MICHEL ANGELO, especially in the muscular CHRIST and the fainting VIRGIN. *The St. Catherine*, by LUINI, recalls DA VINCI, besides having merits of its own. *The Circumcision*, by BARTOLOMEO VENEZIANO, is a vigorous work. The robes are so richly painted it becomes a costume piece, but as all the

figures appear to be familiar with similar operations the ceremony is without religious importance. A portrait of *Mary Queen of Scots* will probably compel people to wonder once more why so plain a woman was so fascinating. SIR ANTONIO MORE'S portrait of himself might have served as a trade specimen, for with his great gold chain, sword, dark dress and haughty expression he could easily be taken for a governor at least. There are several paintings of boys in the exhibition, and they might with advantage have been placed together. The oldest example among them, and in some respects the most curious, is that of the *Dauphin Charles Orlandt*, a small work dated 1494. *A Portrait of a Lady*, by NICHOLAS LUCIDEL, has as much elaborateness in the treatment of the dress and accessories as if it were ascribed to HOLBEIN; it is more characteristic of him than the small portrait of a lady which is supposed to be one of HOLBEIN'S genuine works. There is a mysterious *Lady of the Court of Lodovico il Moro*, by AMBROGIO DE PREDIS, and the portrait of *William Cecil, first Lord Burghley*, suggests the minister who could keep State secrets well, but we cannot imagine that a man with such a crabbed face was fond of joking. *The Toilet of Venus*, by GIOVANNI BELLINI, is a three-quarter nude figure holding a mirror, yet, handsome as is the woman, it is not the goddess of the Greeks or of modern artists. She seems as anxious as if trying the effect of a new hair dye.

The thirty-eight pictures in the second room have been well selected. The portrait of himself by FRANK HALS continues to be as brilliant as ever, and from his florid face it might be assumed that he was about to take a turn in the Haarlem Park after a good dinner. His *Admiral de Ruyter* may not be completely finished throughout, but it recalls the great sailor who took a victory as quietly as an ordinary voyage. There is another vigorous portrait of a Dutch officer by VAN DER HELST. Teachers who arrange material for still-life paintings would do well to study the small picture by HEDA, where goblets, salvers and other appurtenances of dessert have the appearance of having been brought together fortuitously. REMBRANDT'S portrait of his father represents him not as an everyday miller, but as if he were some dignitary wearing a black robe and a gold chain. The old lady who is the subject of No. 56 looks resigned, although time has not dealt lightly with her. *Rembrandt's Cook* shows a coarse-featured girl holding a knife, but the way in which the head is placed, as if she were looking down, is novel for the artist. The portrait of *A Boy* was formerly accepted as WILLIAM OF ORANGE, and suggests that the great artist could, when the occasion offered, appreciate youth as well as old age. In VAN DER HEYDEN'S *View of Amsterdam* the Nieuwekerk is the principal object, and the detail is represented with more than photographic fidelity. *The Breezy Day*, by JAN PORCELLIS, suggests that, however capable he might be to represent a canal, he could not portray sea waves, for those seen are conventional and wooden. Compared with it VAN DE VELDE'S *Calm with Boats*, where the sea is motionless, becomes a masterpiece. Another fine picture of a building is the *Cathedral* by VAN DER VLIET. As usual, the masonry is very white and the visitors wear their hats. But a little variety is introduced, for the sexton stands in an open vault and he is talking with the minister. *Grace before Meat*, by JAN STEEN, is not altogether a pleasing picture, for we see a skull and a motto "Think on Death," and the woman who holds the child must be a sluttish housewife, for the materials for the repast are thrown together without any order. The ham is further evidence, for the painter suggests that it has been hacked rather than carved. It is to be hoped poor STEEN was not suggesting the character of his own home.

The large gallery presents examples of several schools. In one of CANALETTO'S views of Santa Maria della Salute we have larger figures than he usually painted. *General Honywood* is one of the largest por-

traits which has appeared in the same position, for it must occupy about 120 square feet. Considering the difficulties of dealing with so portentous a warrior and his charger, it is creditable to GAINSBOROUGH that he succeeded so well. REYNOLDS's portrait of *James Beattie, D.C.L.*, should be kept in concealment, for it is evidence alike of the vanity of fame and the uselessness of controversy. In 1770 BEATTIE, who, according to Dr. JOHNSON, was a combination of the poet, the philosopher and the good man, published an essay on Truth, which was supposed to have established orthodoxy on a rock where it was to be unshaken for ever. REYNOLDS for once lost his good sense, and having to paint a portrait of the author he turned him into a figure in an allegorical picture, in which BEATTIE stands in his red gown on one side while the Angel of Truth is pushing down VOLTAIRE, and, it is believed, GIBBON and HUME, to perdition. If the painter wished to rival the famous picture which Dr. PRIMROSE commissioned, in which he appeared in a gown and band presenting his book on the Whistonian controversy to his wife posing as VENUS, he could not be more absurd. But we may pardon the freak for the sake of the little boy next the picture, with a firmly-closed mouth, as if he had just resolved not to spend a penny on cakes, and who was destined to become Viscount ALTHORP and Chancellor of the Exchequer. GAINSBOROUGH is again a power in this gallery. There is a half-length portrait of the Hon. Mrs. GRAHAM, who died in her eighteenth year, but which is not quite as fascinating as the full-length portrait of the lady in Edinburgh. That beautiful work is, however, recalled by a portrait of the Hon. ANNE DUNCOMBE, which might serve as a pendant to it. But not even the *Mrs. Graham* surpasses the head of *Miss Linley*, and indeed it is to be doubted whether GAINSBOROUGH ever portrayed a finer portrait. There is a portrait by REYNOLDS of the same lady (*Mrs. Sheridan*) on the opposite wall, which records the effect of domestic trouble. Curiously, both are clad in a white and gold dress. Another masterpiece of GAINSBOROUGH is his *William Pitt*, in which a complex character is expressed with such unusual success as to place GAINSBOROUGH on a level with the Venetian portraitists. One would hope that the portrait of *Mrs. Romney* is genuine, for it could be taken as a peace-offering by her unfaithful husband. There are signs of care, but not sufficient to overcome her beauty. It must be allowed that this year each of the three English portraitists have triumphed over VELASQUEZ. There is only a single work by the Spaniard in the exhibition, a portrait of *Mariana, Second Wife of Philip IV. of Spain*, and who acted for a time as regent of that country. It would be difficult to discover a more disagreeable countenance, and VELASQUEZ could not do justice to it and to his reputation at the same time. There is a portrait of *A Knight of Santiago* by his master, FRANCISCO PACHECO, and if all his works were of equal merit he was well qualified for the office. By TURNER is a fine composition, *Mercury and Herse*, and also his *Burning of the Houses of Parliament, October 16, 1834*, which afforded him ample opportunity for the display of his favourite yellow. The view is taken from the Surrey side, and the piers of the bridge, with the two towers of Westminster Abbey, form substantial contrasts to the flames. Unlike most painters of similar scenes, TURNER was sparing in the use of red.

Portraits prevail in the fourth gallery. There is no better portrait of the Duke of CLARENCE, afterwards WILLIAM IV., than HOPPNER'S. COPLEY'S *Family Group* is an animated scene, for he has realised the absurdity of supposing that four children would pose in quiet attitudes, and therefore he divides them, allowing only two to be at rest. WILKIE'S *Chelsea Pensioners Reading the Waterloo Despatch*, which was painted for the Duke of WELLINGTON, is a collection of portraits of soldiers. The painting is so well-known from the engraving it needs no description; but it is satisfactory to find that after eighty-four years the picture is in

excellent condition, unlike some others of the artist's works. TURNER'S *Devil's Bridge, St. Gothard*, is a stern scene which permitted no exercise of his imagination, and when painted the "Brown Devil" must have had possession of him. MORLAND'S *Postboy's Return* is marked by his usual facility, and although we see we have only an interior of a stable, scope was found for agreeable colouring. "O Scottish chiefs, didn't we weep over you!" exclaimed THACKERAY, and many another schoolboy would have to plead guilty to the tender impeachment. Would they have done so if a reproduction of OPIE'S portrait of JANE PORTER was used as a frontispiece? She seems to be a plain unpretentious little woman, but the so-called brown hat surmounting her head would make JUNO herself ridiculous.

We come nearer our own time in the fifth gallery. JOHN LINNELL was not only the author of *The Barley Field*, a thoroughly Surrey scene, but of the nearest approach to a portrait of TURNER which was allowed to be executed. Lord LEIGHTON'S *Syracusan Bride Leading Wild Animals for Sacrifice to the Temple of Diana*, which was painted in 1866, was no doubt intended to serve instead of a frieze; the figures of the women are statuesque, and the half figures of men seen in the foreground suggest that the procession was along a marble platform. A later work, *Gathering Citrons: A Court in Damascus*, is delightful through the figures and the architecture. *A Chalk Pit, Landscape, The Pond and The Hayfield* are evidence of the skill of the late JAMES CHARLES in landscape, while the old woman contemplating the wedding dress she wore sixty years before proves him to be as a painter of genre equal to any of his contemporaries. *The Harem*, by J. F. LEWIS, is a marvel of detail. *Fairlop Fair*, by C. R. LESLIE, shows a number of single figures scattered round the famous oak tree, but it becomes a curiosity from the indifference to composition. No finer view of Edinburgh can be found than SAM BOUGH'S, which is taken from the canal bank and shows the castle on one side. R. P. BOWINGTON'S *Street Scene in Verona* is a splendid view of one of the narrow streets in the old city, and animation is imparted to it by the two processions passing along.

In the water-colour room will be seen twenty portraits of early members of the Academy by GEORGE DANCE, R.A., the architect of Newgate; they form a most interesting series. Among them are the architects T. SANBY, CHAMBERS and JAMES WYATT. There are also several water-colours, including the designs made by TURNER for CAMPBELL'S poems. Finally, there are several chalk studies by Lord LEIGHTON.

CARLISLE CATHEDRAL.

(See Illustration.)

THE German Chancellor in his last manifesto declared that progress was only to be obtained through blood and tears. If the words were to be taken as expressing the law of the world, the people of Carlisle district should long ago have reached a state of perfection. No part of England could be compared with it as a theatre of war. From its position it was open to attacks from all sides. Caledonian tribes, Danes, Saxons, armies from the south during many centuries appear to have made Carlisle the point of attack. Alternately it was the frontier post of England and of Scotland. In such a district there was a necessity for institutions which would receive men who had no ambition for a militant life. Hence it was, no doubt, that at a very early date the north of England was remarkable for its monastic experiments. Indeed, DAVID I. of Scotland planted the abbeys of Melrose, Kelso, Dryburgh and Jedburgh in a corresponding part of his kingdom. If such establishments were respected by combatants, the arts of peace would have had a chance for growth. The spirit which animated the leaders did not, however, allow of any exceptions. The English monks are known to have appealed to the

Roman legate in the thirteenth century for efforts to be made which would enable them to escape from the compulsion by which they had to fight like ordinary men. Apparently no relief was then found for them; and, indeed, it is difficult to see how in such a debateable land there could be any escape from what would now be called the policy of blood and tears.

The history of the cathedral of Carlisle is in keeping with that of a disturbed country. Originally the northern part of England formed the diocese of Durham. WILLIAM RUFUS gave that great bishopric to his chaplain, RANULF, whose nickname, "The Burning Torch," is enough to suggest that he was not renowned for his modesty or piety. He was disliked by HENRY I., against whom he plotted, and the king took advantage of the bishop's flight to Normandy to conspire with Earl ROBERT to divide his diocese. When HENRY was afflicted by the drowning of his children, ADELULF, who was the prior of an Augustinian house in Carlisle, was able to persuade the king to complete the arrangements and to appoint him the first bishop. By so doing there was a breach of custom, for Augustinian monks were not then selected to fill the episcopal office. The history of the see therefore begins in 1133.

VITET says that the Normans brought ready-made cathedrals to England, just as LENÔTRE transplanted full-grown trees to adorn the swamps of Marly. The meaning of the words is that all the arrangements for building were carried out in France. The late Dr. FREEMAN said it was manifest that what was erected in Carlisle was no more than a moderate-sized Norman church, and, as was customary among the Augustinian canons, the nave was used as the parish church and the chancel was limited in area. It is doubtful whether Carlisle could at first be considered a see in the ordinary sense of the word, for there is no record of an episcopal palace or residence. Norman bishops were generally men who were not out of place in councils of war or on the battlefield, and they seem to have possessed several residences. But in Carlisle the episcopal office was held by the prior of the monastery. A part of the nave and the south transept are supposed to be relics of the early cathedral, and the massive piers which remain suggest that defence as well as stability was in the mind of the designer. The church was hardly commenced when Carlisle was seized by King DAVID I. of Scotland. After holding it for a few years he was defeated, but again he obtained possession of the city. The contest for it continued for nearly a century until 1237, when it was ceded to HENRY III. It is now impossible to say whether the choir was enlarged before or after that event, but a different style to that of the early Normans was in favour. Tradition assigns alterations to Bishop HUGH, who presided over the see from 1218 to 1223, and it is likely that a part at least of the work in the choir was undertaken by him.

There was a fire in 1292, and in consequence it was necessary to rebuild the choir. But it is evident that the undertaking was not completed until the fourteenth century. For the glorious east window with its intricate tracery could not have been carried out at an earlier date. Indeed, part of the stonework of the window remained incomplete for a much longer period. In 1370 Bishop APPLEBY made a great effort to complete the choir, and he succeeded in obtaining money and materials from EDWARD III., the great families of Cumberland and the city of Carlisle. The arms of the benefactors were painted on the ceiling of the chancel, but they have now vanished. As the figure of an Augustinian canon appears in the window, we must suppose that the connection between the cathedral and the priory continued at the end of the fourteenth century. In fact, it lasted until 1541. Prior GONDIBOR is credited with the parts of the cathedral on which his initials appear. Prior HAYTHWAITE had the door on the south side of the choir constructed. The opposite door and the repairs of the tower in 1507 are credited to Prior SENHOUSE.

The choir is unique in England, from having representations of the months as part of the ornamentation of the capitals. They appear in connection with foliage. January shows a figure with three faces, drinking from a cup. February is suggested by a man seated on a low stool before a fire, and who is draining the water from one of his boots. March has a man digging at the foot of a tree. For April we have a man cutting a branch from a tree. May is represented by a woman presenting a bunch of foliage to a man. June is indicated by an equestrian holding a hawk on one hand and a branch of roses in the other. July is symbolised by a man mowing. For August we see a man standing in a field of corn clearing it from thistles. September is denoted by a man in a field of wheat holding a sickle in his left hand. A man with a bunch of grapes in his left hand and a hooked knife in his right stands for October. November appears as a man sowing corn, and December by a man about to kill an ox with an axe. The capitals suggest the importance of agricultural operations in the fourteenth century, and it might be concluded that no other kind of industry then existed. But it is satisfactory to find that peaceful pursuits were in favour, for at an earlier time the sculptors would have endeavoured to glorify warriors. Evidently the days for military bishops had passed away.

There was another fire in 1392, and it became necessary to rebuild the greater part of the north transept. Early in the fifteenth century the height of the tower was increased, but it cannot be said the addition was excessive. It is supposed that a wooden spire was at the same time placed upon it. The beautiful seats in the choir with their elaborate canopies are credited to Bishop STRICKLAND, who ruled from 1400 to 1419.

The priory of Carlisle was among the religious establishments which came to an end under the orders of HENRY VIII. The cathedral in consequence could not fail to suffer, although it was provided with a Dean and Chapter. The financial arrangements were likely to have been in the hands of the Augustinians, and when they were removed it was probable that a defective administration existed for some time. The regular revenue of the see was very limited. Bishop ALDRIDGE contrived to hold his office in that most difficult time, under MARY as well as HENRY. But as a great lover of literature he was more likely to think of books than of his cathedral. We do not learn of any works which were carried out during succeeding years, and it is possible that when DAVID LESLEY destroyed a large part of the cathedral it was not in a condition which compelled reverence. In 1634 it was described as being "like a great wild country church, and as it appeared outwardly so it was inwardly, neither beautified nor adorned one whit." Twelve years afterwards LESLEY and his army were besieging the royalist city.

To them a cathedral was possessed of no special importance. It was a church and no more. In the Ages of Faith ecclesiastical buildings of all kinds had to succumb to the necessities of defence or attack, and LESLEY could find many precedents to justify his action. He had to erect protective works, and in the cathedral he found a quarry of prepared stones. Instead of condemning him he deserves to be praised. He might have destroyed the east end of the building rather than the west, and posterity would have lost the beautiful choir. LESLEY may have thought that the removal of 92 feet of the nave would leave sufficient area for the congregation. He could not have accepted the theory that so large a choir was to be occupied exclusively by a few clergymen. What is remarkable is that since 1645 no effort has been made to restore the nave to its original length.

In 1745 Carlisle repeated its old history in connection with the invasion of CHARLES STUART. The Mayor and Corporation proclaimed him King of England, and in a short time they had to pay dearly for their enthu-

siasm. On that occasion the cathedral does not appear to have suffered at the hands of the Scottish or English troops. A few years afterwards it was recognised that the cathedral was "neither beautified nor adorned," and an attempt was made to enhance its appearance by covering the choir with sham vaulting. Some eighty years afterwards it was removed under the direction of Mr. EWAN CHRISTIAN, and the barrel-roof was revealed. Mr. CHRISTIAN carried out other alterations which have not been approved. Then the work was placed in the stronger hands of Mr. G. E. STREET. But it is needless to say his work has also suffered condemnation from severe critics. Dr. FREEMAN led the way in regretting that so much was done for the sake of uniformity and consistency with an ideal which was more or less imaginary. In spite, however, of all its vicissitudes, in Carlisle Cathedral much has survived which must be delightful to the student of English Gothic art.

ROYAL SCOTTISH ACADEMY.

THE following evidence concerning the origin of the Royal Scottish Academy was given by the president, Sir James Guthrie, before the committee of inquiry into the Royal Hibernian Academy, &c. :—

By the fifteenth article of the Treaty of Union with Scotland, in 1707, a large sum of money was made payable to the Scots. It was about 398,000*l.*, and was to recoup Scotland for the additional liabilities it incurred owing to the Union, mainly in the way of taxation. It came under the English excise duties and the English taxation, and a sum was provided to recoup it for that extra expenditure, which sum was afterwards to be met out of the revenue of the Scottish contribution to the taxation. The same article provided that 2,000*l.* a year of that sum should be made available for the encouragement of manufactures and fisheries in Scotland, and in 1727 a body was appointed of twenty-one commissioners, called the Trustees for the Improvement of Fisheries and Manufactures in Scotland. That was, of course, an important State body. It had under its charge the manufactures of Scotland, which were at that time expected to increase, and which did increase owing to the provisions of the Union. The functions of that body began to take care of themselves. Manufactures progressed, fisheries developed, and so on. There was no particular change made in the body itself, but as time went on, it more and more assumed the character of a State body which had almost no functions to perform. In 1828, about a century after it was founded, it was empowered to spend this money on whatever it thought advantageous for Scotland and the United Kingdom, and in 1847 its money was made available for art purposes. In fact, there was almost a direction given that it should be used for art purposes, for instruction in the fine arts, in arts as applied to manufactures in the first instance, and so on. That was the position of the 2,000*l.* a year, which came from what is called the Scottish Equivalent Money, and I should like you to note very carefully that this 2,000*l.* a year was national money, that it was money for which a consideration was given at the time of the Union, that it was absolutely the property of Scotland, and that the payment of it every year was simply the carrying out of a financial obligation incurred in the Treaty of Union.

In London there had been a body called the British Institution, and in the early part of the nineteenth century a number of gentlemen interested in art thought it would be a good thing to have a similar body in Scotland. Accordingly, in 1819, a body called the Royal Institution was founded in Edinburgh. It had a large membership and the Council was mostly composed of members of the Board of Manufactures. I ought, perhaps, to say here that the roll of the Board of Manufactures in Scotland contains the names of many distinguished Scotsmen, in every way representative of the country. So, whatever there is to complain of—and there is a good deal to complain of—in the administration of the Board of Manufactures, nothing can be said against the personnel of the members. This institution for the promotion of the fine arts was fathered by the Board of Manufactures. It was arranged that a building should be put up, for the cost of which the Board of Manufactures would supply the funds, and the Royal

Institution was to pay a rent for the occupation of that building. This arrangement was carried out. It was originally the Scottish Institution for the Encouragement of the Fine Arts. Between the years 1821 and 1826 the building was erected. It is the building next Princes Street, on the Mound, Edinburgh, and consists of several galleries for the exhibition of works of art on the ground floor, and of upper rooms, which were to be used for the Trustee School—the school that had been carried on by the Board of Manufactures since about 1760. The Royal Institution, like the Board of Manufactures, was composed of noblemen and gentlemen, and they had associated with them what was called the Associated Artists. The two were kept entirely distinct.

These Associated Artists helped the directors of the Institution in providing exhibitions, but they were not admitted to any share in the government of the place. It was, however, arranged that the profits of the exhibitions should go to a fund for the widows and orphans of artists, and that arrangement became a bone of contention afterwards in the carrying out, but it was carried out. The Associated Artists began to smart under what they considered unfair treatment. I do not know the details, and they would not be profitable. But twenty-four artists, including most of them, in the year 1826 agreed to start an institution of their own, to be called the Scottish Academy. At the last moment, in view of the great influences arrayed against them, nine of the twenty-four lost heart and retired. That left fifteen men, without money or social influence, and these men founded the Scottish Academy.

They began by having an exhibition in Waterloo Place, Edinburgh, which was a rival to the one carried on by the Royal Institution. Those of their colleagues who did not join them continued to support the Royal Institution. The first year the Academy's exhibition was by no means as good as the exhibition of the Institution; the second year it was as good, and the third year it was much better. To make a long story short, it drove the Institution exhibition out of the field in the course of a few years. Thereafter, the Institution agreed that the Academy exhibition should take the place of its own in the Institution galleries, and the Academy continued to hold its exhibitions there for a long time. Meanwhile the members of the Academy, having made a little money by their exhibitions, with remarkable public spirit spent the money on the purchase of works of art, and their collection grew. The Royal Institution also acquired a collection, partly by bequest and partly by purchase. These had to be housed. They were housed in the galleries of the Institution. These galleries were limited, and friction began between the exhibition of modern pictures every year and the housing of the other pictures in the galleries. There was a great deal of unpleasant bickering between the Institution people and the Academy representatives on this question, and the position finally became intolerable—so intolerable that Government was approached directly, and sent down Mr. Shaw Lefevre in 1847 to inquire into this whole question—the question of the housing of the old pictures in Edinburgh, the question of the administration by the Board of Manufactures and Royal Institution, and the question of the development of the Royal Scottish Academy. Mr. Shaw Lefevre made a report, in which he said provision ought to be made for the Scottish Academy, and a building should be erected for the purpose of an annual exhibition of the works of living artists.

The question was taken up by the Government, and a Bill was promoted to provide a building which should house the Royal Scottish Academy and the valuable collection of pictures belonging to the Royal Scottish Academy and the Royal Institution, and on loan to the Royal Institution, as the nucleus of the National Gallery. The Bill went up to the House of Commons, and at its first stage was lost. There was agitation in Edinburgh over this, mainly because the Town Council of Edinburgh had played a very generous part in the matter. The Town Council of Edinburgh, interested in the works of the living artists and in the annual exhibition of pictures, had agreed to give a site worth 40,000*l.* for the nominal sum of 1,000*l.*, out of consideration, in the first place, for the Royal Scottish Academy. That was the reason that actuated the Town Council in making this proposal, which was accepted; and the throwing out of the Bill was therefore felt by the Town Council to be an unfortunate miscarriage that would injuriously affect the public interest in Edinburgh. The Lord Provost of the time went up to London and told influential members of the House what the result of the throwing out of the Bill would

be. Two members had been chiefly instrumental in securing that result—Mr. Bright and Mr. Hume. Mr. Hume, on being told the real position of affairs, asked, "Why was I not told this before? I shall now support the Bill." Mr. Bright took a similar view, and the Bill subsequently passed. That Bill was the instrument under which the whole of the present state of affairs came into existence.

But it was found that, for some reason or another, the name of the Royal Scottish Academy was not mentioned in the Bill. In spite of all that I have told you, in spite of the fact that, but for the Scottish Academy, there could have been no Scottish National Gallery (since one-third of the pictures, and the most valuable portion of them, belonged to the Academy); in spite of the fact that, but for the Academy, there would have been no joint building (as the Town Council would not have granted the site had the Academy been excluded), the name of the Academy was not mentioned in the Bill. They asked why this was so, showing signs of opposition, and were told by their friends in London that the Royal Academy of London was not at that time in good odour, and that the Bill would have a better chance of going through if the name of the Scottish Academy was not mentioned. They accepted this explanation on the understanding that an appropriation of the building was to be made, and that in it the Academy would be fairly treated. The building was proceeded with. It took the form of a twin building, exactly like the opposite pages of an open book, with galleries here and there. The eastern half is occupied for four months of the year by the Royal Scottish Academy, and the western half is in the occupation of the National Gallery of Scotland. That building was erected, but when the appropriation was made out the same feature was observed—the Academy was not properly recognised. Its name was mentioned, certainly, but its tenure did not commend itself to the members. The Town Council was again approached in the matter, and the Lord Provost wrote a very strong letter on the subject, showing the whole grounds that had influenced the Town Council, showing why they had given this site, and complaining not only that he had been misled, but that he would be made the means of misleading others, if this matter was not put right.

The result of all that was that Mr. Wilson, who occupied some position in the Treasury—I think that of Secretary—was sent down to Edinburgh to go over the whole ground again and make another and final appropriation of the buildings. The Treasury minute he wrote was adopted in 1858. It is a statement of the conditions under which we live to-day. It took the place of the Minute of 1855, which was most unfair to the Academy. According to this final Minute the eastern part of the building was to be called the Royal Scottish Academy. The Royal Scottish Academy was to have during four months of the year the right of occupation of this set of galleries. It was also to have a small council-room and a library at the end of the building in perpetuity. The other half was to be called, and was to be, the National Gallery for Scotland, and was to house the national collection. The whole building was to be absolutely under the control of the Board of Manufactures, and the Scottish Academy therefore had no say. They had no voice in any arrangements that might be made with regard to the disposal of the premises, other than was implied in the right to have the gallery for four months every year for the purposes of the exhibition, and the occupation of the council-room and the library, in perpetuity. That is the position to-day. The whole of the building has been under the custody of the Board of Manufactures since it was erected fifty years ago, and the Scottish Academy has consequently had to apply for every trifle that is required. Theoretically, if we want to drive a nail into a wall we have to ask permission from the Board of Manufactures. As a matter of fact, if we want to decorate a room, we have to ask permission of the Board of Manufactures. The whole position is an unfortunate one, involving immense sacrifices of time and labour, and giving rise to undesirable differences of opinion, which have been of the greatest prejudice to art all along. In my view, the brigading of a body such as the Royal Academy with a body such as the Board of Manufactures was an initial mistake. It is bad administration. The Board of Manufactures was an authoritative State body. The members of it were men accustomed to authority. They were patrons. The artists were men smarting under a sense of injustice, who, after a long struggle, had succeeded in freeing themselves from what they considered an intolerable control. Those two bodies were not likely to agree when one was

housed by the other. I do not say that all the fault was on one side. I think it likely that the artists may have been too ready to scent injustice and oppression. But there is no doubt that the others were arbitrary, and the result was unfortunate. That is the state of affairs which we are trying to do away with now.

TESSERÆ.

Early Churches.

EARLY Christian architecture, as might be expected, bore the evidences of its obligation to Pagan models, and neither the form nor the architecture of the first churches was the invention of the Christians. It was thought sufficient that the church did not imitate the heathen temple, and the conversion of a court of law into a place of worship was not calculated to shock religious prejudices. In this respect the Italian Christians were more scrupulous than those of Egypt and some other countries, who allowed a Pagan temple to be converted at once into a church; the saints succeeding, on the stucco newly spread over the walls, to the gods in the ancient sculptures concealed beneath it. The Gothic architects improved on the basilica. Our large cruciform churches as buildings are beautiful, but it may be questioned whether their plan is as well suited for the object for which they are intended as some others that might be adopted, and the form of a cross is certainly one of the worst for accommodating a large concourse of people, for enabling them to hear the voice of the preacher, or for permitting a large congregation to join in the services of the Church. The debasement of architecture was gradual, and was only the natural consequence of what had already commenced under the Roman empire, the various styles which grew out of it being merely changes in the earlier ones in different provinces of the Roman empire. They were all modifications of the late Roman, one varying it in this, another in that part, according to the taste and saints in each country, and the architecture in Rome itself underwent less alteration than in many of the provinces. For it is an error to suppose that the influx of northern invaders introduced the changes in the Roman architecture; they only borrowed and modified what they took, but did not originate any of their own. They brought with them no architecture, and the grandest palace of Attila was of wooden planks and beams. But without the necessity of this proof that the alteration in the style was of native growth, it is sufficient to examine the changes that took place in Roman buildings of various ages, even before the time of Diocletian and Constantine. The vertical line, which dates as early as the first century A.D., was really Roman, and the long and short work of our Saxon churches was the common style of building in villages of North Africa during (and probably long before) the reigns of Justin II. and Justinian. The invasions of the Roman empire hastened, but they were not the origin, of the decline of art.

Archæological Studies.

If we could look into the future the past would probably lose much of its importance in our eyes, and our curiosity would be much more strongly excited to ascertain the state of the world a thousand years hence than its state a thousand years ago. But this power is denied us; and to form an estimate of the character and capabilities of mankind more comprehensive than the experience of a single generation can afford we must apply to the retrospect of the past. Not that this curiosity influences none but those who might wish or be expected to draw profit from its gratification; on the contrary, it seems a temper natural in greater or less degree to all alike, reflecting or unreflecting. It is that which causes us to look with pleasure on an antiquated town, to grope among ruins, even where there is evidently nothing to repay us for the dirt and trouble of the search, and generally to invest everything entirely out of date with a value which its original possessors would be much puzzled to understand. But time works constantly as well as slowly, and therefore however antiquated the appearance, and however old-fashioned and changeless the habits of any place or people may seem to be, they are sure to present a very imperfect type of what they were even a single century ago. Who has not wished in various parts of England that we could recall for a moment the ancient aspect of the country; reclothe the downs of Wiltshire with their native sward, and see them studded with tumuli and Druid temples, free and boundless as they extended a thousand

years ago before the devastations of the plough and Inclosure Acts ; recall the leafy honours of Nottinghamshire and Yorkshire, and repeople the neighbourhood of Sheffield and the Don with oaks instead of steam-engine and manufactory chimneys ; or renew the decayed splendour of those monasteries whose ruins still strike the beholder with admiration ? If the romantic fictions of the Middle Ages could be realised, which tell of mirrors framed with magic art to represent what had formerly passed or was passing in distant parts of the earth, the happy discoverer might soon make his fortune in this age of exhibitions. What exhibition could be found more interesting than a camera-obscura which should reflect

past incidents of historical or private interest, and recall with the vividness and minuteness of life at least the external characteristics of long past ages ? Such fancies are but idle speculations. The past can only be recalled by the imagination working upon such details as the pen or the pencil of contemporaries may have preserved. Deserted places are usually too much dilapidated to convey more than a very imperfect idea of the minutiae of their arrangement or of the manners of their former occupiers ; places which have been preserved by being inhabited are of necessity changed more or less to suit the changing manners of those who tenant them.

HEARTS OF OAK BENEFIT SOCIETY, EUSTON ROAD.—DOORWAY.

NOTES AND COMMENTS.

THE death is announced of Professor OTTO BERENDORF, who was the leading archæologist of Austria; he was director of the Archæological Institute at Vienna and professor of archæology at the University. He held the latter office for thirty years. Previously he filled a similar position in Zürich and Prague. His principal work relates to the excavations in Samothrace, which were carried out at the expense of the Austrian Government. He also entered into the discussion relating to the Nikè, by PÆONIOS, which is in the Louvre, and which at first suggests a figure intended for the bow of a man-of-war. It is suggestive of movement, and is supposed to be a copy of the figures for the Acroteria of the Temple of Zeus at Olympia.

THE subject given this year by the Royal Sanitary Institute for the essay in competition for the Henry Saxon Snell prize was "Suggestions for Improvements in Sanitary Appliances for Use in Workmen's Dwellings and Labourers' Cottages, under the varying conditions of Water Supply and Drainage usually obtaining in Towns and Villages." Nine essays were sent in and have been brought under the consideration of the Council. Acting upon the advice of the adjudicators appointed by them the Council have decided to divide the prize between two essayists, whose essays are about equal in merit, and they have awarded to Mr. JOHN R. PRESTON, M.R.San.L., Lancaster, writing under the motto of "John of Gaunt," and to Mr. E. H. PARKINSON, architect and surveyor, Bradford, writing under the motto of "Spero Meliora," each the sum of 25*l.* and a bronze medal of the Institute.

ALL SAINTS CHURCH, Maidstone, is a remarkable example of a parish church converted into a collegiate church and again into a parish church. The stalls are evidence of the first change, which dates from the end of the fourteenth century. The building was lately examined by Mr. FRANK PEARSON, and his report should at once be acted on. According to Mr. PEARSON, there is a general decay going on over the surface of the Kentish rag stone, and there are signs that the disintegration is taking place more rapidly now than formerly. The projecting features and those most exposed to the weather, such as label mouldings, strings, copings, buttresses and weatherings, have suffered most. The clerestories of the nave and chancel, which were restored some twenty years ago, are in good condition, but the aisle parapets, especially on the south side, show considerable signs of decay. This is true also of the buttress tops. The label and arch mouldings of the west door are in a bad state, and in places the strings and base mouldings round the building have almost entirely disappeared. Several of the jambs of the windows, which are in Bath stone, have also suffered. Some stones at the bases of the east and west angle buttresses on the north side are coming away from the body of the work, and should be replaced. It is in the tower perhaps that the decay both of the dressed stone and ashlar is most extensive. On the west side it is difficult to find a stone that has not perished in a greater or a less degree. The belfry windows in particular are in a serious state, what is left of some of the stones being only retained in place by the bar at the springing. The parapets, especially that of staircase turret, require attention and some stones renewed. The strings and base mouldings here are in quite as bad a condition as those in the rest of the church, and the mouldings of the label and outer order of the arch into tower are almost obliterated. Mr. PEARSON suggests that the surface of the decayed stone should be treated with one of the preservative solutions.

THE Pavillon de Flore in Paris, which was designed by DU CERCEAU, has much architectural interest as a relic of the Tuileries. For several years it has been

used by the French Minister of the Colonies. The building is connected with the Louvre, and it has been recognised how certain was the danger of a fire in offices containing numberless documents, and the irreparable loss which would arise if the fire extended to the adjoining galleries of the Louvre. Various suggestions have been offered about offices for the Minister. It is now stated that M. REDON, the architect having charge of the Louvre, has been ordered by the Government to adapt a house in the Rue Oudinot, lately occupied by a community of monks and their patients, for public offices for the Colonial Minister. The authorities of the Louvre are anxious for the removal, not only for the safety of the collections, but also in order to obtain the space required for the exhibition of works of art which are now kept in seclusion.

ENGLISH contractors who may be desirous to extend their business will be wise if they hesitate before taking any steps to tender for works in connection with the Dublin Corporation. We lately published reports which manifested the peculiar system of preparing plans and specifications by which contractors possessing the wide experience of Messrs. PEARSON were led astray and were involved in costly lawsuits. On Monday last there was another instance. The acceptance was moved of the tender of a Dublin firm amounting to 47,593*l.* 15*s.* 11*d.* for the construction of sewers and other works in connection with the main drainage of Clontarf, one of the suburbs. A London firm, however, had offered to do the work for 1,251*l.* 8*s.* 2*d.* less, and moreover were willing to employ only Irish labour. Honesty, fair play and regard for the interests of the ratepayers dictated that the work should be given to the London firm. But for some unexplained reason the majority of the Corporation were in favour of paying the larger amount. No doubt the members understand the wishes of the constituency in preventing economy, but we humbly suggest that whenever they solicit tenders in England they should announce the impossibility of accepting any of them, although based on minimum prices for labour and materials.

THERE was a time when Parisians would have suffered much inconvenience before they would have allowed any obstacle to be created which would diminish the interest of the Invalides for a month. But we are afraid that one effect of the *entente cordiale*, about which we hear so much, is that Frenchmen now take a British view of everything connected with aesthetics. Paris, like London, is to have its underground railway, part of which is in operation. Another section is about to be commenced, and the contractor has found no difficulty in obtaining authority for using the esplanade in front of MANSARD's beautiful building as a site for his stores and workshops. We know by experience in England the kind of structures which are run up by railway contractors, and we can therefore easily imagine the startling contrast about to be seen. It will also be inevitable that the Invalides will be invisible from several points of view for at least three years.

MANCHESTER ROYAL INFIRMARY.

BLOCK PLAN

THE LIVERPOOL CELEBRATION.

ON August 28, 1207, King John granted letters patent by which Liverpool was constituted a free borough. It is proposed to celebrate the anniversary this year, and the town clerk has prepared the following report on the subject:—

The town clerk begs to report that on August 10 last he mentioned to the committee a conversation which he had had with Professor Ramsay Muir with regard to the proposed celebration of the 700th anniversary of the foundation of Liverpool.

Liverpool was founded by King John, who, on August 28, 1207, made Liverpool a free borough by granting to the burgage tenants in Liverpool liberties and free customs.

If it is decided that the granting of this charter or letters patent should be celebrated, the manner in which it should be carried out will, of course, have to be carefully considered, but it has been proposed that there should be an exhibition for two or three months in the summer, and some special festivities on or about the actual date.

Two kinds of celebration are suggested:—(1) Exhibitions running throughout the summer. (2) Festivities on the actual date selected to celebrate the foundation of the old borough.

1. Three or four exhibitions of distinct types and of reasonable dimensions are suggested. It is a matter for consideration whether these should be gathered together in the same place or distributed in different parts of the city. There is much to be said for either course, but in either

case the exhibitions suggested below would serve a double purpose. They would stimulate civic pride and patriotism, and, especially in the young, encourage the growth of a higher citizenship, and they would bring Liverpool more prominently to the notice of other countries, and be the means of inducing visitors to the British Isles to spend some time in the city. The exhibitions suggested are:—

(a) An Exhibition of Ancient Liverpool. This should take the form of a reconstruction of the ancient castle (in lath and plaster, but on full scale), with its four towers, its chapels, its hall, its moat, &c. Though demolished in 1720, the castle is capable of reconstruction; the school of local history and the school of architecture at the University could supply detailed plans, partly conjectural, of course, but near enough for the purpose. To the castle might be added the tower, which stood at the bottom of Water Street till the nineteenth century, Liverpool having been almost unique in the possession of two Medieval fortresses within a stone's throw of one another. Perhaps one or two specimens of ancient domestic architecture (taken from Herdman's drawings) might also be added. The building or buildings might be erected in one of the public parks, or at Calderstones, or the Bowring estate, or on the Edge Lane Hall estate, or at some other convenient place. They should be used for the display of a collection of drawings, old maps and relics of all kinds, including some of the charters from the municipal archives. They should remain open throughout the summer.

(b) An Exhibition of Modern Liverpool, containing (1)

some representation of the activities of the various departments of municipal government, and (2) some illustration of the trade and industries of Liverpool, *e.g.* a series of models showing the various types of vessels which have crossed the Atlantic. This show should remain open throughout the summer, and in connection with it the great shipping lines and the big industries might be persuaded to give special facilities for visits to their vessels or their works.

(c) An Exhibition of the Liverpool School of Painters is already being arranged for. It should not be difficult to make this synchronise with the rest, and it would form an additional attraction.

(d) An educational exhibition would be of great value to teachers, and would form an additional inducement to the holding in Liverpool of a series of educational conferences already proposed for the summer of 1907. Such an exhibition should cost little. The buildings of the University might be utilised for the purpose.

All the exhibitions would help one another.

2. Under the head of special festivities or celebrations the following suggestions are made:—

(a) A pageant, or pageants, like that of Warwick, illustrating episodes in the history of Liverpool. For this the proposed models of the castle and tower would form the appropriate background. This might be given once or twice during the summer, the main performance being on the actual day of celebration.

(b) A great public service of thanksgiving for 700 years of prosperity, to which all public functionaries should go (in official costume wherever possible) in procession through the streets, which should be lined with the local volunteers.

(c) A review of merchant shipping in the river, with perhaps a visit of the Channel Fleet.

(d) Games, &c., in the parks for the children of the schools.

(e) An illumination on the river at night, ships lighted up.

(f) A medal might be struck in celebration of the occasion.

With regard to the cost of such an exhibition and pageant, the town clerk, after making some inquiries, thinks that a sum of at least 2,000*l.* would be required to enable a sufficient guarantee fund to be formed before any expense is entered into.

Charges, of course, would be made for admission to the exhibitions and for viewing the pageant, and it is hoped that ultimately there would be a balance in hand.

The scheme can be initiated in one of two ways, either by the Council itself forming a committee to carry it out or by the Lord Mayor calling a town's meeting, at which a general committee could be appointed for the purpose of organising and carrying out the exhibitions and raising the necessary funds.

As the matter, however, is principally one affecting the municipality, the town clerk is himself personally of opinion that, if the scheme is at all desirable, it should be initiated and carried out by the Council, and any committee appointed by the Council for those purposes might be authorised to co-opt other persons who would be willing to advise and assist the committee. If this course is adopted the funds required for the celebration could be obtained by an addition to the Lord Mayor's allowance.

There is also one other question which ought to be considered, namely, that of obtaining the services of some person who has been accustomed to organise exhibitions and pageants of this kind. Similar celebrations have already been held in Ripon, Sherborne, Warwick and Shrewsbury, and others are contemplated, and the town clerk understands that special masters of the ceremonies were appointed to arrange and conduct the proceedings. This is a matter which might be left to the committee having charge of the arrangements.

The report of the town clerk and the recommendations of the finance committee will, of course, be submitted to the next meeting of the City Council.

A Committee of the Dudley Town Council have issued a report dealing with the new free library scheme. They recommend that Mr. Nicol, architect, Birmingham, be engaged to prepare the conditions of the competition for the plans and designs for the library on the site already selected, that the competition be limited to architects practising within fifty miles of Dudley, that an assessor be nominated by the committee, and no prizes be offered.

"THE HOUR."

THE opening lecture of Professor Herkomer's course was delivered at the Royal Academy on Monday. By "The Hour" he meant the present time, and it was of the decadence of the art of the time that he spoke. There was, he said, a taint of decadence in the art of all ages. This age was no worse than the others, but we unfortunately were indifferent to its presence, owing to the complicated conditions of modern life and its mad rush, with no standing still and no time to look back. It was an age of "scorching," and his first message to the students was to warn them against "scorching" in art and to urge them to fight against the tendency. Before touching on the decadence of illustration, taken from its altar to provide amusement for the modern public, he wished to speak of the decadence of another kind, exemplified by a circle of French artists whose pictures were going the rounds of the principal German cities, where, unfortunately, they had aroused the curiosity of the continental public. Pointing to some pictures on the walls covered up with paper, the Professor said that these works, which they should see presently, were by artists who called themselves impressionists, whereas they should be called imperfectionists or idiotists. True impressionism was at the bottom of all our art. Turner and Holman Hunt, to quote two men of widely different view, both painted their impressions. The lecturer read some of the claims and views of the French impressionist artists from the preface to their catalogue, and said that the crowning joke was that they pretended to hang on to the old masters' traditions. He had always thought that these impressionists claimed to have discovered a new secret of seeing and that they alone were right. Professor Herkomer then removed the paper from the four covered works and showed huge black-and-white drawings, carefully enlarged from illustrations in the impressionist catalogue, of two figure subjects, a landscape and a seascape. "It would be difficult to do anything so bad, wouldn't it?" said the Professor. "Yet they still want the beastly colour." It must be, he thought, a mad freak or an effort to see how far the public could be fooled. Decadence was not necessarily a concomitant part of innovation. The pre-Raphaelite innovations came as a godsend to English art. The critics of the time, severe as they were on the "Carpenter's Shop" and other pictures of the same school, always allowed that the pre-Raphaelites possessed imitative skill, but this was the quality that the impressionistic paintings lacked beyond all others. "It's the badness of the work that knocks one over," remarked Professor Herkomer before he proceeded to describe one of the masterpieces of the school shown him by a disciple in Berlin. He asked the disciple if he thought the picture was a good composition? No; that was not its aim. Did he think it well drawn? That, again, was not its aim. Nor was colour, and of its real aim the lecturer was still ignorant. An alarming change was creeping over the art of illustration. The facility of the black-and-white artist of to-day was surprising, and although in Professor Herkomer's youth there were always a few men of outstanding excellence the present average of skill was far higher. Talking to one of these clever black-and-white men the other day he commented on this, and the black-and-white man said, "Yes, but your period of illustration led to the highest art—ours leads us nowhere." Partly the lecturer put down the decadence of illustration—despite its modern cleverness—to the decay of wood-engraving, an art that represented the combined efforts of the draughtsman and the translator. In his day he and his friends used to treasure prints from the woodcuts after Millais, Walker and others, but reproductions were not treasured now, he said, because they were from process blocks. The Professor claimed that finer results were got by wood-engraving than by process work, and that even in the reproduction of line drawings by photography the line was poor and scratchy compared with the full-blooded line of the woodcut. He showed the audience an enlargement of a woodcut by Bewick, and claimed that it lived, whereas if it had been a wash drawing reproduced by process it would be dead. Other examples shown included enlarged specimens of work by Menzel and Mr. Timothy Cole, and a wood-engraving after a picture by Sir Lawrence Alma-Tadema. He spoke of the excellent work done by the *Graphic* under the direction of the late Mr. W. L. Thomas. When he visited America in the eighties beautiful wood-engraving was being done in such magazines as *Harper's* and *Scribner's*, and when going through their printing

works he asked whether their engravers had been trained in Europe. He was told that they had not, and the examples they had followed were hanging up in the office. They were wood-engravings from the *Graphic*. Of course the process block was quicker and cheaper—800 per cent. cheaper—than wood-engraving, which was slow and dear. He condemned the snapshot photograph which the public liked, because it thought it must be true, and denied its truth. Compare the snapshot, he said, with the Parliamentary sketches of Ralph Cleaver, clever creations, the result of the brainwork of an artist who saw things through his refined temperament. But there were other reasons besides process for the passing of the wood-engraving. The first blow to it was given before the advent of process and given by Ruskin in one of his Oxford lectures. He did not wish to attack Ruskin—a great and good man—and regretted that a recent report in a newspaper had given that impression. But he was a misleading guide when he spoke against the art of the woodcut. In conclusion Professor Herkomer held out hopes for a revival of the art. "But," he said, "there is no time to be lost. The master engravers are growing old, and there are no new ones forthcoming."

HOLYROOD ABBEY CHURCH.

IN a letter to the *Scotsman*, Mr. John Watson, architect, writes:—Many architects have devoted a considerable amount of time to the study of the structural organisation of the Chapel Royal at Holyrood, and, as one of these, I venture to express my views upon the condition of the existing remains, with special reference to the report by Professor Lethaby, lately published in your columns. To me his contentions are not convincing.

The Chapel Royal, as now known, is merely the nave of the church of the once important and wealthy abbey founded by David I. The erection of this part was commenced about the end of the twelfth century, and was completed about sixty years afterwards. The plan shows that from the beginning the nave proper, as well as the aisles, was intended to be groin vaulted, and during the whole course of its erection no departure was made from the general dispositions. Two hundred years later massive buttresses, with flying arches spanning both aisles (some of which exist entire on the cloister side), were erected to strengthen the clerestory walls and to resist the vaulting thrusts which the earlier builders believed they had sufficiently counteracted by the thickness of the piers. During the sixteenth and seventeenth centuries it received various attentions, some of violence and spoliation by English invaders, and others of reparation, principally by Charles I. In the eighteenth century it fell into a period of continuous neglect—a neglect which vividly reflects the general indifference of the times regarding such structures—which finally brought about its doom. I am strongly of opinion that but for this the nave of Holyrood might have been standing till this day in all its beauty.

All its intermediate history bears more or less on the present condition of the structure, and it is necessary to understand it to appreciate the practicability of a successful restoration. Professor Lethaby says:—"The parts now remaining are but a small portion of the complete nave." This is minimising the extent of the remains. Anyone may see what exists to-day. What has disappeared is the main northern arcade with pillars (of these two fragments remain, giving clear evidence to their similarity to those on the south side), the triforia and clerestory, also the clerestory of the south arcade. The main vaulting and vaulting of the north aisle; the wall head parapets with their supporting cornices and corbels, the external flying buttresses, the upper portion of the western gable and the terminations of the circular staircases adjoining; also the roofs which covered in the whole structure.

Professor Lethaby reports rather discursively, but his chief points can be reduced to three heads, viz.:—

1. That the stonework is decayed and unsound.
2. That the walls are seriously off the vertical.
3. The problem of making anew lost parts.

1. As regards the decay of the stonework, Professor Lethaby says:—"The walls and arches which remain are much decayed by the weather and disintegrated by the action of smoke deposits . . . and the surface is everywhere attacked and blackened." This description is indiscriminate, and to condemn the whole is too summary. The Professor, however, assures us it is the surface only which is decayed and blackened. In my opinion these thick

walls and arches are perfectly sound otherwise. Professor Lethaby remarks that "the pillars of the south arcade have been very largely patched with cement, across which joints have been neatly struck," and concludes that they "consequently seem to be in a far better state than they are in fact." This is making the very worst of these pillars. I inspected them most carefully last week, and noted that they are built of an exceptionally good quality of stone. The cement was applied to make good the forms of the columns, &c., where the sharp surfaces had been broken by accidental violence, and one has only to examine the fragmentary pillars on the north side to understand how strongly they were bonded and built.

The Professor's conclusion should have been reversed. I am of opinion that these pillars are sound and strong. There are no indications of crushing or fracture, the joints are sharp and good, clearly showing that they bore the crushing weight which they were meant to sustain and have sustained for nearly 600 years. I see no reason to assume that they would not bear the weight of a restored clerestory and vault, or even a greater weight. Professor Lethaby also states:—"The triforium stage is in still worse a condition. . . . The last three bays to the east are formless in respect to mouldings and details." This is an overstatement of the case. They are doubtless much weather-worn, but certainly not formless, and their mouldings are distinct with the exception of some of the outer capitals. Mention is made of the sooty condition of several of the decorative features, but these points are quite irrelevant to the stability of the structure.

2. That the walls are seriously off the vertical. "Seriously" can only apply to the south wall of the nave containing the triforium. We are told on the best authority that it leans inward 14 inches. The reason is obvious to anyone viewing the wall from the cloister side. The simple way to correct this is to reinstate the main vault and the flying buttresses over each aisle roof. I may point out that the inward lean of this wall is an important factor in favour of restoration.

That the north aisle wall leans outwards 4 inches is of little consequence; it has been so for over 450 years, and it can never move again so long as the buttresses stand. The leaning of the west wall ($4\frac{1}{2}$ inches) has been counteracted by reducing its thickness at the top and loading it on the inner side (this wall is about 10 feet thick as high as the intake).

(3) The problem of making anew lost parts. Professor Lethaby states the form of the clerestory is unknown. He evidently made a very hurried study of the Chapel Royal or he could not have made that statement. The main vaulting has undoubtedly been sexpartite in form. The bonded springers of the vaulting arches exist. These give the start of the rib curves and the detail of each rib. The height of the crown of the vault is marked exactly on the east wall, and the height of the clerestory is defined by the wall ribs. There are vestiges of the north wall of the nave still adhering to the east and west walls, which clearly show that the north and south walls were counterparts of one another. On the north and south sides of the east and west walls the clerestory passage is distinctly visible with capital, shaft and base to the interior. The number, position and detail of the clerestory windows and openings are also known, and can be seen by any who care to take the trouble of verifying their existence. With these evidences I venture to say that the form of the clerestory cannot be said to be unknown.

Professor Lethaby also says that the form of the west gable is unknown. The west gable in its latest form at present exists to a height of about 60 feet above the door step. The east wall, which was altered into a gable, is standing, showing on it the pitch of the nave roof, therefore the west gable must have corresponded closely in height to that of the former. This being so the form cannot be said to be unknown. Moreover, there is an old measured drawing published which gives an interesting elevation of this unknown gable.

Professor Lethaby repeats that the new work would be largely copied and conjectured. I am of opinion that there is absolute authority in the existing work for nearly every detail required in the new work, which is, indeed, but a small portion of a completed nave. The Professor mentions a number of details of less importance, and asks what is to be done as regards broken string-courses, bases, &c.; also the late and debased work at the west end, regarding the date of which he has been misinformed. The date is given 1633 on the tablet, containing a very touching inscription,

above the west doorway. He points out that the floor level was lower than at present (the original floor level is distinctly marked at the crossing). No doubt the burials at a comparatively late date account for the fact of the present level being higher. But what have such trivial details to do with the general scheme of restoration or the stability of the existing building? The days of eclectic restoration are past, and there is no architect living so regardless of his own reputation as to think of touching or removing any of the work that exists. Is not the very essence of restoration to preserve and not to destroy?

BIRMINGHAM ARCHITECTURAL ASSOCIATION

AT a meeting of the Birmingham Architectural Association on the 4th inst., Mr. Arthur Dixon spoke on "Architectural Education," and suggested that the professional education which was now open in Birmingham to architectural students was incomplete on two sides, the practical and the scientific. Having reviewed the classes now open to architectural students in Birmingham, Mr. Dixon entered into a short digression upon the qualities which constituted a good building. Convenience in planning, solidity, combined with a due limitation of the quantity of materials to be used, presented problems with a view to which the present system of education afforded a not altogether inadequate preparation, though in these days, when materials such as steel and reinforced concrete were becoming of such great importance, the training which had been hitherto reserved for engineers became more and more necessary to the architect. If, however, the attainment of the utilitarian qualities of a good building demanded a more scientific training on the part of the architect, the case became even stronger when they thought of those qualities which had a more spiritual character. He used "spiritual" partly because he wished to avoid that much vulgarised and misused word "artistic." The word had to cover what was the greatest quality of all—he meant expression. There was a kind of expression which no building, however humble and however utilitarian, ought to lack—the expression of its own essential character and the expression which came from an exact and delicate adaptation of the means to the end in view. It was, he believed, this quality of expression which more than any other led the way to the interest and beauty and dignity of a building. One of the most delightful things in the world was a Mediæval fortress. He could find no better illustration of delicate adjustment of material to its purpose than the vaulted choirs of the great thirteenth-century churches, such as Westminster, Amiens, and most of all, Beauvais. The mastery over materials which was certainly attained by the Mediæval builders was no doubt gained on the job and in the workshop, without much, if any, help from university schools or books; but the materials which he had to study were comparatively few, and so were the purposes for which they were used, while the methods of their use might be said to have been included within the limits of a single living tradition with which it was quite possible to become thoroughly acquainted in the course of a few years of actual apprenticeship and practice. It was certain that could not be done now—other means must be found, and one of them was that architectural students should receive part of the training now given to engineers. They wanted a co-ordinated scheme for architectural students which would make it easy for them to get all the training they really ought to have; and one very great advantage which would follow upon this being done in connection with the University would be found in the splendid apparatus which was being provided there for testing materials of all kinds, whether in respect of tension, compression or transverse strains.

Some buildings looked as if the materials of which they were composed had been thrown together, others as if the materials had been bullied and kicked into their respective places; but the building which they loved to look at again and again was that whose materials looked as if they had been led together by a friendly hand, which had taken the trouble to study their characters, to find out what work each could do best and would do most happily, and had also taken thought to put each beam and each stone in that position in which it could perform its almost eternal function in self-respecting and happy tranquillity. They must learn to play with their stones and beams like friends, rather than order them about like a squad of

stokers. If it were possible to provide classes for students in which they would become familiar by actual practice with the work of the carpenter and mason, and perhaps the bricklayer and plumber, it would be of very great advantage. It would seem that on the practical side at least there was in Birmingham already in embryo and on paper the elements of what they wanted. An architect ought to have actual practical familiarity with a good many points, such as the various methods of finishing masonry, methods of bedding, bonding and pointing, &c. It was only by such practical familiarity with materials and their treatment that they might hope to avoid what had been for some long time the Scylla and Charybdis of their profession—the Scylla of the pedantic copying of ancient form, and the Charybdis of the fanciful and effeminate vagaries of the new art, which had sprung up to no small extent in brains unsanctified by wholesome contact with the stocks and stones of mother earth. The essential point was the co-ordination and direction of architectural studies, and he supposed the ideal solution would be a chair of architecture at the University. Liverpool had its chair of architecture, and they might have theirs in time. In the meantime, it would be of great use if they could have a committee to consider the whole question.

REBUILDING SAN FRANCISCO.

IN the course of the last letter written by the late Sir John Leng, LL.D., from Delmonite, California, and despatched thence on November 14, 1906, as printed in the *Dundee Advertiser*, he asked:—Did the infernal powers of destruction ever shake to pieces a vast city in so few seconds, and then fiendishly gloat over their work in such a widespread, fierce and consuming conflagration as raged over San Francisco from April 18 to 22 last? Were ever so many huge buildings so quickly reduced to skeletons, their bones alone remaining nude and gaunt to indicate former crowded hives of commerce and industry? Were ever so many human beings so suddenly made houseless and homeless, and compelled to live under the sky as their roof, and to maintain their existence by daily toeing the bread line, sick and poor, native and foreigner alike, to receive sufficient food to keep away the pangs of hunger?

Approaching San Francisco six months after the earthquake and fire, we heard alarming accounts of the dangers to life and limb from still falling buildings, from streets covered with iron beams and unremoved debris, and from Thugs and villains of all kinds ready to hold you up with their revolvers while they robbed you in broad daylight of all you possessed. Placing ourselves in charge of two experienced friends, long familiar with the place in all circumstances and conditions, we soon found how much exaggeration there had been, and on the whole we were astonished how much had been accomplished in removing the debris, clearing the roads and streets and expediting the work of reconstruction. The illustrated papers have given accurate photographs of the lofty buildings whose frames stood firmly after the earthquake, while most of the filling-in was shaken out, in some instances with very grotesque effects, the domes and upper portions of lofty towers appearing intact, while little but the iron framework of the lower sections remained.

In confirmation of the parable respecting those who build on rock and those on sand, there are three remarkable illustrations. The United States Government buildings—the Mint, the Post Office and the Custom House—were scarcely injured. These were all founded on concrete—artificial rock. As a rule buildings built on "the hard" natural ground stood comparatively well. It was on the swampy, loose, made-up ground that the greatest havoc occurred, and showy, lofty structures utterly collapsed, or remained as monuments of work more pretentious than substantial. There are still high walls far off the perpendicular, some of which are being assisted to their fall, while passers-by are warned not to approached too near.

Everywhere are the signs and sounds of extraordinary activity in clearing away obstructions, raising girders and building materials. The place is all alive with the activity of energetic workmen, working eighteen hours a day. Bricklayers, we were told, were earning 30s a day, and yet they are very scarce. All kinds of tradesmen were in great demand, but the supply was short. San Francisco is rising rapidly from its ashes. The United States flag floats everywhere in the breeze as if to announce to the world, "We are not downhearted." Every month will show more and more of the upbuilding process. Already many of the old

cleared streets are crowded with pedestrians, carriages, motors, waggons and buggies. The great fire, which extended over five miles, and the heat of which was more than seven times hotter than is wont at ordinary fires, fortunately did not cross a broad avenue on the western side. This is now the most crowded business street for shopkeeping classes. There has been a tremendous boom in property and rents in this region. A writer in the excellent local magazine "Sunset" says:—

"Van Ness Avenue, the widest residence street, Fillmore and Devisadero Streets, yet further west, at once became centres of trade industry. Houses that would not rent for 50 dols. a month before the fire brought 500 dols. readily. Then developed the leasing and sub-leasing industry. One modest druggist, whose profits from pills and potions had never exceeded 100 dols. a month, sublet his 75-dol. store for 600 dols. a month for three years, sold out his household goods, packed his family trunks, and sped away to live in Europe in affluence on the money that will reach him monthly without his working for it. The overland railways were soon congested with freight ordered by merchants to renew their stocks. Lumber camps all the way up the coast, far into British Columbia, felt the surging wave of industry. Every ship and barge that would float was put into service to carry cargoes of things needful for the city's upraising. The shout of architects and contractors was for concrete construction, and every cement factory in California was soon working double shifts to fill the demand. Cablegrams to Liverpool, Bremen and Melbourne soon started the loading of deep-water ships with cement and iron and brick, and thus the ill wind of the stricken city blew good to the far corners of the world."

Thousands of ground-floor stores ran up in all directions. Large private houses were rented for business purposes at from 300 to 600 dols. monthly, and converted into restaurants or dry goods stores. After a few weeks from the disaster the gaiety of San Francisco people led to the cafés and theatres being crowded night after night by merry-making throngs.

The appearance of the still-standing lofty buildings is often fantastic and grotesque. In some respects the impression is melancholy, but there is not that aspect of desolation one would at first expect. The sounds of mechanical activity all indicate a speedy resurrection from the ruin that remains. Then in the newly-erected streets of stores, banks and offices everything is on the whirr and the whiz, while in the older residential quarters, now converted into business streets, the movement and the rush are quite equal to the busiest parts of Chicago or New York. No one knows what may occur after San Francisco is built up again, but the rebuilders are going to work to replace the San Francisco of 1906 by a better-planned, grander and more imposing city of the future. The British insurance companies have provided the owners of property with ample funds. Whether those companies will renew their risks and obligations remains to be seen. It redounds to their credit that there has not been a single default on their part, while the demands upon them have been such as would have seriously shaken weaker concerns. A number of German insurance companies have not stood the test so well, being unable to meet their obligations, which will tell seriously upon their future business.

BELFAST CITY HALL.

A MEETING of the Council of the county borough of Belfast was held on the 2nd inst., when, says the *Belfast News Letter*, the minutes of the improvement committee dealt with the City Hall accounts, and stated that the attention of the architect having been called to the unsatisfactory acoustic properties of the Council chamber, he expressed the opinion that if the windows and galleries were draped and a change made in the heating and ventilating system a great improvement would be effected. It was resolved that this suggestion be acted upon.

Councillor Macartney, in moving the adoption of the minutes, said the city accountant had prepared a statement of the City Hall accounts, which showed the committee were authorised by the Council to expend 297,508*l.* out of the loan of 300,000*l.* The final accounts showed an expenditure of 288,865*l.*, or a saving of 8,643*l.* All the sub-contracts and furnishing contracts were settled and paid for, and represented an expenditure of 89,000*l.*; so there was only one serious matter arising out of the City Hall, and that was Messrs. Martin's account, which the committee said was 149,000*l.* and the contractors said was 215,000*l.*, the difference being due to the fact that the committee's price was based on

the contract schedule, and Messrs. Martin's on what they said the work cost them, plus 5 per cent. for establishment charges and 10 per cent. profit. Negotiations were at present taking place between the architect and Messrs. Martin regarding their account, and before any final settlement was arrived at the matter would be placed before the Corporation. The following is the

Approximate General Summary.

Site	£30,000	0	0	
Preliminary expenses	3,615	0	0	
				£33,615 0 0
Building contract (Martin's)	£149,000	0	0	
Building sub-contracts	77,000	0	0	
Furnishing contracts	12,000	0	0	
				238,000 0 0
Architect	£7,500	0	0	
Architect (furniture)	500	0	0	
Surveyor	5,200	0	0	
Clerk of works and miscellaneous	4,000	0	0	
				17,250 0 0
				£288,865 0 0
Margin				11,135 0 0
Amount of loans	£300,000	0	0	

Continuing, Councillor Macartney asked that the question of the accounts should not be gone into on that occasion, because they would be no nearer a final settlement if any discussion took place.

Councillor Shaw, in seconding, agreed that the accounts should not be discussed at present, as negotiations were going on, and he hoped they would end satisfactorily and in a friendly settlement rather than trouble. So far as the building was concerned, everyone felt that the contractors had given them a good job.

Councillor Henry said that was, he thought, the proper time to refer to the acoustic properties—or rather the lack of them—of the Council chamber. The matter had been brought up from time to time, and the Lord Mayor had suggested that he (the speaker) should confer with the architect at the meeting of the committee in order that some plan might be arranged. The architect had accordingly suggested that the windows should be draped and the galleries also hung with drapery in a temporary way in order to see what effect this would have. The architect also said that one could never be sure how the acoustic properties of a room would work out. He expected that the chamber would be perfect in this respect, but it was not; whereas an apartment which he designed at Woolwich, over which was a large dome, and which he thought would be an acoustic failure, had turned out a success. He (Councillor Henry) would remind Councillor Macartney that he had promised to have the drapery put up. At the committee meeting one or two members expressed the opinion that the seats should be rearranged in horseshoe form. The architect said the room was not designed to have the seats placed in this manner, and if they departed from the present arrangement the whole contour and success of the chamber would be irretrievably spoiled.

Alderman Lawther said he differed from Councillor Henry in regard to the acoustics of the chamber. These were entirely the result of the architect's plan. He for one objected to the way the seats had been located. When on the Continent he saw large halls in Brussels and elsewhere much the same size as that one, and the seats were in circular formation. He objected to their dealing with the chamber on the patchwork principle, as had been the case with that building. If they had followed out the original design of the architect they would have had many things that would have been a disgrace to Belfast. Now, as a result of the improvement committee's experience, they had a fine building. If they looked around that room they would see the cock-loft or the "crow's-nest" for the people, and now they wanted to go on spending money on drapery. The public audience should face the Council and have the "crow's-nest" done away with. He objected most strongly to any further patching and to any expenditure on drapery.

The Lord Mayor: That would not be patching.

Alderman Dr. King Kerr said it would be a mistake to put drapery in the Council chamber, as it would be out of keeping with the character of the room. It must be evident to those present that the acoustic properties had improved very much, and they ought to continue as they were doing a little longer without incurring further expense.

The Lord Mayor said the committee would bring in a report before going to any expense.

ARCHITECTURAL DRAWING.

A PAPER was read on Monday before the members of the Liverpool Architectural Society by Mr. Stanley D. Adshead, of London, on "Style in Architectural Draughtsmanship."

After a reference to the great originators of style, Mr. Adshead reviewed the various styles in use, and advocated the use of the French or academic style as the explicit style of draughtsmanship, taught to the exclusion of all others up to forty years ago, and asserted that only by the adoption of which could a really national style be founded and developed. The representation of really good architecture could only be done justice to in this style because the characteristic attribute of good architecture was refined detail. It was contended that for ordinary competition purposes this style demanded too great an expense of energy and time, but it was impossible to make explicit drawings hurriedly and well in any style. The prevalence of thick line drawing was, however, due to stress of competition, and it suggested that the architect was not confident of his own ability to make a display of grace and refinement or had not confidence in the assessor, so that he tried to captivate the latter by a display of brute force. He hoped assessors did not give their awards on a mere display of good black work. The prevalent thick line was responsible for the poverty of detail which appeared in the modern municipal and the Carnegie library as compared with the interior of the Banqueting Hall in Whitehall, and he ascribed this degeneracy to our coarse manner of drawing.

A discussion followed the reading of the paper.

BOND BETWEEN CONCRETE AND STEEL.

A CONSIDERABLE number of valuable tests of the bond between concrete and steel were recently made at the University of Illinois. They were made with plain round bars, cold rolled shafting, mild steel and tool steel embedded in concrete of different proportions. The experimental work was done by Mr. Todd Kirk, and a description of it, with a summary of the data, was recently prepared by Professor A. N. Talbot. The conclusions he draws from the experiments are the following:—

Little difference is found in the bond resistance per square inch of surface of bar in contact with the concrete, whether the bar is embedded 6 or 12 inches. Evidently a length may be found beyond which the stretch of the steel would cause uneven distribution of the bond stress along the length of the bar and cause failure to begin at the point of the greatest stress in the steel, and thus give results not representative of the real bond resistance. This limitation applies to lengths for use in experimental tests of bond. In simple beams the bond stresses are applied along the length of the bar, and stretch and bond exist together.

The richer mixture of concrete gives somewhat higher bond resistance than the leaner, the values for the 1:2:4 concrete averaging, say, 10 to 15 per cent. higher than the 1:3:5½ concrete. For plain round mild steel rods the average for the bond resistance ranges from 350 to 450 lbs. per square inch of contact surface.

Flat bars gave much lower resistance than round iron bars. Only three tests were made with flat bars, and these may not be representative. It may be noted that the results with flat bars are much lower than tests made elsewhere. It should also be noted that for a bond stress of 125 lbs. per square inch the tensile stress developed in the bar was only 9,000 lbs. per square inch.

The value of bond resistance will depend upon the smoothness of the surface of the bar, the uniformity of its diameter and section, the adhesive strength of the concrete and the shrinkage grip developed in setting. The effect of smoothness of surface and uniformity of diameter and section is seen in tests made with cold rolled shafting and tool steel. The average bond developed with cold rolled shafting and tool steel was 147 lbs. per square inch of contact surface, as compared with about 400 lbs. for ordinary plain, round, mild steel rods. It should be stated that not only was there a very noticeable difference in the smoothness and finish of the surface of the rods, but the section of the cold rolled shafting and tool steel was very uniform, the diameter not varying more than 0.0001 or 0.0002-inch at ¼-inch intervals throughout the length, while mild steel rods will vary as much as 0.0015 inch. It is to be expected that the smoothness and uniformity of section of drawn steel wire will operate to give low values of bond resistance, though,

of course, as the section of the wire is small compared with the circumference, the bond stresses developed when wire is used are relatively small. Attention is called to the fact that in the reinforced concrete beams tested at the University the bond stresses developed in beams failing by tension of the steel, diagonal tension of the concrete or other similar methods amounted to from 73 to 193 lbs. per square inch. Even at the breaking load, then, the bond stress developed in the mild steel rods was far below the bond resistance found in these tests.

COSTLINESS OF THE PENNSYLVANIA CAPITOL.

THE Attorney-General for Pennsylvania having demanded from the architect of the new State Capitol an explanation of his method of inviting bids, the following reply of the architect, Mr. Huston, is reprinted in the *American Architect*:—

In answer to your letter relative to the special furniture and fittings for the new Capitol building, I beg leave to reply as follows:—

The specifications were prepared in the usual manner in my office—that is, a description of the kind and quality of the articles required—and these specifications were prepared by me.

The knowledge I had relative to this subject was obtained during over twenty years in the practice of my profession.

Regarding my knowledge of the "per pound" and "per foot" rule, I would state that this principle of unit prices which you refer to was used by me in the specifications of the Capitol building, of which you have a copy, and which on page 18 read as follows:—"Each bidder must state the unit prices called for on the blank form of proposal; and said prices will be used as a basis in the valuation of changes that may be required in the work and as further stated hereinbefore." The form of proposal, upon which estimates were given by contractors for the construction of the Capitol building, contained the items upon which unit prices were required.

I enclose herewith a copy of this form of proposal for your information, which you will note contains sixteen items, upon each of which an estimate is required, either by foot, yard, perch, thousand, or by the pound. I may also state that the above-referred-to clauses in the specifications and the forms or proposal are similar to those used by architects employed by the United States Government, other commonwealths and city governments, and in good private practice. This being my first public work of this character, when I saw the system had already been adopted in the schedules of the State for years past, containing items calling for articles by the foot and by the pound, it was evident to me that it should be continued and used to cover the equipment of the new Capitol building.

This method is generally used by the trades in making up prices for bids, and is the common practice all over England.

I know in the practice of the arts in all lines the "per foot" rule is applied for the determining of costs and in the giving of bids by the above rule for wainscoting, bookcases, wardrobes, mantels, overmantels, cabinets, &c., and in the schedule of 1904 the items for specially designed furniture for the new Capitol building were framed to extend this principle to tables, chairs, desks and other articles of furniture.

I also know all metals are bought by the weight.

Upon investigation and research for lighting fixtures of good quality and methods for buying same, I found that one of the finest examples for this quality of work and the method of having it performed so as to bring about the best ultimate result was placed in the residence of Mr. William H. Vanderbilt, in New York, where all special lighting fixtures were paid for by the pound in preference to by the piece, and that a more satisfactory and artistic result was obtained by this method.

I had in mind a standard of metalwork for this building which was beyond anything yet accomplished in this country. My precedent for the great bronze standards was obtained from the Pantheon at Rome and the altarpieces in St. Mark's in Venice, where I had replicas made for my guidance in obtaining a standard of excellence in this work.

Generally stated, if a bidder desired to bid by the piece instead of by the foot he had the design of each piece and

a specification at hand. He could find the number of feet from the drawings, which were made to scale, and reduce it to the foot rule as requested by the schedule without any difficulty. There are two systems of determining the quantity of materials, weights and measures, and in many cases the one is used to determine the other.

In regard to the conferences with prospective bidders who are seeking business in my office, there are hundreds of them in the course of a year. I do not recall any of the nature you suggest.

I searched many places for precedents in this country and Europe. I visited Albany, Providence, Boston, New York, Washington and many other places, and necessarily had many conversations relative to this work, for I have done nothing but think and talk of this matter for many years. The only conference I recall relative to the preparation of the schedule for the articles required for the equipment of the Capitol building prior to the publication of the schedules was in a meeting of the Board of Commissioners of Public Grounds and Buildings, at which all members were present, as well as yourself. I then went into the subject at length, and the Board adopted the unit-price system and had it incorporated in the schedule.

I gave my professional judgment, and I now think, as I did then, that it is the fairest system for the State on such unusual work.

No bidders made suggestions to me prior to the preparation of the schedule.

John H. Sanderson (the contractor) did not make any suggestions to me prior to the publication of invitations for bids or while schedules were being prepared.

I have no knowledge of the names of the bidders whose bids were opened. I have no record of them on file. Previous to each advertising I had no conferences or conversations with such bidders. Having had no such conversations, I was not affected in my judgment by the same and did not adopt any suggestions by bidders in whole or in part, and did not incorporate any such into the schedules.

I did not suggest the placing of Item 2 in the schedule and do not know what it was intended to cover. I would further state that I did not suggest any of the items from 1 to 20 inclusive in the special schedule.

I was asked by the Board to prepare such items only as would be required for the special furniture and fittings which would come under my supervision.

My answer to your eighth, ninth and tenth questions is the same as above, as they relate to Item 2.

A special design does not necessarily call for the "per foot" rule, neither does it necessarily for the "per piece" rule; the unit-price system having been adopted for the schedule, it was so adopted to this furniture. A special design is made to order after detail drawings, and is not ready-made from stock. For example, in a room the architectural style of which is French the furniture would be designed in the French style; in a Doric room, Doric detail; in a Corinthian room, Corinthian detail; Greek room, Greek detail; English room, English detail; Gothic room, Gothic detail, &c.

This illustrates to you the theory of design which was applied to the Capitol building, the idea being to produce a harmony of design in each room.

The drawings and specifications were on exhibition in this office on the days authorised by the Board from about May 7 to June 7, 1904. I did not keep a list of the various firms estimating on the work. The drawings were examined during office hours, from 9 A.M. to 5 P.M.

No objections are on the file in this office, and no communications of that character were received, and therefore no report made to the Board for the reforming of the schedule.

You will note on page 14 of the Capitol building specifications the following clause relative to verbal inquiries:—

"Neither the commission nor the architect will be responsible in any manner for verbal answers given to inquiries regarding the meaning of drawings and specifications or for any verbal instructions, whether by themselves, their employes or others, in advance of the award of the contract. The bidder will be responsible for any and every error in his proposal."

A similar clause is in all specifications for this work. The reason for such a clause is, an architect must so protect himself and his clients against any such irregularities as your letter suggests.

I have devoted conscientiously five years of my life to this work.

I was called upon by the Commonwealth of Pennsyl-

vania to design a Capitol commensurate with her dignity. My issue was to produce a building which would combine utility, stability and beauty. I gave my best, and all of the artisans and artists employed on the building have given their best, and I repudiate the insinuations that are being made. We have tried to do our duty honestly and well. If I have made any mistakes, they are mistakes of judgment and not of intention, and I stand ready to do all I can to correct them. I based all my judgments upon the highest precedents, and followed the instructions of my clients to the best of my ability.

In regard to extravagance, I say there is no extravagance—there is richness of design. We must advance artistically as well as commercially, and this building is the artistic expression of the culture of this great State, which will tell of us to coming generations.

Art is not a necessity, but architecture is one of the last refining touches which strikes a problem, and it is richer when embellished by the sister arts of sculpture and painting, as this building will be, and I believe thousands upon thousands of the good people of this and other States will enjoy this work for all the coming years, and the total cost of it of one dollar per cubic foot, including all the sculpture, painting, furniture, document filing cases, vaults, lighting-fixtures, art bronze and all expenses, is reasonable and capable of being favourably compared with any other public or private structure of a like monumental character, and since, in the Capitol building time was one of the important features of the contract, so, in my instructions from the Board, all diligence and despatch would be used. The completion of this entire work within the time of forty-six months and occupied by all the departments of the State is unprecedented.

THE SIMPLON TUNNEL.

AT the meeting of the Institution of Civil Engineers on Tuesday, Mr. Francis Fox read a paper on the Simplon Tunnel. The author said that the chief feature of the route followed was the small altitude above sea-level, 2,313 feet. The Arlberg Tunnel had a maximum altitude of 4,299 feet. The Simplon Tunnel was the longest in the world. Instead of one tunnel for a double line of way, it was decided to make two parallel single line of way tunnels 55.8 feet apart connected by oblique cross passages, and experience had fully justified the choice of this method of construction, but for which it was likely indeed that the work would have had to be abandoned. There were many advantages arising from this arrangement, including improved ventilation, reduced pressure on the tunnel lining, increased facilities of transport and drainage during construction, safety in working the traffic and better facilities for maintenance. The complete tunnel measured 16 feet 5 inches in width and 18 feet $\frac{1}{2}$ inch in height above rail level, being lined throughout with masonry. Only one tunnel had been completed to the full section up to the present time, the second gallery being left as a heading, to be completed when the traffic justified the expense. Ventilation during working was effected by means of fans and the whole works were kept remarkably fresh. When hot springs were met with the air was cooled by means of jets of cold-water spray, and though in the St. Gothard Tunnel a temperature of 93 degs. F. proved in many cases insupportable, yet in the Simplon, owing to the excellent ventilation, a temperature of 133 degs. F. was made bearable. There was a distinct relation between the temperature of the tunnel and the height of mountain above it, and he might point out that the Simplon reached the greatest depth below the surface of the earth at present on record. Work was hampered on the Italian side through a subterranean river and hot springs, and it was eleven months after work on the Swiss side had been abandoned that work at the Italian end was completed. The cost of the tunnel was 3,200,000*l.*, which worked out at about 148*l.* per lineal yard, and the period occupied in construction was 6 $\frac{3}{4}$ years.

The Dean of York has written to the Lord Mayor and Corporation of York requesting that steps be taken to prevent any tramway line being laid down near the Minster, either by the Corporation or by a company. The Dean has sent this communication in view of the tramway proposals now before the public, and the Lord Mayor has assured Dr. Purey-Cust that the matter will be put before the Corporation in due course.

GENERAL.

Mr. George Ayscough Wilkinson, of Monkenholt, Hadley Green, Barnet, and 7 Poultry, surveyor, who died on December 4, left a fortune of 40,345*l.* gross and 40,061*l.* net.

A General Assembly of the Royal Scottish Academy was held on the 4th inst., Mr. Hippolyte J. Blanc, deputy-president, presiding. The following associates, recently elected, were presented with their diplomas and relative medals:—Mr. R. M. G. Coventry, painter; Mr. Percy Portsmouth, sculptor; and Mr. James Miller, architect. The general assembly unanimously resolved to place the following artists on the list of honorary members of the Academy:—Sir Thomas Drew, P.R.H.A.; Mr. John F. Sargent, R.A.; and M. Auguste Rodin.

The Stockport Town Council have authorised an application to the Local Government Board for permission to borrow 21,000*l.* for the completion of the town hall. It was stated that the original estimate for the building was 66,000*l.*, but there was such a hurry to get the foundation-stone laid that several items were overlooked. The total cost would be just under 100,000*l.*

A Proposal has been made at York that the old moats should be laid out for recreation purposes, but a committee of the City Corporation which has had the subject under consideration says it cannot recommend that this should be done.

The Bishop of Liverpool is about to open a fund for the collection of 100,000*l.* He states the diocese requires twenty additional churches, at least forty additional parish halls for Sunday schools, and vicarage houses.

The Fate of the Ruins of Glastonbury Abbey remains undecided, and the property is still in the market. A Taunton antiquarian has received a communication from the Office of Works stating that they have no intention of buying the ruins.

The Authorities of Chester Cathedral take precautions against the risk of fire in the building. Some years ago the insurance of the cathedral was substantially increased, and the amount to which the fabric itself is protected is 64,800*l.* In addition there are two separate insurances for 1,600*l.* and 250*l.* The building is furnished with fire-extinguishing appliances.

Lord Aldenham is willing to provide the cost of alterations to the organ at St. Albans Cathedral, which at present occupies a position above the St. Cuthbert's screen, separating the nave from the choir, and seriously impeding the view from west to east. It is his intention, subject to the necessary faculty, to have the organ divided into two parts and inserted in the arches on the north and south above the screen, and at the same time to have it enlarged. Plans for the work have been already prepared by Messrs. Abbott & Smith, of Leeds.

The Autumn Exhibition of Pictures at the City Art Gallery, Manchester, which opened on Tuesday, September 18, was closed on Saturday. The admissions during this period numbered 122,805, a considerable advance on the number recorded at the last exhibition (93,690), after allowing for the difference in the duration of the two exhibitions. The sales at the recent exhibition have numbered only twelve.

In the Cloister of the church of St. Bartholomew the Great, West Smithfield, there has been placed the manuscript of a book written in 1554 by William Peryn, the Dominican prior of St. Bartholomew's during Queen Mary's reign. The manuscript has been presented to the church by a member of the restoration committee.

The Restoration of the west end of Hereford Cathedral, the cost of which is estimated at 14,800*l.*, has been suspended for a year owing to lack of funds. Dean Leigh has now issued an appeal for 3,000*l.* for its completion. Six new subscribers have promised 100*l.* each. The work was begun six years ago, and all that now remains to be erected is the front of the south aisle.

The St. Annes Urban Council decided to apply to the Local Government Board for powers to borrow 3,500*l.* for extending the South Promenade in accordance with the surveyor's scheme. An ornamental lake will run the entire length of the extension, and there will also be a rustic bridge, a fountain and a fish pool. On the sandhills will be placed shelters, arbours and pavilions. A bandstand with seating accommodation for 1,000, amphitheatre style, is also provided for. A feature of the extension will be an ornamental lighthouse rising 50 feet high out of the sandhills, with a look-out on the top.

The Edinburgh Art School Committee have approved of a plan by Mr. Peddie, architect, in which he has rearranged Mr. Pittendrigh Macgillivray's plan so as to bring the cost to about the 40,000*l.* which was the sum agreed to be spent on the building. The committee decided to advise the Lord Provost's committee of the Town Council to approve of the plans, take steps to have the matter gone on with and have estimates prepared.

The Manchester Education Committee propose to purchase the Platt Hall estate, containing 77 acres, to erect a college or colleges, and to use the surplus lands for playing fields.

Messrs. Waterlow, Bros. & Layton, Ltd., have produced their "Architects' Diary," with its complete list of members of societies, building memoranda and other information, the paper as usual being of fine quality.

Mr. Banister Fletcher will lecture at the University of London on Monday upon "The Temples of the Romans."

Messrs. Chatterton & Couch, A.A.R.I.B.A., late of 6 Gordon Place, have removed to 82 Victoria Street, S.W.

The Health Committee of the Sheffield Corporation recommend an expenditure of 43,850*l.* on enlarging all the public baths of the city, and providing sites for new baths for Walkley, Darnall, Brightside and Wincobank.

The County Councils of Anglesey and Carnarvonshire have declined to accept Telford's suspension bridge unless a large sum was granted for the maintenance of the structure.

A Design by Mr. L. Fritz Roselieb, of Clapham, has been adopted for the drinking fountain, 21 feet high, surmounted by a figure of St. George, which is to be a memorial of Sir Wilfrid Lawson at Aspatria.

The Manchester Cathedral authorities have removed from the north aisle of the choir the memorial-stone to Sir John Huntington, the first warden (from 1422 to 1458), whose rebus—a huntsman with dogs in chase and a tun—is to be seen on either side of the choir arch.

Mr. Frank H. Mason, the American Consul-General at Paris, in a letter to the Washington Bureau of Manufactures, discusses the underlying reasons why France excels in the production and sale abroad of such a wide range of manufactured goods. He considers the principal one is the national instinct of artistic taste, fostered and developed by education and governmental influence until it has become a national attribute. It is this which enables French ateliers and workshops to turn out the choice products which defy the tariff walls of other nations, and make Paris the Mecca not only of a vast multitude of cultivated amateurs, but of the merchants from foreign countries who deal in the choicest and most valuable forms of merchandise. France is industrially prosperous because she commands the rarest and surest of assets—the æsthetic taste which creates models and standards for other peoples, and the consummate handicraft which multiplies in the product ten, twenty, or a hundred times the value of the material of which it is composed.

The Executive Council in charge of the arrangements for the Scottish National Exhibition that is to be held in Edinburgh next year have agreed to appoint a Scottish architect of standing to act as assessor in the competition for plans, and practically to adopt the regulations as to architectural competitions prepared by the Royal Institute of British Architects. In the instructions given to architects it is pointed out that provision must be made for a conservatory shelter, a concert hall to accommodate 2,500 people, with platform and accommodation for large orchestra and organ, a permanent bandstand and a bridge over the Water of Leith. The architect of the design that is awarded the first prize will be appointed architect of the exhibition, the author of the second prize design will receive 100*l.*, and the author of the third 75*l.* Architects will be advised by the executive to keep in view, in preparing their plans, that the entrances to the grounds are to be:—(1) By the bridge over the Water of Leith, adjacent to the car terminus at Gorgie; and (2) by Balgreen Road, which probably will be the main entrance. It is also suggested that the architects should show a general scheme of laying-out the grounds, garden and river for exhibition purposes, and that in connection with the buildings they should introduce any exhibit, amusement or other attraction which they may consider desirable. It is expected that the work of erecting the exhibition buildings at Saughton will be begun early in the summer.

The Architect.

THE WEEK.

THE president of the Royal Hibernian Academy, Sir THOMAS DREW, has informed an interviewer that the Academy, mindful of its trust towards its charter and foundation, and of the position of an academy of arts in other countries, has been prompt, by resolutions already published, to repudiate the "recommendations" of the "majority" report, and would under no circumstances accept at the hands of the Treasury any obligation for paltry repairs of its old buildings in Lower Abbey Street, or its benevolent suggestion of a surrender of its independent charter, such as it is, for some other. If the Academy could become independent of State aid it would be advantageous, for more strenuous efforts might then be made to render exhibitions attractive and to induce the students to make more constant efforts for advancement. That can only be done by self-sacrifice. If Irish pictures were more often seen in the exhibitions of the Royal Academy, and if they had acquired a value in the English market, there can be no doubt that people in Ireland would become more appreciative of their countrymen's talents. We live in an age of tests, and unfortunately Irish artists shirk those which are considered to be decisive. They paint and draw for their easy-going countrymen alone, and people who assume they are possessed of taste are dissatisfied, it may be from applying standards which are not adapted to the circumstances of Ireland.

AMONG the sculptors who may be said to represent the new era in England was Mr. EDWIN ROSCOE MULLINS, who died on the 9th inst., in his fifty-eighth year. He was one of the students who issued from the Lambeth School of Art. Then for a time he studied in the schools of the Royal Academy, and afterwards he worked in Vienna and Munich. He began exhibiting in the Royal Academy in 1873, and between that time and the present there were only three or four years in which he was not represented. His portrait busts were numerous, and included Mr. PRESTWICH, the geologist, Sir ROWLAND HILL, the Rev. J. MARTINEAU, VAL PRINSEP, R.A., Sir EVELYN WOOD and others. He early gained a reputation by his representation of children. His statuettes were so attractive it seems strange that no art dealer was to be found who would endeavour to reproduce them, for it might be supposed they would be as popular in England as similar works are in France and Germany. Although examples could not be shown in the Academy, he rendered good service to architecture by his decorative works. Among the public buildings where his work is to be seen are the town halls of Sheffield, Hackney and Croydon. He believed that the subjects for decoration must vary according to the nature and object of the building itself, and the sculptor should not be bound by any hard and fast rule concerning applicability. Unless he is allowed full freedom it is likely that a lifeless uniformity will be the result. Nor did he consider modern costume was an obstacle to the representation of modern men in public buildings, for he argued that the figures of GOETHE and TURNER on the podium of the Albert Memorial are as interesting as any of their companions who are in fancy dresses. ROSCOE MULLINS appeared destined to execute many public works, but those we have from his hand are sufficient to give future generations some idea of his powers as an artist.

THE question of local *versus* general tendering arose in connection with a new library at Hove. Mr. CARNEGIE offered to give 10,000*l.*, and on the first trial the designs submitted in competition were not considered satisfactory by the assessor. The second attempt was

more successful. The tendering for the building was close, and the lowest, which came from Messrs. MINTER & Co., of Putney, amounted to 9,999*l.*, which certainly was very near to the sum at disposal. The library committee by five votes to two recommended that the tender of Messrs. PARSONS & SONS, a local firm, which amounted to 10,238*l.*, should be accepted. Mr. F. G. MINTER having heard of the proposal wrote to the town clerk expressing his surprise, stating that his firm had gone to the expense of preparing estimates in the belief that the lowest tender would be accepted providing the firm was competent to do the work, and he appealed to the Council for fair treatment. They had, he said, already carried out several Carnegie libraries; his firm would employ the same amount of local labour as any local firm. It must be admitted the choice between the two contractors was difficult, for Messrs. PARSONS were said to be among the largest ratepayers of Hove. A long discussion took place, but eventually fair play prevailed, and the Council decided by twenty-two votes to eleven on the acceptance of the lowest tender. It would take a large space if we endeavoured to explain why it is that local firms so often fail in the contest with those who live at a distance. The struggle for existence in London is so intense that it has an effect upon the productive power of all classes. Work is executed more leisurely in the provinces, and although the difference in any branch of trade may be very slight, yet on the whole it becomes a sensible advantage. In that way, no doubt, the 2½ per cent. difference between the two tenders for the Hove library may be accounted for.

OWING to the resignation of Mr. JOHN HUTCHISON, sculptor, who filled the office for twenty years, Mr. HIPPOLYTE BLANC has been elected treasurer of the Royal Scottish Academy. According to the *Scotsman*, Mr. BLANC, although of French parentage, was born in Edinburgh. He was a pupil of the late DAVID RHIND, architect, and for two years before engaging in the practice of his profession on his own account was chief assistant in the office of H.M. Board of Works. He was elected an Associate in 1892 and Academician in 1896. Mr. BLANC, who is a Fellow of the Royal Institute of British Architects, a F.S.A.Scot. and a J.P., has held many honorary positions. He has been several times elected President of the Edinburgh Architectural Association, he has been vice-president of the Scottish Society of Arts and President of the Edinburgh Photographic Society. Among other public buildings he has designed and erected are the Thomas Coats Memorial Church, Paisley; St. Cuthbert's Church, Edinburgh; the Edinburgh Village Asylum, Bangour; and he was the architect of extensive restorations, including that of the Old Parliament Hall at Edinburgh Castle. He is the author of numerous published articles on architectural and archæological subjects. At the same meeting Mr. W. D. M'KAY, R.S.A., the landscape-painter and author of a book on the Scottish School of Painting, was elected secretary in succession to Mr. GEORGE HAY, R.S.A., who was secretary for a quarter of a century.

THE directors of the Northern Polytechnic Institute, Holloway, have done well to engage Mr. HUGH STANNUS to deliver a course of twenty lectures on "The Evolution of Architecture," from Egyptian beginnings to "The New Style in Britain." The first lecture was delivered on Wednesday, and the last will be given on July 3. The fee for the whole course is only 15*s.* The lectures will be delivered on Wednesday afternoons from four to five, and they will be illustrated by slides, drawings, models, &c. The students of the Holloway Institute as well as others now have an opportunity of obtaining a large amount of valuable information from a competent teacher at a trifling cost, and they should not fail to take advantage of it.

SIXTY YEARS AGO.

THE selection of a period which is separated from our own by sixty years has the sanction of the illustrious WALTER SCOTT. When he started his incomparable series of novels he said the title of the first was selected with grave deliberation. Happily for him "Tis Sixty Years Since" was sufficient to recall a kind of life which was strange to the majority of the readers of "Waverley." But in modern times such a number of years are not marked by events like those which were described by SCOTT. The survivors of men who lived in 1847 are not few, and happily some among them will, we know, read this article. They may be dissatisfied with it, for few writers are competent to restore the past and to give a picture which witnesses can confirm. All we propose to offer are some incidents which occurred.

If compared with the revolutionary year which followed it, A.D. 1847 may appear to be uneventful. But it was not without its importance on the art of England. It was then ROBERT VERNON presented his great collection of the works of British artists to the National Gallery. The extent of it is not to be measured by the number of pictures now to be seen in the rooms assigned to English art. He possessed a great many other paintings. But the authorities preferred to make a selection which, it must be allowed, is extensive, for there are over 150 paintings. It is remarkable that the donor when purchasing chose all the paintings himself, for he could rely on his unaided judgment, and he always preferred to buy his pictures in the studios of the artists rather than have recourse to agents. Prior to 1848 there were donors of pictures in England; but Mr. VERNON was the first whose gifts were on a scale of princely munificence. Since that time the presents of pictures and drawings to public galleries from individuals have often been on a scale which suggests that Mr. VERNON's example will be always effective.

The VERNON collection enabled ordinary English people to study modern works for the first time. Academy exhibitions are like spectacles which pass quickly. The National Gallery in 1847 was mainly representative of Old Masters and of foreigners. It possessed a few portraits by REYNOLDS, landscapes by RICHARD WILSON and GAINSBOROUGH, a classical painting and a Scriptural painting by BENJAMIN WEST, a portrait of JOHN KEMBLE by LAWRENCE, and some examples of DAVID WILKIE. VIARDOT was amazed when he could see no specimens by LANDSEER or other contemporary artists in the Gallery, and water-colour art, which he considered to be especially the national art, was rigorously excluded. Mr. VERNON used occasionally to permit people who applied for permission to see his paintings in his house in Pall Mall; but, by making over the property to the country, he enabled the nation to realise for the first time that modern British artists could produce works possessing an interest which was absent from examples by older and, it may be, greater painters.

The inhabitants of the Metropolis and visitors to London possessed an advantage in being able to see such works as well as the other examples in the National Gallery, while in the provinces pictures were rarely enjoyed. In 1847 the Trustees were subjected to much criticism. They were cramped for space in Trafalgar Square, for the area of the Gallery sixty years ago was much less than it is at present. The consequence was that several paintings which were offered gratuitously had to be rejected. We can now suppose that the Trustees were justified, for they wished to establish a high standard. Sir ROBERT PEEL, however, advised them that they should accept all meritorious works which were offered to them, and if they could not be retained for the National Gallery, they should be sent to towns in the provinces, where they would be useful and serve as first instalments of public collections. Such a suggestion reveals to us the benighted state of

the provinces. No statesman in 1907 would venture to recommend that works of art which were not good enough for London were adapted to please people in country towns. This circumstance by itself suffices to indicate how much progress is attained outside the Metropolis in acquaintance with works of art.

The year might also be considered memorable for another reason, as in 1847 was held what became known as the Westminster Hall Exhibition. The erection of the Houses of Parliament inspired a project for decorating the buildings with frescoes and other paintings in a systematic manner like those in France and Germany. A Commission of Fine Arts was appointed; the two historians MACAULAY and HALLAM were among the members, for historical paintings were to have preference. They resolved that the House of Lords should be first undertaken and that frescoes, stained glass and statues should be prepared for its adornment. The subjects were fixed and the artists appointed for that purpose. But it was also considered desirable that pictures should be placed in other parts of the buildings, and it was therefore proposed that artists should prepare examples of their works which they deemed to be suitable. A large number of paintings were submitted, and they were exhibited in Westminster Hall. With the exception of two members and two Associates the Academicians of the time stood aloof. Three pictures at 500*l.* each, three at 300*l.* each, and three at 200*l.* each were recommended for purchase, but the money paid for them was obtained not from the Treasury, but from the shillings which were given for admission to the exhibition. The Commissioners, having gauged the extent of the talent which could be employed, prepared a vast scheme for the future decoration of the palace at Westminster, but it was not fully realised, and never will be apparently. In spite of the partial failure the project was not without its advantages. It enabled people to perceive that the decoration of a building could serve educational purposes, and it also revealed that many painters who could produce pretty pictures which were made the subjects of engravings were incompetent when they attempted to treat events which were adapted to a public building. Failures have been important factors in the education of Englishmen, and among them we must include the Westminster fiasco.

The discussions which related to the management of schools of design in 1847 would by themselves be sufficient to show that men who assumed to be authorities on education, manufactures and art did not possess the ability necessary to deal with such a problem. Unfortunately it cannot be said that after sixty years of muddle the solution has been arrived at. Investigations were made by committee after committee, teachers were changed, new rules were laid down, amended and superseded, and yet in December the authorities of the school in Somerset House were as doubtful about what had to be done as in the previous January.

The Westminster project made painters acquainted with the principle of competition, but they were sceptical about its value. One curious instance may be mentioned. A couple of speculators offered 1,000*l.* for the best representation of the Baptism of CHRIST in the Jordan. It was expected that a large number of works from the Continent as well as England would be submitted and the materials provided for a profitable exhibition. But on the appointed day it was found there were only eleven paintings. They were deposited in the Chinese Gallery at Knightsbridge. One of the conditions of the competition was that the competing artists should become the assessors and jurors. They were first to select ten of the paintings, then five out of the ten, and eventually one. The first operation was not difficult, for it simply consisted in determining who was to be excluded, and a Mr. AP HUGH became the victim. Then the fun commenced. Each painter naturally gave a vote for himself and added four other names. Some artists, after a few turns, retired in disgust, and

eventually the voting became as erratic as that of suffragettes. Some time later it was declared that the competition ended in favour of Mr. Wood. But whether the speculators were unwise to part with their money under such extraordinary circumstances was never known.

One distinguished competitor of 1847 should not be overlooked. In 1845 the young JOHN EVERETT MILLAIS entered into a contract with an ex-serjeant-at-law to paint small pictures or backgrounds, receiving in return 100*l.* a year. There was a row between the parties. But in 1846 the lawyer paid "Master MILLAIS" 5*l.* for a sketch. In 1847 MILLAIS sent *The Widow's Mite* to the Westminster Hall Exhibition. It measured 10 feet 7 inches by 14 feet 3 inches. He also entered for a prize of 100*l.* offered by the Scottish Art Union for outlines illustrative of events in the life of ROBERT BRUCE. MILLAIS lost the prize by one vote, but he was awarded an extra prize of 60*l.* In the same year he painted *Cymon and Iphigenia*, which might be taken for one of ETTY's works. There was an important architectural competition during the year for the Army and Navy Clubhouse. But after designs were selected the committee, although paying the premiums, refused to adopt any of them. A limited competition of six architects was afterwards arranged, and eventually Mr. S. SMIRKE designed the building in Pall Mall which recalls the library at Venice.

The British Museum in 1847 obtained the fragments from Boudroum which formed part of the Mausoleum. The Knights of Rhodes had used the slabs for repairing the walls of their fortifications. When they were first thrown down on the floor of the room containing the Phigaleian sculpture they were not appreciated, for they were supposed to represent works executed in a period of decadence, and the Greeks and Amazons who were shown fighting were condemned as too theatrical. But later studies have caused them to be valued much higher, and some of the figures are not unworthy of SCOPAS, who was employed with three other artists on the memorial. The arrangement of the Mausoleum has given rise to much speculation, and the remains are constantly sought out by visitors to the Museum.

Last week we printed the evidence of the President of the Royal Scottish Academy. It is confirmed by transactions in 1847. The Royal Institution at an earlier time claimed to be under the direction of men of such rank and station as to prevent the possibility of personal views being attributed to their management, while it was otherwise with the artists. In consequence the artists seceded, and the Royal Scottish Academy was founded in 1826. In 1847 the Academy received notice to quit from the Board of Manufactures and the Royal Institution, and it was declared that the exhibition of that year was to be the last held in the galleries. Afterwards Mr. SHAW LEFEVRE was sent down by the Government, and he recommended that provision ought to be made for the Scottish Academy and a building erected for the annual exhibitions. That was the origin of the twin-building which was divided between the Scottish Academy and the National Gallery, with the unfortunate results which the President lately described.

There are a few artists among us who were labouring in 1847. Mr. GEORGE AITCHISON, R.A., was represented in the Royal Academy by a "Design for a Sepulchre," and among the exhibitors were Mr. W. P. FRITH, Mr. J. C. HOOK and Mr. J. SANT. We hope they may long remain as chroniclers of that time.

The Council of the Royal Manchester Institution have arranged for a series of midday addresses on the pictures in the City Art Gallery. These addresses or descriptive lectures have been undertaken by Mr. J. Ernest Phythian, and are being delivered in the Exhibition Gallery, Mosley Street, by permission of the art gallery committee each Wednesday at 1.20 P.M., and last for half an hour only.

THE BISMARCK MEMORIAL, HAMBURG.

HEINE'S saying about the Germans having the dominion of the air, although it may seem to be contradicted by their success in worldly affairs, helps to explain many of their intellectual and artistic characteristics. By soaring above the earth there is not only a chance of respect for abstract truth, but notions of quantity cease to correspond with those of commonplace mortals. German æsthetics is not always applicable to realisation in sublunary materials or by men and women who insist on rewards in current coin. When attempts are made they generally display a tendency towards the colossal, as if paying tribute to the Infinite. This fact is peculiarly confirmed by the history of German sculpture.

In Mediæval times there was a remarkable correspondence between the architectural details and the carved figures and ornament. The proportions of the churches might not be altogether satisfactory if judged by architectural rules or compared with French or English examples. But in a great many important parts it seemed as if the carvers had got hold of the masons' work. The Flamboyant tracery is often wonderful, but we doubt if it could have originated with an architect. The visitor who stands in admiration before the pulpit in Strasburg Cathedral cannot help being amazed at the delicate details. But at the same time he must approve of the foresight which enclosed it with iron railings in order to prevent the carving from being touched by a finger or by feet ascending the stairs. The Sakramentshäuschen in Nuremberg, the tomb of St. SEBALDUS, and many other examples could be referred to which suggest that the spirit of the early carvers in ivory long prevailed in Germany. In those days, however, a homely mysticism prevailed there and abstractions were not much favoured.

In modern times, beginning with the nineteenth century, when the German spirit received an impetus from the heroic efforts against the Napoleonic armies, the sculpture seemed to become entirely emancipated from all trace of the Gothic spirit. In no art was the peculiarity of GOETHE'S "Faust" so strongly manifested, for as the Mediæval professor in the poem becomes enamoured of HELEN of Troy in her Spartan palace, so the German sculptors boldly sought to rival the Greek masters. The colossal bronze by which SCHWANTHALER represented *Bavaria* might be taken as one proof typical of the new spirit. Sometimes conditions which could not be disobeyed compelled the sculptors to adopt a small scale for their works. It is doubtful whether any one of the memorials of the Emperor WILLIAM and the war with France in 1870 affords as much enjoyment to foreigners as the memorial of FREDERICK THE GREAT in Berlin, with its attendant figures of eminent Prussians, which would now be considered simply as statuettes and not suggestive of the heroic. The space which that work had to occupy in the principal thoroughfare of Berlin was very limited, and RAUCH was obliged to make the best of it. But the sculptors who were commissioned to execute memorials of the latest triumphal war found that if space was not at first available it was provided, and in consequence all the groups of the Emperor and his lieutenants are of exceptional dimensions.

It is unnecessary to say that in the treatment of sculpture serious consideration should be given to the scale of the figures. It is not sufficient to make a perfect model on a small scale and then obtain an enlargement by processes which are more or less of a mechanical sort. Much as we admire German sculpture, we must own that all of the memorial groups we have seen have not impressed us in proportion to their size. A great many of them would undoubtedly appear more creditable to the creators if the scale could be reduced. No doubt works which have to be executed for private patrons must be comparatively small, and practice with them is unfavourable to that condition of mind and hand which can impart largeness of style to masses which must

be of large dimensions. In small works detail is allowable. But one of the conditions of grandeur consists in the omission of parts which under different circumstances are permissible. The works of the Egyptians and those of MICHEL ANGELO may be taken as examples of the operation of this law of sacrifice at very different times.

It is on account of the daring experiment by Herr HUGO LEDERER, the sculptor, and Herr EMIL SCHAUDT, the architect, that we refer to the Bismarck Memorial erected in Hamburg, of which an account has been published by Herr WASMUTH, of Berlin. The Iron Chancellor was not a friend of Great Britain, and we have no desire to glorify him. But art should be respected for art's sake, and there can be no question that the Hamburg Memorial testifies to the inventiveness, courage and scorn of conventionalities of the two artists who were its creators. It is a very big work, but that is not its sole characteristic, for from the foundation to the summit it is characterised by largeness, which is due not only to the design, but to the almost unique character of its construction.

We use the word construction deliberately, although it is not usually employed in describing sculpture. The Bismarck Memorial is simply a composition in granite,

and the figure of the Chancellor has been constructed in the same way as the masonry which supports it. The cloak, the armour, the sword and the eagles which flank the figure were laid in courses corresponding with those in the lower part, which would alone be considered as architectural. The horizontal and vertical lines of the joints are to be traced in both. BISMARCK's head and neck are cut out of one block and the legs and feet from another. But the rest of the figure could be described as construction in masonry. All this may appear strange to those acquainted only with sculpture on a small scale. But one of the ancient Egyptian priests, if he could visit Hamburg, would appreciate the arrangement and approve of it.

The material employed is granite, which is symbolic of the grim statesman, but of a variety which is more applicable to chiselling than any of those quarried in this country. The stone, wherever found, has its limitations in dressing. The Egyptians were aware of

the fact, as well as Herr LEDERER and Herr SCHAUDT. The bold but simple mouldings we see in the architectural part, and the ultra-Doric capitals of the columns, are signs of the right use of the material. But the massive unadorned armour, the heavy mantle which falls almost without a fold, and the broad treatment of the features, are further evidence. No less effective are the two guardian eagles with closed wings, in which not a feather has been indicated. Throughout it may be said there was not a superfluous stroke by the mason's hand.

In modelling BISMARCK the sculptor has avoided the ordinary practice. To represent him in his cabinet, or in the German Parliament, or in the uniform of a soldier who was without a command, would not be much of a feat. Nor would it be novel. But by placing him in a position as if he were to be accepted as the guardian spirit of Germany, the Chancellor was exalted, and the ideas of his admirers, and it may be of future generations, were realised. Although Prussia as a kingdom is not of ancient date, BISMARCK represented the Germanic spirit, and if its legends and stories are evidence, armed and faithful knights were at one time more prized in Germany than in other countries. BISMARCK, therefore, stands quietly leaning on a mighty two-handed sword, looking over the approaches to Hamburg as if he accepted the responsibility of a contest and was prepared to encounter enemies from abroad. The memorial stands on a small hill, and the stern and serious grey figure can for many a year recall the trials and the triumphs of the creator of modern Germany.

It is right to observe that the memorial is not completely finished. For a work which should have a sculptural character it may be considered that the statue is not sufficiently connected with the base, and that it ought to have been either placed nearer or fixed at a greater height. The objection will be removed. On the faces of the eight projecting pedestals single figures in relief and executed in granite will be placed. They represent nude warriors with well-developed muscles, and besides being ornamental they will suggest that BISMARCK's statecraft would have been unavailing if it were not for the strong men who formed the German armies. The spectators will thus learn that if they cannot all be chancellors, at least many of them can help to sustain the Empire in war and peace.

GREEK MYTHS.

OF late years a general agreement has been arrived at among most students of mythology, and this is that all mythological explanations must rest on a sound etymological basis. Comparative philology, after working a complete reform in the grammar and etymology of the classical languages, has supplied this new foundation for the proper study of classical mythology, and no explanation of any myth can henceforth be taken into account which is not based on an accurate analysis of the names of the principal actors. If we read in Greek mythology that Helios was the brother of Eos and Selene, this needs no commentary. Helios means the sun, Eos the dawn, Selene the moon, nor does it require any great stretch of poetical imagination to understand how these three heavenly apparitions came to be called brother and sisters. But if we read that Apollo loved Daphne, that Daphne fled before him and was changed into a laurel tree, we have here a myth before us which yields no sense till we know the original meaning of Apollo and Daphne. Now Apollo was a solar deity, and although comparative philologists have not yet succeeded in finding the true etymology of Apollo, no doubt can exist as to his original character. The name of Daphne, however, could not have been interpreted without the aid of comparative philology, and it is not till we know that Daphne was originally a name of the dawn that we begin to understand the meaning of the myth. It was by taking myths which were still half intelligible, like those of Apollo and Daphne, Selene and Endymion, Eos and Tithonos, that the first advance was made towards a right interpretation of

Greek and Roman legends. If we read that Pan was wooing Pitys, and that Boreas, jealous of Pan, cast Pitys from a rock, and that in her fall she was changed into a pine-tree, we need but walk with our eyes open along the cliffs of Bournemouth in order to see the meaning of that myth. Boreas is the Greek for north wind, Pitys for pine tree. But what is Pan? Clearly another deity representing the wind in its less destructive character. The same Pan

poet tells us that Pan, the wind, played with Syrinx, and that Syrinx was changed into a reed. The name of Pan is connected with the Sanscrit name for wind, namely, "pavana." The root from which it is derived means, in Sanscrit, to purify; and as from the root "dyu," to shine, we have in Greek "Zên," "Zênós," corresponding to a supposed Sanscrit derivative, "dyav-an," the bright god, we have from "pû," to purify, the Greek "Pân," "Pános," the

BISMARCK MEMORIAL, HAMBURG.

is called the lover of the nymph Echo, and of Syrinx. Why Pan, the wind, should be called the lover of Echo, requires no explanation. As to the nymph Syrinx—a name which means in Greek the shepherd's pipe—she is further fabled to have thrown herself into the river Ladon in order to escape from Pan, and to have been changed into a reed. Here mythology has simply inverted history; and while, in an account of the invention of musical instruments, we should probably be told that the wind whistling through the river reeds led to the invention of the shepherd's pipe, the

purifying or sweeping wind, strictly corresponding to a possible Sanscrit form "pav-an." If there was anywhere in Greece a seashore covered with pine forests, like the coast of Dorset, any Greek poet who had ears to hear the sweet and plaintive converse of the wind and the trembling pine trees, and eyes to see the havoc wrought by a fierce north-easter, would tell his children of the wonders of the forest, and of poor Pitys, the pine tree wooed by Pan, the gentle wind, and struck down by jealous Boreas, the north wind.

SELBY ABBEY.

A MEETING of the executive committee of the Selby Abbey Restoration Fund was held on Friday last at Selby, for the purpose of considering the tenders for the roofing and ceiling of the nave, north transept and Latham chapel, and for the outer roofing and oak groining of the choir. The tender of Mr. Ullathorne, of Selby, to carry out the works for 7,041*l.* was unanimously accepted. The meeting resolved that a time limit for the completion of the nave roofing should be arranged between the architect and the contractor so that the work may be pushed on speedily.

The meeting then considered an estimate for the rebuilding of the gable with east and west turrets of the north transept, which is to have a pitched roof in accordance with the original building. The meeting accepted Mr. Ullathorne's tender amounting to 798*l.* 15*s.* 10*d.*

Mr. J. O. Scott brought before the meeting the subject of underpinning the piers on which the abbey tower stood. He pointed out that the foundations had sunk very seriously, this having been going on ever since the abbey was built. It was resolved that the architect should proceed with this work at once.

The chairman of the finance committee reported that the total amount of the restoration fund was 31,810*l.*, of which sum 23,060*l.* was actually in the bank.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fifth general meeting (business) of the session was held on Monday, the 7th inst., Mr. Thomas E. Colcutt, president, in the chair.

The decease was announced of Henry Simpson Legg and Horace T. Bonner. A translation of a letter from M. H.-P. Nénot, president of the Central Society of French Architects, presenting to the Institute, on behalf of his Society, a gold medal in commemoration of the Seventh International Congress of Architects, was read. The thanks of the meeting were accorded the Society by acclamation.

The following candidates for membership were elected by show of hands under by-law 9:—*As Fellows*: Messrs. C. S. Spooner and T. H. Weston. *As Associates*: Messrs. M. J. Dawson and H. G. Leslie, F.S.I.

The following hon. corresponding members were elected *en bloc* by acclamation:—Robert Böker, member of the Imperial Society of Russian Architects (St. Petersburg); Louis Bonnier, president of the Société des Architectes diplômés par le Gouvernement Français, Architecte-en-Chef des Bâtiments Civils et Palais Nationaux; Frank Miles Day, president of the American Institute of Architects, Lecturer on Architecture at Harvard University (Philadelphia, U.S.A.); Jean-Joseph Caluwaers (Brussels); Mariano Eduardo Cannizzaro (Rome); Cass Gilbert, vice-president American Institute of Architects (New York, U.S.A.); Georges Harmand, Avocat à la Cour d'Appel, Paris, member of the Judicial Council of the Société Centrale des Architectes Français (Paris); Hermann Helmer, K.K. Oberbaurath (Vienna); Virgil Nagy, Building Councillor to the Kingdom of Hungary, Professor at the Hungarian Technical University (Budapest); Ludwig Neher (Frankfort-on-Main); George B. Post, Chevalier of the Légion d'Honneur (New York, U.S.A.); Jacques Maurice Poupinel, Architecte diplômé par le Gouvernement Français (Paris); Abraham Salm G.B.zn (Amsterdam); Ventura Terra (Lisbon); Don Fernando Arbós y Tremanti, member of the Spanish Academy of Fine Arts, Inspector-General of Works at the Ministry of Fine Arts, Madrid; Gustaf Wickman (Stockholm).

A motion by Mr. Herbert W. Wills with reference to the employment of public officials for public works of architecture being related to a subject discussed and voted upon by the Institute on December 3 last, it was declared contrary to precedent and out of order to bring what was practically the same question forward again after so brief an interval.

Mr. W. Woodward drew attention to the proposed conditions of competition for the new London county hall, with especial reference to the proposal to invite certain architects to submit designs in the final stage of the competition, and moved the following resolution:—"That this meeting is of opinion that all drawings for the competition for the London county hall, including the designs of the eight selected architects, be sent in on one and the same day. The meeting also decides that a copy of this resolution be forwarded by the secretary of the Institute to each of the architects who are members of the Institute, and that a similar copy be forwarded to the London County Council."

The following amendment was adopted instead:—"That the London County Council be invited to extend the time allotted to the two competitions to nine months, of which six shall be devoted to the first competition."

Mr. K. Gammell proposed the following resolutions:—
1. "That in view of the fact that limited competitions for public buildings erected with public moneys are a great injustice to the young and unknown members of the profession struggling for recognition, and also not in the best interests of the promoters, this Institute declares that such competitions should not be limited, and should take such steps as may be deemed advisable to discourage public bodies from instituting such competitions." 2. "That this Institute exert its influence in obtaining the abolition of the growing custom of penalising non-competing architects by retaining their deposit."

The meeting, on the motion of Mr. Herbert W. Wills, further resolved:—"That the assessor in a competition should refrain from any expression of doubt as to the relative merits of the designs placed in his award, such expression of doubt being calculated to weaken the effect of his award and to lead the promoters to override it, to the great detriment of the object aimed at, viz. the adoption of the best design."

THE LAKE VILLAGE, GLASTONBURY.

A POPULAR lecture was given by Mr. H. St. George Gray in the Taunton Museum on the early British lake village at Glastonbury. The exploration is being systematically extended by Mr. Arthur Bulleid, F.S.A., and Mr. Gray, on behalf of the Glastonbury excavation committee and the British Association. Nine-tenths of the area has now been explored.

Mr. Gray, having remarked that he was sorry to have to inform them on the highest authority, His Majesty's Office of Works, that the Government did not intend to buy Glastonbury Abbey, nor would it be acquired by the nation, at any rate through the instrumentality of the Government, said that in the early days there could have been but a small population in Somerset except on the bare uplands of Exmoor, Quantock and Mendip. For the rest, the centre of Somerset was then but a succession of vast marshy wastes, with the great forest of Selwood thrusting itself in from the eastern border. The story of the arrival of man and of the gradual evolution of culture in his history was, of course, an enormous subject, but they would allow him to point out that their museum contained a very fine provincial collection exemplifying the arts of the inhabitants of Somerset from the earliest times, and the natural history of the same area, while the further they went back into prehistoric times the better, perhaps, their collections were represented. Until recently, he said, the museum, and indeed many others, contained very few remains of the cultured epoch B.C. 250 to A.D. 50, now known as the prehistoric Iron Age or late Celtic period, and that was the age which covered the few centuries in which the Glastonbury lake village flourished. He did not, with any certainty, attribute the origin of the lake village to the Brythons, or to a people of mixed Iberic, Goidelic or Brythonic blood, it being more probable that the Belgæ (a partly Teutonic people), who appeared in Britain about B.C. 250, were responsible for the formation of the village. There was a tradition that a colony of Belgæ formerly occupied Glastonbury. Discoveries of lake dwellings in England were rare. Finds of that nature, but of minor importance, had been made in the meres of Norfolk, Suffolk, parts of the Fenland district, near Brecon, in London, and in Berks, and at some of the five stations in Holderness, Yorkshire. Of far greater importance than any of those was the discovery made in March 1892 by Mr. Arthur Bulleid, of the lake village situated one and a quarter miles north of Glastonbury, but in the parish of Meare, from which village it was two and a half miles distant in a bee line. Although the site was about fourteen miles from the coast it was less than 18 feet above mean sea level. The river Brue passed between high banks at no great distance away, and there was good reason to believe that the small natural watercourse which bounded the village at the east side represented the ancient course of the river Brue or a large tributary of it. Mr. Gray then described at some length and in a most interesting manner the formation of the village with its numerous huts, one of which was discovered in 1905. Although it only had two floors it had no fewer than nine superimposed hearths. At the time of the evacuation of the village the upper floors of the huts were at a considerably higher elevation than the

turf-clad mounds were now. Mr. Bulleid counted the sites of sixty-five dwellings at the beginning of the excavations in 1892, but up to last season eighty-three had been recorded. Without considering pottery, the relics found numbered some 4,000, and their interest was considerable, throwing a light, as they did, on the everyday life of the inhabitants. The relics were found, for the most part, on the various floors of the hut and oftentimes broken. In some huts everything of interest was found in a calcined condition, and for this and for other reasons they had been able to determine that they were burnt down. The objects of utility and ornament had been found to consist of bone, wood, shale, jet, amber, bronze, lead, tin, iron, antimony, glass, baked clay, flint and other stone. Amongst the most attractive objects were the weaving-combs, which numbered about 100, and even more numerous were the spindle whorls with which the women twisted their thread. Many shuttle-spools of bone had been found and numbers of loom weights to keep the warp tight on the loom whilst the weft was being worked in with bone shuttles. They had found a loom, or at least the framework of one. Many bone needles had been discovered, but bronze ones were rarer. Mr. Gray next dealt with relics of personal ornament which had been found, and said the most remarkable amulet was a roundel fashioned out of a human skull bone. He also referred to the famous bronze bowl found in the village in 1893. That metallurgy was carried on they were positive from the fact that many crucibles had been found and also the remains of two tuyères—conical tubes through which air was conducted into a furnace by means of bellows. Pieces of glass slag had been discovered, implying that glass-working was also practised. Small furnaces, perhaps used in that connection, had been found. Of the iron objects discovered none surpassed in general interest those which had generally been proved by Mr. Reginald Smith to be currency bars, as a means of barter. In some instances in England they had been found in bundles, in one case no fewer than 394 being discovered in one camp. Evidence of games was not wanting in the village, and cereals and other vegetable products and seeds had been found plentifully. Of human remains many had been found, including a skull with sword cuts in it. There was a slight suspicion of infanticide, judging from the numerous remains of infants found in the huts. On the other hand, it must be borne in mind that the ordinary death rate, especially of children, must have been great in a habitation that was partially flooded. Animal remains were exceedingly plentiful, and several remarkable wooden objects had been recovered. They might infer that these lake villagers were not only farmers and herdsmen, but were advanced in the technical arts. In conclusion, Mr. Gray trusted that he had convinced those present that Somerset had produced the most famous example of late Celtic domestic civilisation in England if not in the world.

SHEFFIELD SOCIETY OF ARCHITECTS.

THE architectural treatment of woodwork formed the subject of a lecture at the last meeting of the Sheffield Society of Architects and Surveyors, by Mr. H. L. Paterson. After a reference to the growth of trees and the nature of wood used for building purposes, the history of architectural design in this material from the earliest times was outlined. The introduction of stone as a building material where only wood had previously been used was considered, and it was shown that, while in some countries the latter material was abandoned, in others it was developed simultaneously with the stone, and modified the design of the buildings. The abandonment of wood for domestic buildings in France in the twelfth century was due to the destructive fires accompanying the constant warfare; but, as Viollet-le-Duc has shown, two centuries later recourse was had once more to wood in order to build as rapidly and economically as possible the great commercial cities springing up in the north and centre of France. The same style of building was characteristic of our own cities, and it was not until the seventeenth century that wood as a building material was virtually abandoned in England. With regard to the wooden roof, the lecturer showed that this feature attained in England its noblest development, and was used in buildings of a monumental character long after it had been abandoned on the Continent. Mr. Paterson dealt with the design of internal ecclesiastical and domestic woodwork from the thirteenth century, through the Early Renaissance period, and down to Grinling Gibbons's work in St. Paul's Cathedral, which may be regarded as the culminating work of the later

Renaissance. The difference in the nature of the carving was emphasised, and it was shown that in the later work the ornament was no longer cut out of the mouldings, but out of separate pieces which were applied to the work, allowing greater freedom in design and greater delicacy in execution, but to a certain extent interfering with the architectural lines. The paper concluded with a plea for the correct use of woodwork, and Mr. Paterson's opinion was that, while it might be losing ground as a constructive material, there was little reason, owing to its intrinsic beauty, to fear that wood would be supplanted for internal decorative work. A large number of slides of English woodwork were employed.

PEVENSEY CASTLE.

THE interest of all antiquarians and historians is aroused in connection with the excavations which are in progress at Pevensey Castle, which is known to be the centre of a Roman camp. The ancient castle is the property of the Duke of Devonshire, who has considerably allowed a specially appointed committee to arrange a thorough course of investigation into the mysteries which lie hidden beneath the soil of the courtyard and within the ruined walls of the castle. About fifty-three years ago excavations were commenced, says the *Sussex Daily News*, but were quickly abandoned in consequence of lack of funds, and it is to be hoped that the committee who have the present work in hand will receive the necessary financial encouragement to enable them to complete their important undertaking. The committee comprises Mr. W. Page, F.S.A., and Mr. C. R. Peers, F.S.A. (editor of the "Victorian History"), Mr. H. Sands, F.S.A., Mr. L. F. Saltzmann and Mr. J. E. Ray; and has the valued assistance of Dr. Haverfield and Mr. Fox. The list of subscribers towards the expense of the scheme includes many well-known personages, prominent among the names being that of the Duke of Norfolk. A visit to the castle, situated in close proximity to the peacefully reposing ancient church, quickly reveals to the visitor the work which is being carried out, the courtyard presenting striking evidence of the temporary excavation by the labourers' pick and shovel.

Work was commenced in the second week of last October, and has been principally under the supervision of Mr. J. E. Ray, of Bexhill, and Mr. L. F. Saltzmann, of Hailsham, who visit the ruins several times during each week. No startling revelations have transpired up to the present, and the expectations of some of the promoters of the excavations have not been realised. The workmen began operations in the vicinity of the old postern stone gateway on the north side of the grounds, which was discovered during the excavations about half a century ago. It was formerly covered by a large archway and led into the main road. The accumulation of years practically buried the gateway from view. The workmen have dug down to the huge foundation, and four substantial oak staves which acted as supports have been disclosed. In another spot there was a very big settlement, which was the cause of the sinking of the foundations and the splitting of the huge wall. Deep trenches have been dug in the hopes of discovering the remains of Roman buildings, acting on the supposition that beneath the grounds of the castle once existed a village. This theory is upset by the quantity of nails found, leading one to surmise that the erections were of wood and were removed when the Romans deserted the place. Even if brick buildings had been erected and demolished by the Romans before departing, some trace must have been found in the accumulation of the walls or foundations. The operations, however, have yielded a large quantity of Roman and Samian relics such as coins, pottery utensils and old iron instruments. Among the curios is a very large "bit" iron belonging to a horse, and parts of millstones with which to grind the corn.

The relics, which would fill a builder's cart, have been transferred to the old town hall before being despatched to London, and in all probability they will be placed on exhibition to help to defray the cost of excavation. Perhaps the most interesting of the relics is an almost perfect specimen of a coin bearing the image of Constantine; but nothing of a specially important character has been unearthed.

The excavations as far as the courtyard is concerned are practically terminated, and it only remains for the trenches to be filled in. The workmen are awaiting instructions concerning their next occupation, and it is probable that the keep in the castle will be explored, it is hoped with more gratifying results.

NOTES AND COMMENTS.

THE Northampton Town Council, having received the promise of a grant from Mr. CARNEGIE, resolved to erect a library from the designs of the borough engineer. We offered some remarks upon the proposals, explaining their ineligibility. The subject has caused much discussion in Northampton, and finally the libraries committee have endeavoured to meet the difficulty by a modified arrangement. It was proposed to obtain the designs in open competition, and that an assessor should be nominated by the President of the Royal Institute of British Architects, his fee being 50*l*. The successful architect would be paid an inclusive fee or commission of 500*l*. for his plans, specifications, designs for furnishing so far as required, and services of supervision in connection with the erection and completion of the building, and the second and third competitors receive a premium of 50*l*. and 25*l*. respectively. Should an architect practising outside the borough prove successful in the competition there would be no allowance, in addition to the 500*l*., for travelling or other incidental expenses. As Mr. CARNEGIE offered 15,000*l*. it will be observed that the sum proposed to be paid is below the usual percentage. The recommendation was not adopted by the Town Council, as by a majority of one vote it was resolved to send back the subject for further consideration.

THE selection of names of representative men for engraving on libraries and other institutions is sometimes difficult, owing to the numbers which can be employed. Some American papers are recalling the method employed by Messrs. McKIM, MEAD & WHITE for the Boston Public Library. Taking a suggestion from the acrostic, they made the names of the member serve as a guide. "McKIM" was in that way represented by MOSES, CICERO, KALIDASA, ISOCRATES and MILTON. "MEAD" was expressed by MOZART, EUCLID, ÆSCHYLUS and DANTE. The unfortunate STANFORD WHITE suggested WREN, HERRICK, IRVING, TITIAN and ERASMUS. All the names were satisfactory, although some citizens might not be aware until they inquired that KALIDASA was the greatest of Indian poets. But the principle adopted became known, and scholars could hardly approve of what was so simple, especially as the great names of HOMER, VIRGIL and SHAKESPEARE were ignored. The names inscribed on the building were accordingly selected by a more systematic process.

ILLUSTRATIONS.

THE NEW WAR OFFICE, WHITEHALL.—QUADRANGLE.

MANCHESTER ROYAL INFIRMARY.

CATHEDRAL SERIES.—CARLISLE: REMAINS OF NORMAN NAVE.

DESIGN FOR NEW NATIONAL GALLERY ON THE CALTON HILL, EDINBURGH.—VIEW FROM THE SOUTH-WEST.

THE design we publish was prepared by Mr. GEORGE SHAW AITKEN, architect, of Edinburgh, at the suggestion of Professor PATRICK GEDDES. The idea was that a new gallery might be erected on the Calton Hill immediately above and grouping with the High School, a remarkably fine work by THOMAS HAMILTON. The gallery would be approached from the west side by spacious flights of steps or by an incline. The plan is cathedral-like, with nave and aisles and centre transepts. The galleries would be top-lighted. The pictures could be arranged according to periods and schools, special places being allotted to large and important works.

WREXHAM PUBLIC LIBRARY.

THE design for this library was placed first in competition with over 100 others in April 1905 by Mr. W. E. WILLINK, M.A., of Liverpool. The building is now practically completed. The materials used

are Cefn stone and red pressed facing bricks. The front roof is covered with Westmoreland slates and the back roof with Bangor slates. The interior is treated simply, suitable to the purpose of the building. The contractor is Mr. R. ROWLEY, of Gresford, near Wrexham. The heating has been carried out on the low-pressure system by Messrs. DARGUE, GRIFFITHS & Co., of Liverpool; the electric lighting by the Triplex Company, of Wrexham; the metal casements were supplied by Messrs. BURT & POTTS, of Westminster; and the wrought-iron entrance gates were made by Messrs. HARDMAN, POWELL & Co., of London and Birmingham.

FIRST FLOOR PLAN

*Vernon Hodge
Jeddington*

GROUND FLOOR PLAN

The carving was executed by Mr. BOSKER, of Wrexham. COTGREAVE'S indicators are being used. The amount of the accepted tender was 3,504*l*., the stipulated cost for the building complete (exclusive of furniture) being 3,500*l*. The library is a gift of Mr. ANDREW CARNEGIE. The architect is Mr. VERNON HODGE.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at Tufton Street, Westminster, Mr. Walter Cave, vice-president, in the chair.

Mr. E. L. Hunot was elected a member.

The CHAIRMAN announced the award of a prize, valued at three guineas, to Mr. Francis R. Taylor, for the examples he had submitted in connection with the Architectural Association Photographic Competition.

Mr. TEMPLE MOORE read the following paper on

The Arrangement and Design of Modern Churches.

In selecting this subject for my paper I am afraid there is little that I can say that has not already been said by others. Still, though I do not hope to be able to tell you anything very fresh, I trust that some points I touch upon may prove of some use to our students.

In speaking of the arrangement and design of modern English churches, I am assuming that such a building is in the Gothic manner; for whatever may be the merits of revived modern British Classic, which appears for the present to hold the field so far as civil architecture is concerned, I trust that we are not likely to return to more or less skilfully applied arrangements of the Five Orders for our ecclesiastical buildings.

For one reason, whatever may be the case with our civil buildings, the strictest economy is in most instances a necessity in the ordinary course of modern church building, consistent with a substantial structure, and I believe that well understood Gothic may be so handled that a good architectural effect can be produced in the simplest way, without having to depend on applied architectural ornaments.

Of course, I do not mean to say that the style in which a building may be designed has anything to do with its suitability or convenience, which is entirely a matter of planning and general arrangement; but, on the other hand, one often hears it asserted that such and such a style is quite unsuited to modern requirements, as if the sections of the base moulds or the door and window jambs could in any way affect the convenience or suitability of the building. It is no doubt true that the ordinary modern church possesses as a rule very little of either beauty or interest, and is also often far from satisfactory in general arrangement. I think that the cause of this has often been that the designers of these buildings have had little first-hand knowledge of the proper treatment of their subject, and possibly have taken little interest or pains in the matter, so that it is not fair to lay these failures at the door of the style nor to suppose that had all the caps been Corinthian or Doric the buildings in question would have been one whit better than they are.

The common type of modern church, with a nave divided into comparatively narrow bays with low lean-to aisles, a clerestory with a very high-pitched main open roof, a chancel generally lower than the nave, and divided from it by a heavy chancel arch, with the end of one aisle filled up by a vestry, and the other by an organ chamber, on either side of the chancel, is probably as unsuitable a type as could have been selected for a large congregation. It has been repeated over and over again during the last forty years, and though one now frequently sees departures from it in the better modern work, it is still a type far too prevalent.

How such a plan came to be so general I cannot say. I suppose it has a certain element of cheapness, and somehow got recognised as the correct thing for a church. It is curious that the elder Pugin, who was practically the pioneer in Revived Gothic, generally avoided this defective plan, and it is interesting to cite his churches at Birmingham and Derby, as well as St. George's, Southwark, as excellent examples of planning, suitable to modern requirements.

In speaking of the arrangement of a modern church, let us take the average size of a building suitable to a modern town parish, a building capable of accommodating, say, 600 to 900 people. Some people think that a mistake has been made in multiplying comparatively small parishes, and that it would have been better policy to have built larger churches to serve more extensive areas. Though doubtless such a system would have some advantages, we have to consider things as they are. Taking, then, a church of the above average size as a standard, the first question that should be always considered in laying down the plan is the site.

As a general rule, the sites available in the suburbs of modern English towns have not much to recommend them

in the way of picturesqueness, but however dull they may be, there is generally some peculiarity which should influence the design of the building to be placed upon them. One of the greatest faults in modern work is that this question of the site is not nearly so carefully considered as it should be. This is certainly the case in a great deal of modern church building, and is also true to a certain extent in other branches of modern architecture, buildings looking when they are finished as if they had nothing to do with the place they happen to be in.

Generally, the plan of such a church as I am speaking of will probably resolve itself into a nave with aisles on either side, and I consider that this is often the best plan to be adopted; but it is important to remember that in a church where practically the whole of the space, excepting the choir, is to be occupied by the congregation, that it is well to make the aisles, and the arches separating them from the central nave, as wide and spacious as possible. This makes the building, as much as can be, a single whole internally, and will not make it like two or three buildings placed side by side. It is also important to carry the aisles eastward, beyond the commencement of the chancel, to at least within one bay of the east end; as this opens the whole of the choir to the nave and aisles. A plan on these lines looks, of course, very square on paper, but this is by no means a defect from a practical point of view, as the congregation are more together than in a long and narrow building.

I mentioned that I consider the bays of the arcades should, in my opinion, be kept fairly wide, and I think that the advantage of this is that a few large pillars do not cut up the interior of the building in the same degree as a greater number of smaller ones do.

You must remember that in most old churches where the aisles are divided from the central nave by comparatively speaking narrow bays, the aisles were little used for a general congregation, which was principally accommodated in the central part.

It is, of course, impossible as a rule under present conditions to lavish space in this way, when for reasons of economy every foot has to be considered.

In the English Church the surpliced choir, though often much abused, has practically become a fixed institution, and this being so, it is of the greatest importance that proper and ample space should be provided for it. This, unfortunately—generally, I suppose, from motives of economy—is rarely done in an efficient manner, and churches are disfigured by filling the choir with rows of what are really nothing but pews placed lengthwise, and with quite an insufficient central space between the front desks. There should, of course, be not more than two rows of stalls on either side of the chancel, and the longer the rows are the better the effect.

With regard to the sanctuary, here again it is of the utmost importance to provide ample space, especially in length, as without this no dignity of effect can be obtained. Steps should be kept low and broad, and arranged as far as possible in groups, so as to give wide platforms in front of the altar and between the communion-rail and the stalls.

A few years ago it was the fashion to very much exaggerate the elevation of the choir and altar; and latterly the tendency has been rather to the other extreme. I think myself that for a church such as I am speaking of an elevation of seven or eight steps from the nave up to the altar would be quite sufficient.

The organ is another important consideration; the modern instrument, as a rule, has become so large that it is often a great difficulty to provide for it. It is fatal to the internal effect of the building to block up the end of one of the choir aisles with the organ. Probably a chamber projecting from the aisles is, generally speaking, the best plan, but it is essential that there should be plenty of height, and that the front should be as open as possible. Sometimes it is possible to arrange for the organ over the vestries, and where this is practicable it is probably as good a plan as any.

The rules laid down by the Ecclesiastical Commissioners and the Incorporated Church Building Society are, of course, useful as a guide for the spacing of seats, widths of passages, &c. These rules lay down quite the minimum space which should be allowed for these purposes, and in my opinion rather more space should, where possible, be allowed.

With regard to towers and spires, these are probably in most cases better omitted in a town church, unless there is some prospect of enough money to build them of sufficient

size without stinting the rest of the building. The poor little spire which one sometimes sees, with its top not very much higher than a neighbouring warehouse or gin palace, is not an object worth spending money on. With regard to the position of the tower, the centre of the west end is no doubt, generally speaking, the right place; but frequently the exigencies of the site, especially in a town, render a departure from this very good general rule desirable. Regarding doorways, you must remember that most urban by-laws have now stringent regulations which affect the design of these features, and in most cases make a departure from the traditional treatment absolutely necessary.

To return for a moment to the question of a general plan. You must not suppose that I think a central nave with side aisles is the only right arrangement; this is a point that should, to a great extent, be governed by the nature of the site.

Where this happens to be a long and narrow site, probably a single span, with comparatively narrow side aisles or passage ways, is the best solution; but it must be remembered that a building of this type requires considerable height to the wall-plate in proportion to the clear width if a good internal effect is to be obtained. A proportion something after the manner of a covered railway station is certain to be unsatisfactory.

Another very simple and practical plan which might be much more frequently adopted than it is, especially where economy has to be considered, is a nave and chancel of fair width, with an aisle on one side only, of about the same width and height. The seventeenth-century church of St. John's, Leeds, is a good example (though wanting in internal height) of how well a church of this type may look.

There are, however, many ways by which a more or less difficult or irregular site may be successfully covered while keeping in view the necessity for a spacious and open interior. Many suggestive examples of planning of this type may be found in the old towns of Germany and Belgium as well as in France, where the churches have had to be fitted on to confined sites.

In this country our old churches generally stand surrounded by churchyards, and the type of treatment I am speaking of is therefore comparatively rare here. The beautiful and interesting old church of St. Crux, York, barbarously pulled down some twenty-five years ago, was however, if I remember rightly, a good example of it. This question of planning is one that hardly too much care and attention can be given to if a satisfactory result is to be expected. However simple the plan may be the success or otherwise of the building depends upon it, quite as much from the æsthetic point of view as from the practical. Far too little attention is, in my opinion, given by students and others to the study of the plans of our old churches. One is far too apt to be content with making pretty little sketches of details and parts, and neglecting the main dimensions of an old building.

Having settled the main lines of the general plan, the next question is the section, and this again is a matter that is largely governed by the question of cost. Generally speaking, the higher in reason the wall-plate can be the finer will be the effect internally.

I do not think myself that much internal effect is gained by a very high-pitched open roof, which is also likely to have practical disadvantages, both acoustically and for purposes of warming and ventilation. The real proportion of the building is practically settled by the height of the walls, though the proportion may be completed, so to speak, by the total height of the highest point of the internal ceiling, which may be of barrel or other form. Of course, there is no internal roof for a Gothic building equal to a stone or brick-groined vault, but this is a very expensive method, and I am rather confining myself at present to what may be done in ordinary cases.

Where only a moderate height to the wall-plate is possible it is, I think, better not to attempt a clerestory, but to carry the nave arcades up to the full height. If the aisle or aisles are of about the same width as the nave they can be similarly roofed, and the aisle walls in this case being the same height as the nave the side windows can be kept well up so as to thoroughly light the interior.

This is a style of church very common, as you know, in the west country, though as a rule they are too low in their proportion. There are, however, some exceptions, such as the church at Dartmouth, which is a very good example of this class. This section of church is also common in Germany, where it is often seen carried out on a grand scale with vaulted roofs. Where your plan is arranged for

narrower aisles than the type I have been describing, these may be roofed with flat or lean-to roofs; but in this latter case it will be generally found advisable to increase the height of the nave wall-plate, as otherwise the aisle walls will be too low to allow of sufficient elevation being given to the windows, the result being that the interior will be badly lighted. This is a defect in this particular type which has to be guarded against. Where, however, you can get a height of 25 to 30 feet to the aisle wall-plate and about 35 feet to the nave wall-plate, the difficulty I have mentioned will not occur, and you will have sufficient height in the nave to have a really stately arcade. Of course, the lighting from a clerestory which is at all well designed is always very fine; but it should be remembered that the building being intended to be used altogether, the effect of the interior should be a spacious whole; this effect will be lost if the arcades are robbed for the sake of the clerestory, and the aisles thus become, as it were, subsidiary buildings to the nave. This is a perfectly right and proper treatment in certain cases, but not one to be aimed at in a building that should, I consider, be designed to be used as a whole.

As a rule it is better in a modern church, such as I am speaking of, to omit the chancel arch altogether, and to carry the building at one height through from end to end, because the large piers of the chancel arch tend to obstruct the view from the aisles into the choir, though there are cases where a building has to be carried out in sections where the structural division between the nave and choir may be highly desirable. Of course this feature is the general rule in our ancient parish churches, though there are plenty of exceptions to it, such as St. Peter Mancroft, Norwich, and many others. It is also to be remembered, as regards the chancel arch, that its upper part was very often practically entirely covered by the great rood-loft and rood, with the space behind the rood filled in with boarding, on which was generally a painting of the Last Judgment. This, no doubt, would have a very fine architectural effect, but it is one that is rarely possible under modern conditions.

Where a chancel arch is introduced, I feel myself that the choir wants to be of very considerable length; the ordinary modern custom of making it equal in length to two bays of the nave, and separated from the latter by an arch, never to my mind can give a satisfactory architectural result, and only unnecessarily cuts up and confuses the interior. If you look at the plan of almost any old English parish church, you will nearly always be struck by the great length of the eastern limb, and this is an essential feature to the good architectural effect of what is with us the more common type of a Mediæval church. This, however, is not the type which in my opinion is the most suitable to our present requirements, and is shorn of its beauty of proportion when the eastern limb is, in the usual modern way, cut down to about half its proper length. As to windows, the question is rather a difficult one in the present day, when as a rule it is not easy to get them filled with good stained glass. The most part of modern stained glasswork is certainly not worth providing extra large windows for, and it is seldom that one sees large windows filled in a really satisfactory manner, even by the best modern glass. On the other hand, it is a great mistake to under window a building, as a gloomy interior in this climate is generally very unattractive and depressing.

The great point, I think, is to keep the side windows as high up as possible in the walls, and this, of course, is the advantage of a clerestory; but where the clerestory is lacking a fine effect may be obtained by the proper arrangement of the west windows. The effect of the light coming in from a good height in the west wall has often as good a result as that from the clerestory.

The arrangement of the east window or windows is a matter which may be so much varied according to the general design of the building that it is hardly possible to lay down any general rule on the subject. The large east window traditional to English Gothic work is a splendid thing when well designed, but it is certainly not satisfactory without its stained glass. This is rarely now put in when a church is built, with the result that the effect possibly of a really well designed window can often hardly be seen on account of the glare through the white glass.

On the other hand, the east wall, which is, of course, the most conspicuous internal feature of the church, requires a good deal of breaking up, and I think that a grouping of windows with large piers between them would often give a better result than one very large window, especially where the stained glass has to be left to the future.

The proportion and detail of the piers and arches is another matter of the greatest importance. More may be done by fine ample proportions and good simple mouldings than by a quantity of carving and ornament, and in this case, as well as with other features of the building, careful and continual study of our good ancient examples is, I believe, absolutely essential if satisfactorily designed modern work is to be produced. You cannot expect to be able to make up a successful Gothic building from plates in some particular book on ecclesiastical architecture; valuable as many of these are, the old examples must be studied first-hand.

A chapel with a second altar is a very usual feature in modern churches, and where properly managed adds much to the interest of the interior. It is generally placed on one side of the choir as a sort of pendant to the vestry and organ chamber, but I do not consider that this always is the best or only position possible. Where there is sufficient length in the site, the chapel might very well be placed to the east of the end of the choir; this would have the advantage of adding to the apparent length of the building, and the effect of the high altar is always more dignified if it is not placed immediately against the end wall of the church.

The chapel or chapels should, however, properly speaking, be always enclosed with suitable screenwork.

We have so far been considering the plans and sections of a building mainly as affecting the interior.

With regard to the exterior, I think it will generally be found that where the plan and sections have been carefully thought out the external elevations will, as a rule, come into shape without any great difficulty. I am certain that it is a mistake, generally speaking, to start with some fixed notion as to the external appearance and then try to fit the interior to it.

A building in the Gothic manner should, if it is to be successful, be designed from the inside outwards, and here I may point out that such very usual features as buttresses in a Gothic church are, properly speaking, part of the construction, and should not be introduced merely for the sake of dividing up the wall spaces, and making the drawings look a little more busy and interesting.

Well designed buttresses, where they are required structurally, are, of course, one of the finest features of Gothic work; but they must not be used as the pilasters in a Classic front, merely as ornaments. I think it well to remind you of this very obvious distinction, as one frequently hears the remark made in criticising a set of plans, "Would not such and such a wall be improved by being 'broken up' by some buttresses, quite irrespective of the structural necessity or otherwise of these features?"

A good outline is of far greater importance to a building externally than any amount of ornamental detail, and it is a frequent fault with modern work that it is often overloaded with trivial detail, which, though it may make a set of drawings look more attractive, has only a harmful result when carried out in actual work. A good, well-proportioned building may very possibly be greatly improved by well-designed and suitable detail and enrichment; but no amount of either of these latter will conceal a bad design. Many people do not realise the fact that a building is never seen in the way that it is shown on architectural elevations and sections, and with the view of making these latter attractive looking features are often put in that the actual building would be better without. Good Gothic does not consist in the endless multiplication of cusps and pateræ or monograms, charming as these ornaments may be when judiciously used. A great deal also depends on the proper use of materials. A good design may easily be reduced to a very dull level in actual work if the modern method of having every stone exactly the same colour and size, and every brick the same colour and so on, is followed. It is extraordinary how difficult it often is to get workmen and others to understand this, and I suppose it will take years to eradicate the traditions of Portland cement stucco.

It has often seemed to me that the apparent ideal of modern stonework is to try and make it look as like as possible to the Portland or Roman cement imitations of stone forty or fifty years ago. This also applies to other trades where, for instance, it is most difficult to get men who should know how to carry out Gothic oakwork properly. They cannot forbear the use of sandpaper and glue unless they are most carefully watched.

Having dealt so far with the general structure of the building, I will say a few words in conclusion as to its internal fittings and furniture. These, of course, are of great importance to the successful completion. Unfortu-

nately it often happens that gifts are made of fittings and furniture, of metal, woodwork, &c., bought ready made from the ecclesiastical furniture shops, and these things, as a rule, are of the very worst and poorest description, and in design and artistic workmanship. It is not, however, fair to overlook the fact that furniture and accessories such as I am speaking of, which have been specially designed, are often little better so far as their architectural character is concerned than the ready-made article, and this is no doubt due to the lack of proper knowledge of old work on the part of those who have designed them. No opportunity should be missed of carefully studying any of the fittings of an old church that still remain. Unfortunately, so much has been destroyed in this country that this class of work is comparatively scarce. Still, however, there is a good deal left, and it is always, I think, advisable to take careful note of the more simple examples, especially as these are far more likely to be useful under the generally straitened conditions which influence the fitting up of a modern church. So much modern work so obviously looks as if it had been founded on some old design of a very much more sumptuous character, and had been thinned and skinned down to meet the available price. It is usual enough, for instance, to see modern stallwork and such like covered with tracery and carving, and done in the thinnest possible wood. Work of this character cannot look well, while a quite satisfactory effect could have been got by reducing the amount of detail to a minimum, and keeping the material to the proper size.

In old work even it is by no means the rule that the most elaborate designs are the best—the reverse of this is very frequently the case.

These remarks as to woodwork may to some extent equally apply to metalwork. There has been the same tendency to disguise ill-designed form with a superfluity of detail. Latterly one has noticed a certain reaction against this, where practically the detail is left out altogether, without, however, obtaining a particularly successful result.

Enumerating briefly the most important fittings of the interior of the church, taking first the altar, it is important that this should be of ample size and properly proportioned, and that it should not, speaking generally, be overshadowed by its ornaments and surroundings.

I think myself that the reredos, for instance, is a feature that is often very greatly overdone. Splendid as our old wall reredoses are, even they, I consider, rather tend to overpower the altar they were intended to adorn, and this defect is even more pronounced in some modern work. The triptychs of the late Flemish or German Gothic type, charming as they are in their own surroundings, are as a rule not a very suitable type of altar-piece for our English churches, their proportions being generally too tall for our buildings. As there is practically very little work of this class left in this country, even in a mutilated state, it is necessary often to look abroad for models. I think more suitable types of altar-pieces for our buildings are to be found in France, or among examples of Italian Gothic, though these latter especially require to be entirely translated in their detail for our purposes. The eastern light should, I think, always be visible from the body of the church below the traceried heads of the bays of the chancel screen.

The plan of omitting the east window altogether and filling the whole end of the church with the reredos is not to be recommended, except, of course, where there are practical difficulties with regard to light. I need hardly say that, whether the reredos is of wood or stone, it should be as a general rule richly gilt and coloured. Of course the altar-piece may be entirely treated with hangings, and where this is properly done probably there is no more suitable or dignified treatment. An exaggerated dossal, however, with its narrow tester, looking rather like a portion of a very big bed, is to my mind to be avoided, and a superfluity of upholstery is undesirable. Where the chancel can be of considerable length, there is no doubt that a high rood-screen is the greatest possible ornament to the interior, but I think it requires very considerable depth behind it to give it its true value. It is curious, however, the prejudice one frequently meets against a screen. It is certainly not the case that a properly designed oak rood-screen of the type suitable to a parish church obstructs any necessary view, though many people seem to think so. This is sometimes avoided by the use of iron, but I do not think that iron screenwork ever looks quite satisfactory with our English work, and certainly the modern examples one sees are rarely successful.

The font should stand in the western part of the nave, preferably in the centre near to the western doors. As a rule the font is not now generally given at all a sufficiently prominent position. It should always have a cover, however simple, and this latter feature may be, as you know, very beautifully treated.

The pulpit is another important piece of furniture, which should be carefully designed, and I think that as a rule wood is preferable to stone. It requires carefully proportioning as to height in accordance with the size of the building, and may often with advantage have a sounding-board or canopy. The front of the organ (it is hardly correct now to speak of an organ case where the instrument is frequently as big as a cottage) facing the church or chancel can be made to look very well if skilfully treated. There are unfortunately no Gothic examples left in England (there is but one in Wales), though there are some very good seventeenth-century ones. The illustrations in Hill's book on the organ give a number of Gothic examples from abroad, many of which are most suggestive. The introduction of electric light has made the treatment of this very important modern requirement much easier than in the days of gas, one of the chief advantages being that a great deal of dirt will be avoided, and may make possible a more frequent use of coloured wall decoration; and if this could take the form of simple figure subjects, painted in distemper on the walls, such as one finds traces of in almost every old church, I believe it would add greatly to the interest of the interior, judiciously introduced and designed and executed on the right lines.

I think I have now kept you long enough wandering in and about this imaginary church. My old friend and master, the late George Gilbert Scott, used to say that it was of the utmost importance that you should walk about a building before you drew it, and taken with a careful study of ancient examples, I do not think this advice can be much improved on.

Mr. G. H. FELLOWES PRYNNE, in proposing a vote of thanks to the author of the paper, said there were few men better able to speak on the subject than Mr. Temple Moore. The speaker agreed with most of the views expressed in the paper, and especially the first proposition suggesting that proportion in church architecture was essential to good design. It was the one thing to be aimed at, he said, and of far greater importance than detail. In modern work, when nearly all architects were more or less compelled to design their churches to be built for very limited means, it was a great pity that money should be frittered away in rather poor detail. Under such conditions the beauty of a church must rest in its proportions, for even when sculptured ornament could be introduced it would not be quite in the same line as that of earlier examples, because the spirit of the work was not the same as that which encouraged the old carvers. But one idea should be there, and that was an aim at proportion rather than inferior detail. Another terse remark in the paper, said Mr. Prynne, was the designing of the church from the inside outwards. Although they would wish to make their churches picturesque on the outside, yet they must remember that the use of a church was internal, and the more effect obtained in the interior the better was the design. Mr. Moore knew, said the speaker, as well as most church architects, the impediments they found in carrying out their own wishes, and the difficulties of getting chancels enclosed by screens. Dioceses had different rules and faculties and they were not consistent, and architects consequently often had to suffer through the fads of chancellors of different dioceses. Another point in the paper was the choir, and Mr. Prynne said he did not quite agree with the view that two rows of stalls on either side of the chancel were enough, and he suggested that three rows on either side was better musically. In conclusion, the speaker wished that younger architects and students would do as older members of the profession had done in the past, and try to study ancient churches more as a whole. It was interesting to make sketches of important details, but it was profitable study to take the proportion of the parts and understand the rules which governed the whole building.

Mr. F. HOOPER seconded the vote of thanks, which was supported by MESSRS. LEONARD WILLIAMS, J. E. NEWBERRY and W. MILLARD.

Mr. J. B. Carter has been appointed director of the American Archaeological Institute in Rome, in place of Mr. Norton. Mr. Carter was formerly professor at Princeton University, and translated Professor Hülsen's book on the Forum. He has resided in Rome for two years.

THE PRACTICE OF ARCHITECTURE IN OUR SMALLER CITIES AND TOWNS.*

THE practice of architecture in our large provincial centres, such as Manchester, Liverpool, Glasgow, Leeds and others of similar dimensions, is carried on under conditions closely allied to those existing in the Metropolis. Firstly, there are to a great extent the same opportunities for specialising: one man makes a study of, and acquires a reputation for, successful church design; another one for theatres, another for hospitals, others for schools, hotels and so on. If one takes up the year-book published by any of the large Nonconformist bodies, showing, among other items of interest, the various churches and chapels erected during the year, it is surprising to find how often the same architect has been employed on this special work in different parts of the country. And these special practitioners, of various kinds, almost invariably have their office addresses either in London or in one of the large provincial towns. Secondly, talented and ambitious young men are attracted to these large towns, as to London, by the opportunities afforded for special supplementary training in well-equipped schools of art and science, on the one hand; and on the other, for gaining practical experience upon the details of large works, in the course of their daily office duties; and further, each one knows that should he be able to establish a practice, and meet with a fair amount of success, such success will be more pronounced, and secure more tangible results than would be possible in a small town; because in the latter the average cost of a building is only about one-tenth of what would be spent upon a building for similar purposes in any of the large and important centres. Therefore, in considering the practice of architecture in our smaller cities and towns, I wish it to be understood that I am referring to cities and towns having a population of about 60,000 or less.

Provincial Practice.

Here we find an architect practising under very different conditions to those obtaining in the Metropolis; he cannot specialise, the difficulties to be overcome are greater, the qualifications required to insure success are more varied (for it does not by any means follow that a successful London architect would have been equally successful in the provinces), and success, when assured, even at its best, must necessarily be upon a lower plane, both architecturally and financially.

Thirty or forty years ago all the best work in each of the cities and towns now under consideration was probably performed by one or at the most two architects, with a small staff of assistants; things generally moved slowly, and pupils were comparatively few. But during this period public enterprise has been great in all directions. With moneys borrowed at a low rate of interest, with repayments extended over a period of thirty years (the municipal debts of England and Wales stand at the present moment at something over 200,000,000*l.*, and a great part of this has been spent upon building works), our local governing bodies have built town halls, municipal offices, libraries, baths, schools, and infectious diseases hospitals. Then again, the Local Government Board insisted upon a higher standard of accommodation in our workhouses, necessitating the erection of improved buildings for the use of the sick and infirm, cottage homes for the children, and new kitchens and laundries suitable for the reception of steam-cooking and washing apparatus. The whisky money gave a great impetus to the erection of technical institutes. The construction of electric tramways necessitated the widening of a great many old business streets, thus compelling tradesmen to rebuild their premises, and a general rise in the prosperity of the country, combined with the introduction of new and rapid means of communication, created a desire for suburban residences.

An Overcrowded Profession.

One might naturally expect that the effect of this combined public and private enterprise would have been beneficial to every member of the profession, but such was not the case; whatever may have been the effect in the large centres, it certainly was not altogether to the advantage of architects then practising in the smaller towns. The large centres of population were naturally first in the field, the high values of property and their large areas for rating purposes enabling them, with the assistance of the moneys borrowed on easy terms, to provide those large and costly

* A paper read before the Society of Architects, January 17, by G. E. Bond, past member of Council.

buildings, without adding very materially to the rates. Thus began a period of prosperity for local practitioners. Parents recognising this desired their sons to become members of a profession with such bright prospects, and pupils flocked in, every successful man having twenty applications for one vacancy, with the inevitable result that, within a period of from fifteen to twenty years, these towns were overcrowded with young, ambitious men having varying degrees of experience, but all seeking opportunities for a practical demonstration of their talents and abilities.

The Coming of "Competitions."

By this time the spirit of enterprise had filtered through to the smaller cities and towns, and necessity or desire led to building developments of more or less important character. But, concurrently with the growth of municipal enterprise, came a development upon doubtful lines of the system of architectural competitions, and the local men, who had been looking forward to the enjoyment of a big share in the prosperity necessarily following upon the progress of their towns, had their hopes dashed to the ground by the action of unsympathetic, democratic councils and boards of guardians, who insisted upon submitting all the new and important work to public competition, with the result that those old-established practitioners who would not or could not adapt themselves to the new order of things gradually dropped out of sight, and new men full of energy and determination, trained and educated to the new conditions (and frequently they were those who had been crowded out of the nearest centre), stepped into their places, fought for and secured the prizes, and, as a result of those early struggles, are to-day firmly established and able to carry on an honourable and lucrative practice.

A Great Injustice.

But even at the present time, one of the chief annoyances to which an experienced and conscientious architect is subject is to find the best work in his town either thrown open to public competition or handed over to a specialist in London or the nearest provincial centre; he feels it to be a great injustice that, as a ratepayer, he should be called upon to pay an outsider for services which he, or a local *confrère*, could have rendered equally well, perhaps better. That knowledge of local conditions and resources, which he has acquired only as the result of a number of years continuous observation and experience, and which would have enabled him to secure the best results at the lowest possible cost, is ignored. He knows that, as a local man, with a local reputation to maintain, he is bound to keep the cost of a building within the limits of the estimate, and this knowledge is a very heavy handicap in a public competition, whereas his rival from a distance can, and frequently does, exceed the estimate by anything from 25 to 50 per cent. The evil results of competition of this character are most acutely felt in small towns, for it is only in such towns that competitions for buildings costing very small sums are invited; these sums may be anything from 1,500*l.* to 15,000*l.*, and are too small to attract experienced and successful men, the result being that the competitors are generally young men who have nothing else to do, who in some cases have not had sufficient experience to work out an estimate, but who are capable of presenting a set of drawings, worked up to a high state of artistic excellence, thus completely outshining, in the eyes of an inexperienced council or committee, the more solid productions of experienced local competitors who are not prepared to spend their time in elaborating their drawings.

A Choice of Two Evils.

No matter how unfair or unjust are the conditions, councils and committees are always able to obtain any number of competitors, so the local man must either compete or, as he more frequently does, stand upon his dignity and allow an outsider to secure the work; and he subsequently has the doubtful satisfaction of seeing the same carried out by a man lacking all sense of local responsibility, to the general dissatisfaction of the promoters and at a cost increased to the extent of 20 or 25 per cent. by the competitor's want of local knowledge. But in this respect conditions are not as bad as they were twenty or twenty-five years ago, when the competition craze had reached its highest, or rather its lowest development. In those days in some districts it became the rule to invite competition for every small job of a public or semi-public nature; in fact, my first successful competition, twenty-seven years ago, was for remodelling the end of a church, at a cost of 130*l.*

But country practitioners may congratulate themselves upon the fact that all councils and committees did not

pursue this doubtful course. In many cases the local man, having proved his ability and trustworthiness during a number of years upon smaller work, was given the necessary opportunity to prove his worth upon a work of importance; and seldom did he fail, because the experience gained during his years of trial enabled him to rise to the occasion, and carry out that work with credit to himself and satisfaction to all concerned. His success on this occasion placed him at once in the front rank locally, and he may go on from success to success; he has the ball at his feet, but he will still have to exercise the greatest tact and skill and strain every nerve to keep it there; he must continuously put his best into every attempt, for his position is never secure; a single failure may undo the work of years; he cannot, like a medical man, bury his failures; his works stand out boldly open to the criticism of all; by them he is judged, and they will remain monuments, either to his success or failure; it is his lot in life to be surrounded by rivals, ready to take advantage of every mistake he may make, so that throughout the remainder of his career he is compelled to labour just as hard and unceasingly to keep his place as he did when struggling to secure it.

The Keynote of Success.

Individual effort is the keynote of architectural practice, and to this may be attributed the comparative want of success attending all our attempts to initiate some effective form of combination, and I venture to suggest that, while encouraging in every possible way individualism, with regard to professional and artistic ideals, we ought to strive strenuously to break down that insularity which leads us to look upon our brethren as antagonists and causes every man to fight solely for his own hand; let us endeavour to make the profession socially and morally a concrete whole.

But should the successful practitioner be able to maintain his position, just consider what a variety of works he may be called upon to carry through during the course of a twenty-five or thirty years active practice in one of these small towns. He may run the whole gamut, from a town hall on the one hand to a common lodging-house on the other; including, perhaps, a theatre or music hall, churches, chapels, technical institutes, public libraries, banks, schools, baths, fever and general hospitals, infirmaries, cottage homes and other workhouse buildings, clubs, hotels, public-houses, steam laundries, factories, warehouses, business premises of all descriptions and residences of all dimensions and varieties; and during the third decade of that practice it may well happen that, as a consolation for the loss of the best work of his town in his earlier day, he may be then employed upon important works in various parts of his county.

A Valuable Training.

In the course of a practice such as this, the knowledge and experience gained ought to make the practitioner one of the most useful men in the district, for during his career he must necessarily have been associated with all kinds and conditions of men. He has received instructions from a bishop and has accepted practical suggestions from the labour-master of a tramp ward. He has met the elders and deacons in the vestry of a Nonconformist church, and has been behind the scenes in a theatre and behind the bar in a public-house, and tradesmen have explained to him the routine of their various businesses. He is frequently appointed arbitrator by the Courts in building cases, is called upon to give expert evidence before judges and magistrates; he is usually the expert member of deputations to the Local Government Board, Board of Education, Charity Commissioners and other bodies having administrative functions, and has possibly been appointed assessor in architectural competitions. He must understand the working of the Poor Law, the Licensing Law and the by-laws of all public bodies, and, without doubt, he is compelled by the circumstances of his position to be thoughtful, tactful and businesslike in all his undertakings.

Qualifications for Success.

Let us for a moment consider what are the necessary qualifications for successful practice in a small town. Putting aside the question of the influence of powerful friends and relatives, which is the same everywhere, I may say that after the usual artistic and practical knowledge of one's profession, business aptitude becomes a necessity combined with a keen, practical sense of proportion.

As a rule, the business man in such a town places use before ornament. He cares far more to have his premises suitable and convenient in every respect for his particular business than he does about the style or quality of his ele-

vation, and as it is usually only by making a special effort that he is able to rebuild at all, he naturally desires to cut down the cost to the lowest possible point. These being normal conditions, they require serious consideration, and it is here a young architect usually makes his first mistake. With possibly a London or large town training, and having undertaken the commission, instead of devoting his energies to the task of making himself acquainted with the methods of his client's business with a view to making the plans perfect in their convenience, his thoughts are chiefly centred upon the elevation; he is far more anxious that the building shall be a monument to himself than that it shall be perfectly adapted to its purpose. Now this is an injustice to the client and a great error in tactics on the part of a young architect anxious to succeed.

Study a Client's Interest.

In a very varied practical experience, extending over thirty years, I have always found it the best policy to study my client's wishes, interests and circumstances, and to carry out his instructions to the letter. With tact one can generally persuade him to allow one to suitably arrange the elevation. He may not understand the plans, but there is no excuse for the architect not understanding him; it is one's duty as expert adviser to get a thorough grasp of his ideas before committing himself to the fulfilment of a contract. I do not wish to labour this point, but I have known several instances where a client, with the intention of doing a good turn to a young fellow starting a practice, has placed a small job in his hands only to find that he, having big ideas of how the work should be done, practically ignores the instructions he has received, with unsatisfactory results to both parties; and this is the reason why clients with little money to spend fight shy of the highly-educated young architect, and instead employ a builder's clerk or one other of the many persons who are to be found in every town capable of geometrically arranging upon paper a man's requirements, and who will treat the matter strictly as a matter of business and carefully obey instructions, rather than try to earn a reputation as an artist at a client's expense.

Ideals of Common Sense.

It may be said that these idealistic young men are comparatively few in number, but nevertheless they are capable of causing a deal of trouble and of inducing in the public mind a want of confidence in the business qualifications of architects generally. I remember sitting next to one of these young gentlemen at the Society's annual dinner some seventeen or eighteen years ago; he was about twenty-four or twenty-five years of age, and assured me, as the result of his experience, that clients, as a rule, knew nothing about architecture: that one only had to bluff the Jonnnies to get one's own way. He said he was always careful that all parts of his buildings should be in perfect harmony; and to secure this result he had to prepare drawings for every part, down to the smallest details, even to designing his own knockers and door furniture. That young man must now be at least forty years of age, and it would be interesting to know whether he still designs knockers and door furniture.

The necessary qualifications, therefore, include the possession of a sufficient amount of common sense to enable one to recognise the fact that it is possible for a client to understand his own wants best. To succeed a man must be prepared to study carefully and conscientiously the requirements and routine of every class of business, and the manner in which each of the religious bodies conduct their services, before he can design either business premises or churches or chapels, perfectly adapted to their various uses; and the same may be said of every other class of building with which he may be associated.

The Coming Men.

In the whole of the preceding remarks we have been considering to a great extent the position and the opportunities of the successful man only, say, perhaps one man in twenty; what about the other nineteen? These are the gentlemen who would chiefly benefit by the passing of a Registration Bill, and for whom this Society has been, and is now, strenuously working. The men at the top, whether in London or in the provinces, who are effectively taking the cream, can well afford to sit still while their less successful brethren are struggling to secure a share of the skimmed milk. Of course, among such is to be found a large percentage of mediocrity, but a large majority are capable and conscientious practitioners. Some of the younger men have great talent and are fighting their way

to recognition, and with fair opportunities and that experience which time only can bring, will in the future take the places of the successful men of to-day; others there are who are artists to the core, but lack method and business aptitude; and, as in all other professions, a small percentage are failures from other causes. While some are not smart enough, others have earned a reputation for being too smart; but one and all suffer from the inroads made into their opportunities of employment in the honourable profession they have adopted as a means of livelihood by a host of persons who adopt architecture, generally in its lowest form, as an auxiliary means of adding a few pounds per annum to the incomes they earn from their more legitimate callings.

The Need for Registration.

What with the large general furnishing firms, builders, shopfitters, bar fitters, horticultural builders, and others who advertise themselves as willing to send down, take measurements, and prepare plans, specifications and estimates, free of cost, on the one hand, and estate agents, auctioneers, business valuers and commission agents who add architecture and surveying to their other work, on the other, the profession is becoming one of the worst a young man could possibly enter, and it is small wonder to find some of our less successful brethren adding insurance agencies and rent collecting to their legitimate calling, and as a strong reaction has set in with regard to municipal expenditure, the general outlook is black indeed.

The Training of an Architect.

Under the conditions previously referred to it must be perfectly obvious that the training of a number of pupils will be poor, their opportunities, as far as practical work is concerned, being in some cases nil; while pupils and assistants in the best offices have unique advantages—better, I venture to suggest, than could be obtained in a large specialist's office—for they are employed upon works of the most diverse character, giving them such a wide experience that in the future they will be prepared to solve almost any building problem. They can visit the buildings upon the drawings of which they have been engaged, discuss constructional difficulties with the clerk of works or general foreman, acquire a practical knowledge of materials, and are brought into contact during the course of their daily work with clients of all kinds.

But taking the other extreme, those opportunities are reduced to vanishing point, for it is well known to all of us that there are at the present moment men in practice who do not possess a single architectural qualification; who earn a scanty living by preparing plans for small speculative builders and other odds and ends, such as small alterations and repairs, dilapidations, schedules and working out builders' accounts, with possibly a rent-collecting business thrown in to fill up time; they cannot afford to keep a clerk, but take a pupil, whose opportunities are small. His duties commence with holding the ring end of a tape and minding the office, and finish with tracing and copying such odds and ends as his master has been able to secure; and between these extremes pupils and assistants have very varying opportunities for acquiring a knowledge of their profession.

About Office Hours.

But, as we all know, a young man cannot acquire a sound working knowledge of his profession should he confine his study to office hours, so let us see what are his opportunities for supplementing his office training in a small town. He cannot, as in the large towns, gain a knowledge of materials and tools by attending a polytechnic, nor attend schools under teachers having special qualifications for teaching the art and science of architecture and building. True, there may be an art school or technical institute where he may be taught building construction by a schoolmaster in possession of an advanced stage certificate, and he may receive art teaching, including architecture, from an elementary school teacher, assisted possibly by a lady who had qualified in the same school; but as a rule, no attempt is made to teach a student how to practically apply what little knowledge he has been able to gain, the *raison d'être* of the technical institute's existence being apparently not so much to impart useful and practical knowledge, as to earn the Science and Arts grants from the Government.

Mediocrity and Incompetence.

So pupils and assistants who are in earnest and who are determined to succeed leave these institutes severely alone and more usefully employ their time in private study, assisted by the ever-increasing number and variety of really

excellent books now published on architecture and the allied arts and sciences. But with so many other opportunities of agreeably spending their spare time, comparatively few apply their minds to study out of office hours; therefore, considering how little real training it is possible to obtain in some offices, we are quite prepared for the fact that a large number of incompetent young men are constantly being turned adrift on an already overcrowded market; some are never again able to retain a position, but drift about from one office to another for a few years, and, ultimately abandoning all ideas of practice, settle down in some business more adapted to their peculiar qualifications.

The First Effect of Registration.

The compulsory examination, which would necessarily be a corollary of registration, would tend to check this flow of mediocrity and incompetence into the ranks of the profession, for a pupil would then appreciate the absolute necessity for study were he compelled to pass a qualifying examination; as it is he does not recognise any such necessity, many permitting themselves to carelessly slide just at the time when they ought to be laying the foundation of future success. I can speak from personal experience, for in the case of my own pupils two are Associates of the Institute, two have passed the intermediate examination, and one is a member of this Society, while two others never did an hour's study outside the offices.

The Development of the Society.

Now, with regard to the future membership of the Society, we ought strenuously to seek the co-operation of the younger men in the profession, whether in practice or not, for we must remember that the assistant of to-day will be the practising architect of to-morrow. I feel sure that many members have in their offices capable assistants, whose careful and excellent work shows distinct promise for the future, and who would be pleased to accept nomination at the hands of their principals; I introduced two such last year. The necessity for registration ought to be an article of faith with all young men; they are the persons who, in their efforts to establish a practice, find the natural difficulties of the task enormously increased by the unfair competition of a heterogeneous multitude who now tout for most of the smaller works. The leaders are apathetic, because these evils do not affect them; they are engaged in the otherwise commendable task of demonstrating to the public their individual capacities for the performance of the highest class of work; many of their buildings compare favourably with those of the great designers of the past, and will undoubtedly be a source of inspiration, both to their contemporaries and their successors, but this is not enough to secure the ultimate good of the profession as a whole. The head may hold itself high, enjoying the bright sunshine, but if the body is held down by the tangled weeds of unfair conditions and attacked by an ever-increasing number and variety of parasites, sapping its life blood and cutting off its proper and legitimate nourishment, the time must come when that head will be dragged down and the whole body brought to a level, overwhelmed by the noxious growth which has fattened on its vitals.

The Supreme Test of Architectural Ability.

But whatever the head may do, the body is now fighting for life, and is determined to clear itself of the tangled growth by which it is fettered. The steady growth during recent years of collective consciousness has opened up an avenue of hope leading us to look forward with confidence to the day when our objects will meet with ultimate success.

The opportunity for designing buildings of a monumental character cannot possibly be given to us all; environment to a great extent regulates the character and quality of our opportunities. We country practitioners must adapt ourselves to circumstances and be prepared to carry out conscientiously the more or less humble works required by our public and private clients; any lofty ideas we may have must necessarily be subordinated to considerations of a financial nature, our ideals in most cases having to be modified in order to bring the cost within the limits laid down by our employers. Therefore, I venture to suggest that the man who, as the result of a wise and thoughtful exercise of his energy and ability, has been able to secure and maintain through a number of years the confidence of his fellow townsmen, and who has carried out to their satisfaction a large proportion of their most important works, is equally deserving of credit with his more prominent metropolitan confrère. For after all the supreme test of architectural skill is the ability to design a building

perfectly adapted by convenience of its internal arrangement to meet all the requirements of its users, and in a style suitable to and in harmony with its environment, whether simple or ornate.

The Use of Opportunities.

We have men in our ranks who have attained this local eminence, and also a large number of talented and conscientious men awaiting the time of recognition. Some of these, and perhaps not the least deserving, may never be fully recognised, for the sentiments expressed in Gray's "Elegy" are as applicable to members of our profession as to those of other callings. While their more ambitious and energetic brethren are laboriously and strenuously climbing the steep hillside, turning neither to the right nor to the left, unceasing in their efforts to reach an ever-receding goal of success and fame, these others seem to have been "born to blush unseen;" usually having grand ideals, they lack enterprise. They dream of cathedrals and palaces on the heights of success, while their less talented, but more strenuous, brethren are securing all the coigns of vantage leading to those heights. They love not the feverish bustle and excitement of modern life, they avoid the busy haunts of men, and meander at their own sweet will along the quiet and easy roads in the valley, stopping frequently to pluck the flowers at their feet, and absorbing all the beauty and fragrance by which they are surrounded, because they have not the power (through lack of opportunity) to reflect it in their works.

The late Dean Hole, in his book on roses, says:—"He who would have beautiful roses in his garden must have beautiful roses in his heart." Applied to our art this sentiment may be rendered:—"He who would design beautiful buildings must have beauty in his heart." To bring forth architecture in its best, purest and most abiding form, one must have not only the ability to appreciate and enthusiastically admire the finished product, he must also have power to conceive, and his soul must be filled with the thoroughness, reverence and tenderness of love to enable him to overcome the difficulties necessarily involved in the execution of his work, down to its smallest detail, whether conceived in grandeur or simplicity. His ideals need not be dominated nor trammelled by the dogmatic art-teaching of any special school, nor yet by the more ephemeral caprice of fashion; for beautiful lines, beautiful forms and beautiful colours are constant in the effect they produce upon the mind, and are capable of an infinite variety of harmonious combinations.

These great artistic qualifications are not monopolised by the prominent practitioners either in London or the large provincial centres, but are diffused in varying proportions throughout the provinces, and their effects may be seen and recognised as often in the country as the town. And as it is now to us a source of pleasure and inspiration to visit, sketch and contemplate the beautiful old country churches, guildhalls, mansions and cottages designed by unknown or forgotten masters of past ages, so will future generations of architects, when hard lines and harsh tints shall have been softened and mellowed by the hand of time, discover new beauties in the scattered architectural gems of our smaller towns and villages, the work of our present-day architects. Their names will be then equally unknown or forgotten, but I am sure their works will form a strong and genuine link in the long chain of architectural evolution, inspiring their successors to still higher and nobler developments.

Discovery of Roman Remains in Manchester.

SIR,—Excavations now being conducted on a site in the centre of Manchester by the local branch of the Classical Association have already yielded results of more than local importance, and we should be glad if you will allow us to make them briefly known.

The plot of land in question, which lies within half a mile of the Central Station and is bounded on the south by the curve of the Manchester South Junction Railway, has never been occupied by any buildings since Roman times, and it was the information that this area had been let for building purposes that led our excavation committee to take immediate action. The results that have been obtained are

due to the enterprise and determination of its hon. secretary, Mr. F. A. Bruton, M.A., of the Manchester grammar school, who conducted the work for more than a fortnight amid the recent snow and rain, aided by the advice of Mr. John Henry Hopkinson, M.A., lecturer in archæology in the University of Manchester.

Observers like Whittaker in 1771 and Corbett in 1849, when some scanty traces of the Roman fortifications could still be traced among the mounds and hollows of a waste grassy meadow, had placed the western wall of the Roman camp of Mancunium at varying distances from Duke Street, which bounds the site on the east; and our present search was directed, in the first instance, to locating this rampart precisely. Corbett's notes pointed to its being found just inside our enclosure, but the stone remains uncovered there by Mr. Bruton, about 4 feet below the present surface, proved to be those of a building at least 14 feet wide. On this were found well-preserved portions of a beautiful Samian vase from Lezoux (130-200 A.D.). Another set of foundations 10 feet further west again disappointed—and delighted—us by proving to be not the wall, but the base of another building. Pushing some 20 feet further west we had the satisfaction of uncovering what was unmistakably the base of a rampart, a breadth of some 6 feet of Roman concrete about $2\frac{1}{2}$ feet deep imposed on the characteristic stratum of boulder stones embedded in puddled clay about 18 inches deep; beneath that about a foot of solid clay spread over the natural gravel. A large number of squared blocks of sandstone, clearly taken from the wall, had been found a little above the concrete, though not *in situ*. Just inside the rampart, in the sand and gravel which represent the Roman surface, we found two coins—one of the ill-fated Geta (211-2 A.D.), the other of the mother of Geta and his murderer Caracalla, Julia Domna, the wife of Septimius Severus, struck some time after his accession (193 A.D.), and his death at York in 211. The combination points to a rather precise date for the dropping of the coins in the camp. The discovery exactly confirms Whittaker's measurements.

Among other interesting finds we may mention a perfect grindstone, of a pattern not yet recorded, and several well-worn floor tiles. It is clear that Mancunium was a camp containing rows of permanent stone buildings.

Completely to explore the half acre of Roman soil now happily defined a large sum will be needed. The Lord Mayor and citizens of Manchester are doing their part generously, but we may be allowed to appeal to all who are interested in Roman Britain and the work of the Classical Association generally to send contributions towards the fund to our treasurer, Mr. Harold Williamson, M.A., the Grammar School, Manchester.—We are, yours faithfully,

EDWARD LEE HICKS, }
ROBERT SEYMOUR CONWAY. }
Vice-Presidents of the Classical Association;
President and Chairman of the Manchester and District Branch.

Manchester: January 12.

GENERAL.

The Architects elected as members of the committee of the Salon for 1907, 1908 and 1909 are MM. Pascal, Laloux, Daumet, Vaudremer, Nénot, Moyaux, Louis Bonnier, Raulin, Deglane, Blavette.

The Library Committee of the City Corporation have issued a report showing that the attendance at the recent exhibition of Flemish masterpieces at the Guildhall Art Gallery was 137,521, bringing the total attendances at special art loan exhibitions to 2,662,292. The average daily attendance was 1,800, while the Sunday attendances reached 4,624. Catalogues to the number of 15,796 copies were sold, these representing a sum of nearly 400*l*. The total expenses of the recent exhibition were 1,232*l*., from which must be deducted the amount received by the sale of catalogues. The sum expended was 387*l*. in excess of the grant made by the Court of Common Council. The next art loan exhibition will be one of Danish and Norwegian masterpieces.

A Special Effort has been inaugurated by a committee of women for a definite share in the restoration of Selby Abbey. They have resolved to form an "Association of the Women of England," to whom shall be assigned the definite work of raising funds for the restoration of the "glorious choir of Selby," including its sanctuary, stalls, screen, pavement, &c. It is desired to collect a sum of 20,000*l*.

The Birmingham Town Council have formally appointed Messrs. H. V. Ashley & Winton Newman as architects of the Council House extension.

The Art Union of Ireland have resolved unanimously:—That the committee of the Art Union of Ireland, having read the report of the Parliamentary committee of inquiry into the working of the Royal Hibernian Academy and the Metropolitan School of Art, desire emphatically to protest against the report and recommendations of the majority of the Parliamentary committee, and that the minority report commends itself to all those interested in the cause of art in Ireland and in the encouragement of the schools.

A Meeting was held at Shrewsbury on the 11th inst. to appeal for funds for the restoration of the abbey church, Shrewsbury, which was founded by Roger de Montgomery. The monastery was formerly one of the greatest in England, and the abbot had a seat in Parliament. The bones of St. Winifred first rested in the abbey, and were reputed to have worked many miracles. The principal weakness is in the stately tower, which is threatened with destruction. Four thousand pounds is required to make the structure safe, and 1,000*l*. has been subscribed. The church will probably become the cathedral of the proposed bishopric of Shropshire.

At Llandudno, during the making of Mostyn Broadway a new thoroughfare connecting Llandudno with Craig-y-don a large quantity of soil has been carted from the slope of the Little Ormes Head, above Craigsidde Hydro. A carter shovelling earth came across a case of bronze. It broke, and was discovered to be full of bronze Roman coins, which are believed to be of the third century, and the bust of the Emperor Aurelius upon some of the best preserved is recognised from the design of Roman coins in the British Museum.

The Hertfordshire County Council have agreed that Mr. A. Dryland, county surveyor, having been appointed county surveyor of Wiltshire, a successor be advertised for to commence his duties on March 31, the salary to be 500*l*. per annum, the surveyor to give his whole time to the duties and to undertake no private practice.

The Chairman of the Glasgow School of Art has received a letter from the chairman of the Royal Glasgow Institute of the Fine Arts in which he states:—"I hoped to arrange for a contribution to be made from the funds of the Institute towards the erection of the proposed extension of the School of Art buildings, and it was with very great disappointment that I received an intimation from our law agents that the Institute was not at liberty, under its constitution, to give a subscription to your building fund. It was the unanimous feeling of the Council that, although we could not assist you substantially, we should convey to you our best wishes and an expression of the highest appreciation of the work which the School of Art is performing in our city. We all hope that the funds you desire may be secured promptly and easily, and we regret that it is not in our power (in our corporate capacity) to assist you."

A Resolution will be proposed by Alderman Bicker-Caarten at the next meeting of the Paddington Borough Council, expressing the opinion that the time has come when steps should be taken to erect a public hall for the Borough of Paddington, and that the question should be considered by the general purposes committee.

The Original Coloured Drawings, from which the reproductions of the old masters issued by the Arundel Society were made, have recently been rearranged in the National Gallery, and are divided into their separate schools and arranged in historical order. In addition, about a dozen drawings have been transferred on loan from the education department of the Victoria and Albert Museum at South Kensington to complete the collection.

The British Academy has received the sum of 10,000*l*. for the purpose of establishing a memorial to the late Mr. Leopold Schweich, of Paris. The endowment is to be devoted to the furtherance of research in the archæology, art, history, languages and literature of ancient civilisation with reference to Biblical study. Any article of interest which may be obtained by excavators is to be offered in the first instance as a gift to the British Museum, or if the class of article be already adequately represented in the museum, then such article is to be offered as a gift to some other museum in the United Kingdom.

The Architect.

THE WEEK.

THE claim made by the late WILLIAM MACKISON, the engineer to the Corporation of Dundee, on account of extra work, has not lapsed through his death. Originally the claim was for 49,601*l.* But Mr. MACKISON reduced it to 15,000*l.* A preliminary skirmish took place in the Court of Session recently. Counsel for the Corporation sought to obtain a detailed account of all the items in order to ascertain on what grounds the reduction took place. Lord ARDWALL, the judge, said the plaintiff was competent to reduce and that he was not bound to specify his reasons in each case. The words used by his Lordship will possess interest for borough officials throughout the country. His Lordship said that corporations must know perfectly well when works are carried out. They did not need to be informed of that. He did not know that it was suggested that a detailed account should be presented of all the work which was done by the deceased gentleman in preparing plans for special works under special Acts. Such an account was not, as a rule, demanded in such matters. Engineers and architects and persons in similar positions did not charge as masons or bricklayers did—so much per hour—for their services. They were allowed a certain amount, proportionate to the value and importance of the works done, and it was on that footing that the memorandum in this case was priced. He thought it was a perfectly competent and sufficient statement of action, and he did not think, when the case went to trial, the Corporation would have any difficulty in determining as to the items. Costs were given to Mr. MACKISON's representatives. The trial will be important, for it remains to be seen whether a borough engineer, who is usually engaged to perform specified duties, is obliged to undertake others, or which high fees are usually paid to unofficial engineers and architects, without receiving additional remuneration. The case will also determine whether the Statute of Limitations applies in cases when it can be said that the work was continuous.

In the early part of 1906 we reported some unusual cases which were tried at Leicester. In one, plaintiff, a builder, sought to recover 465*l.* from a building owner. The defendant's plea was that the money had been paid to the architect. Although formal judgment was not given, it was known to be in favour of plaintiff, but the money remains unpaid. The case of CHAPMAN v. BURLEY came again before Mr. Justice WALTON but in the King's Bench Division. Counsel for plaintiff asked that judgment should be entered for him, as it was understood the defendant intended to bring the case to the Court of Appeal and possibly to the House of Lords. Counsel for the defendant said that Mr. BURLEY had handed over to Mr. JOHN GOODACRE, the architect, a large sum of money, and, naturally, he did not want to pay for the same work twice over. The architect had attempted to commit suicide, and had been removed to a lunatic asylum, and in this case the plaintiff looked to the architect for his money, and gave him his receipts. Moreover, the work had not been really done by the plaintiff, but by other persons. Of the 465*l.* alleged to be due only 125*l.* was claimed by the plaintiff, the remainder being alleged to be due to other tradesmen in various sums. Mr. Justice WALTON said he considered that the money ought to be paid, but upon the understanding that the defendant should have a discharge from the other persons to whom certain portions of the money was due, so that the defendant should be protected from any claim by any of the tradesmen who were said to have actually done the work. It was then agreed that the money was to be paid subject to a guarantee being given, and the question of costs should be held over.

The contract was entered into in March 1903, and amounted to 3,990*l.* The question really turned upon whether a client can pay an architect as an intermediary instead of settling with the contractor directly.

THE last exhibition which was held in the Guildhall could be considered successful, inasmuch as the Corporation of London enabled the public to see a great many examples of ancient and modern Flemish art which were novelties to the majority of visitors. The galleries were enjoyed by 137,521 persons. The expenses amounted to 1,232*l.* 6*s.* 10*d.* Of that sum 555*l.* had to be paid for insurance, the value of the works being estimated at 366,580*l.* For the catalogues 394*l.* 18*s.* was paid. The Court of Common Council allow 450*l.*, and consequently there has been an excess of 387*l.* 8*s.* 10*d.* It was anticipated that a larger sum would be received from the sale of catalogues. Only 15,796 copies were sold at 6*d.* each, and the profit derived from them was only 183*l.* 7*s.* From the catalogues of the Spanish exhibition the profit was much larger. The subjects of the pictures could not have been familiar to the majority of visitors, yet only one out of every eight visitors cared to invest in the catalogue, which as usual contained a large amount of information.

THE subscribers to *L'Art* may well congratulate themselves on the excellent plates which they obtain as supplements at the end of the year. Those for 1906 comprise a very large etching, *Un Quai à Rouen*, by E. DAUMONT, after a painting by CH. APOSTOLET; *Autour du Piano*, by the regretted A. LALAUZE, after one of JEAN BÉRAUD's Parisian scenes; *La Leçon de Lecture*, from a painting by TERBURG; *La Culture des Tulipes*, by M. CHAUVEL, the director, after the painting by the American artist, G. HITCHCOCK. The portrait of VICTOR HUGO after the marble relief by DENYS PUECH is enough to suggest that the art of wood-engraving is well supported in France. The latest number contains several reproductions of exquisite seventeenth-century miniatures. After twenty-six years *L'Art* continues to be entitled to its prominence among French publications relating to art.

ROAD contractors in Ireland are legally authorised to enter on lands where stone is easily obtainable, and by paying a nominal rent of, say, 1*l.* a year, to quarry and remove as much stone as is required for repairing roads in the district. The contractor may not, however, use the stones for any other purpose. This was decided at the Antrim Court of Sessions a few days ago. The tenant who held the lands claimed 20*l.* from two road contractors for removing a quantity of stones from his land and converting them to their own use. The defendants stated that five years had elapsed since they obtained the magistrate's order, and that no objections were raised to their operations. The Judge decided that it was illegal to remove any stones which were not required in the public interest, and gave a decree to the plaintiff. The case exemplifies a practice which is common in Ireland, and which is an abuse of an Act passed for the benefit of the public by reducing the cost of roadwork.

THE tower of Shrewsbury Abbey is in a dangerous condition. Last summer scaffolding was erected to enable Mr. HAROLD BRAKSPEAR to make a close examination. He reported that on the south and west faces the stone for a depth of 6 inches is so friable it can be scraped with a stick. The sills of windows are hopelessly decayed. Some of the buttresses require renewing. It is proposed to use selected Runcom stone for the reparations. A tender has been accepted amounting to 2,625*l.* if the whole of the work is put in hand, or 100*l.* additional if in sections. Altogether 3,500*l.* will be needed. Towards that sum about 1,050*l.* has been subscribed.

INTELLECTUAL INFLUENCE OF ARCHITECTURE.

ON Thursday in last week one of those events occurred which give delight to everyone in Paris who has respect for intellectual pursuits. There was a formal reception of a new member at the Académie Française. M. MAURICE BARRÈS has succeeded to the chair last occupied by M. HEREDIA, the poet, and, in accordance with custom, he delivered an eulogium of his predecessor. So practised a writer as the new Academician could hardly fail to compose an eloquent discourse on such an occasion. But we need not attempt to criticise what was said on a purely literary subject. It is the rule when the discourse is ended for another Academician to reply. Sometimes the second discourse, although always courteous, is not laudatory, especially when the two Academicians belong to different schools of literature. On the last occasion the duty was undertaken by Vicomte DE VOGÜÉ.

Like his father, the Marquis, M. DE VOGÜÉ is an amateur of architecture, and no one present was surprised when he endeavoured to prove that the art of arts exercised a formative influence upon the mind of M. BARRÈS. The new Academician it appears was educated in the University of Nancy, and some Frenchmen consider there is no provincial city in their country possessing a higher architectural value. Accordingly, in addressing him and tracing his career M. DE VOGÜÉ declared that while studying in the noble capital of Lorraine its edifices insinuated in the mind of M. BARRÈS lessons of taste, discipline and harmony. At such a time the representative of the traditions of the French Academy knows that every one of his words will be weighed, and he has therefore to be careful in his utterances and to avoid the slightest exaggeration. Was M. DE VOGÜÉ right in attributing so much power to the architecture of Nancy?

We must admit that at the present day it would be difficult for any patriotic student who did not possess extraordinary power of concentration to give much attention to the buildings in that city. Nancy is close to the frontier, and some of the battlefields of 1870-1 are almost within sight. It has become one of the most important of military stations. There are warlike evolutions almost daily, and the scenes have so much attraction, a university student in his spare hours would be likely to prefer the manœuvres which take place amidst picturesque surroundings to gazing on architecture. But in the old days Nancy was likely to surprise not only people from rural districts, but even from Paris. In the seventeenth and eighteenth centuries much was done to render Nancy beautiful. STANISLAS, the Polish prince who obtained through his wife the dukedom of Lorraine, was not only an enthusiast for architecture, but a man who could realise the necessity of laying-out streets with a view to the future. At a time when so much is said about remodelling cities and towns, it is surprising that Nancy is not selected as an example, for it suggests what can be done on a limited scale. In the time of STANISLAS the population was not likely to exceed 20,000 inhabitants. But there are public places, promenades and open spaces which can now serve for three or four times that population. The official buildings, if judged by modern ideas, now appear to be small, as it is common to see only a couple of storeys and an attic in them. But if we remember the circumstances of the time when they were erected, it can be realised that they were all on an adequate scale. It would be difficult to discover a more satisfactory group than that which surrounds the Place Stanislas, and which helps to suggest that other picturesque spots are near. The architecture is Renaissance of the eighteenth century, and gratifies the eye by its modesty. It upholds tradition, for the fragment which remains of the ducal palace enables one to conclude that in the fifteenth century no public building found in Nancy was remarkable for the loftiness of its elevation.

A man must have an odd organisation who does not derive pleasure from what he sees in Nancy. It does not consist entirely of palaces. There are streets which vary in their architectural merit. But those which belong to the eighteenth century, forming the majority, are not commonplace. STANISLAS had a *penchant* for wrought-ironwork—a strange hobby for a ruler of the Ancien Régime era—and the people gratified him by employing wrought-iron screens for their windows and balconies. There is, in fact, so much that is pleasing to a visitor, he is likely to draw the conclusion that the people who live in the city and walk every day through the streets must be benefited by what they see. Evidently M. DE VOGÜÉ holds that opinion also.

When, however, he suggests that the sight of the buildings in Nancy can have much to do with the making of an Academician, sceptics are likely to ask how many celebrities have come from the city. CLAUDE the landscapist, who has a memorial in it, could not have been inspired by the eighteenth-century buildings. JOAN OF ARC, although there is an equestrian statue in an out-of-the-way street, belonged to Domremy, which is thirty miles distant. CALLOT, the etcher, and ISABEAU the miniaturist, are the artists who are most associated with Nancy, although it might be supposed that with such surroundings art in all forms would flourish. The tombs in the older churches would be enough to inspire a youth who had the least tendency towards sculpture to abandon everything for its sake. Particular tests of the kind we have mentioned can, however, rarely be employed, for who can determine the rules for genius? University towns, although they may possess scholarship, somehow are rarely rich in distinguished natives. Much else is required besides a beautiful environment to make a man successful in either literature or art. But in a lesser degree there can be no question that fine buildings have an appreciable effect in mental cultivation, or it may be in disposing the mind for cultivation. If GOETHE was right when he said that it was a duty for everyone to make it a rule to see a pleasing picture, drawing or engraving, to read a poem, and to express a few reasonable sentences every day, can we not suppose that a number of buildings which could be considered as true representatives of architecture would be no less effectual? We are in this country so self-reliant, we are apt to forget that service can be rendered to us by works which belong to other men, and in the creation of which we have taken no part. Foreigners, who are brought up under different conditions, look on the things around to benefit by them. Accordingly they visit our museums, and on leaving would be able to render an intelligent account of what they saw, whilst true Britons imagine they have discharged their duty by passing through the galleries with more or less expedition. M. DE VOGÜÉ was addressing his own countrymen when he spoke about the lessons in good taste, discipline and harmony to be derived from the buildings at Nancy, and it would be unfair to judge him by an ordinary English standard.

In looking at buildings or other things it is well to remember that the intellect may be either active or passive. In the latter case the impressions derived cannot be very deep and are only transitory. For observers in that state such a city as Nancy may afford few lessons and will not be an aid in training. It is to be feared that too many of our countrymen when they look at buildings are without that attention which is connected with activity of intellect. Indeed, the criticism which has been expressed about modern buildings in London would appear to have come from men who had no clear recollections of what they saw, and who made up for negligent observation by drawing on their imagination for defects which were supposed to be inevitable. DICKENS described Venice as if he saw it in a dream and did not waken until he found himself in Verona. Many other English travellers appear to have seen things while in a similar condition.

In an academy, even though it may be the highest of all, it is fitting to talk of discipline and the educational influences of buildings. But men were not made to be always learning. It is likewise advantageous, and we ought to be grateful for the susceptibility, that beautiful objects can give us pleasure of a refined kind. Buildings, fortunately, can serve that end as well as pictures or statues. To those who are qualified to understand them, examples of architecture can be more influential than those of the subsidiary arts. A building may be wanting in colour, but statuary generally suffers from the same privation; moreover, all that can be obtained by lines and contours and their contrasts, by diversity of masses, and the variations of light and shade can be provided by a building. Largeness, when properly managed, is also an element of mental pleasure, and no work of painter or sculptor is in that respect equal to an architect's building. We must allow that in variety of subjects the architect is more handicapped than his brother artists. But he can at least provide that quality by calling in their aid. We may compare an architectural work to the shield of ACHILLES. At first it was a strong and specious piece of metal of varying hues, surrounded by a triple ring and with a silver handle on the back. In that state it afforded ample protection to a warrior, and would have been coveted by a Greek or Trojan chief. But the godlike metal-worker was dissatisfied until, for his own pleasure and the delight of all who saw it, he made the shield become a mirror of human life. Architecture can be satisfactory and give pleasure through its own qualities. But when supplemented by the work of other artists it becomes incomparable. If it were not so architecture would not have such a history.

Buildings which are works of art cannot, like paintings and statuary, be reserved solely for the enjoyment of the owner. It is very hard to conceal a building, and precautions for the attainment of that end only whet curiosity. Like everything else made by human hands, temples and palaces can be destroyed, but in spite of all the vicissitudes they have sustained, the world still possesses buildings commenced at a very distant period, and their ruins still afford pleasure. For the associations which gather around a building appeal with stronger force than those connected with the works of either painters or sculptors. The associations are a source of pleasure, and hence it is that the work of the architect, as long as fragments survive, appeals to men with a power which is irresistible. To go back to Nancy, the tomb of STANISLAS in one of the churches is impressive. But there are others which rival it in that quality. Who would care to distinguish him from the other dukes if he possessed no other memorial? But when we stand in the place which bears his name we seem to have the man himself before us more clearly than he would appear in any history of his reign. For we can realise by looking around that although he was a stranger, he endeavoured to make his subjects happier by providing for them spectacles in which art and nature were auxiliaries, and which could not fail to render their lives more agreeable. No doubt STANISLAS could not lay out such a number of streets in straight lines and right angles without destroying some relics of the past. But he respected whatever was of importance, and the city he created is sufficiently satisfactory in itself. It can give pleasure to natives and visitors, and it may be, as M. DE VOGÜÉ maintains, do still more for a superior class of minds.

Mr. H. Wilson, examiner, in his report on the annual exhibition of work by students at the Vittoria Street Jewellers' School, Birmingham, insists on the necessity of opening the school in the daytime, thus turning it into a raining school for the production of practical workmen in all branches of the trade. The establishment of day classes would obviate inconveniences at present experienced, and be of the greatest possible benefit to pupils, teachers and employers.

MARBLE DECORATION.

THE extent of the admiration for coloured marbles in England is suggested when we find that even at the present day cheap wall-papers representing marble slabs are a marketable commodity, and that house-painters endeavour to create something with their brushes which will have a resemblance to them. Respect for marble real or sham is an inherited quality. In a country like England, where commerce has such power, it was hardly possible to prevent the importation of a variety of marbles at an early period. But the prices charged for them and the difficulty of working them necessarily limited their use in construction. Every Englishman who made the Grand Tour could not avoid observing marble in foreign buildings and must have desired to see so beautiful a material in his mansion. Trade is always equal to meet demands, and it is likely that the introduction of marble chimneypieces in this country was mainly owing to the desire to possess some example of so beautiful a material. JOHN EVELYN in the time of CHARLES II. describes a visit to a "rare magazine of marble" in Lambeth, where he went to order chimneypieces for a friend's house. The owner was a Dutchman, who, we are told, "had contracted with the Genoese for all their marble." Foreign workmen were, no doubt, employed on the production of chimneypieces in England, but after a time it became a rather important national industry. In old-fashioned books on building we can find instructions not only for setting out such work according to the styles in vogue, but also for staining the marble. Evidently efforts were common to make cheap marbles resemble those varieties which were expensive.

The material that was generally used was obtained from foreign quarries. Although it was known that in England there was fine alabaster, yet the wealth of this country in marbles had not been revealed, and there was not sufficient desire for native products to justify expensive investigation and more costly quarrying. Certain of the most prized varieties are not to be derived from the strata of any part of Great Britain. For instance, we cannot compete with Carrara for the marble which sculptors require. But there can be no doubt that an abundance of coloured marble is available. Questions of cost have, however, to be considered. Competition in building is too close to admit of sacrifices to patriotism, and if coloured slabs can be offered in London or any English town from Belgium and from Galway, it is easy to imagine which will be preferred by a building-owner. This is the more to be regretted, for as there is a wide field for the use of marble for lining or casing walls, it is unsatisfactory that foreigners should be profiting by the demand rather than the quarry-owners and stone merchants in this country. The subject is one which deserves more consideration than it receives. The desire to employ marbles to cover walls of inferior material cannot be considered as enduring. The demand for slabs is increasing no doubt. But the genius of architecture is whimsical, and in a year or two something else may become the fashion. When WILLIAM BURGESS proposed to introduce marble veneering in St. Paul's he was supposed to have committed a sacrilege. English thoroughness revolted against the attempt, although it cannot be said that St. Paul's has gained by what was substituted. Those engaged in the preparation of marble, therefore, are disposed to pause before they crowd the markets with slabs which may not be immediately required. The railway companies, it is needless to say, never aid in the promotion of any industry, and especially of one connected with building. The consequence is that beautiful marbles from Devonshire, Cornwall, Kilkenny and the West of Ireland have a price laid on them which ordinary speculators hesitate to give. It would not be difficult for the Tariff Commission to make out a case for the English or Irish producer. But what is needed is some authority suffi-

ciently powerful to prevail with railway and shipping companies and other carriers in order to obtain a suspension of prohibitive prices, at least until the marble industry has firmly established itself. If in the United States marbles can be used in nearly all kinds of buildings, it is hard that in England the material is employed only in exceptional cases.

Marble has the advantage of forming by itself an admirable wall decoration. Some people may consider it is suggestive of coldness and is unfitted for rooms used in winter. But marbles are to be obtained which are warm in colour, and which would not be repellent when the air outside is chilling. It is not necessary to assume that marble is an obstacle to painted decoration. An admirable example of the combination of the two is to be seen in the Sessions House, Old Bailey. Marble and painted decoration are also common enough in the large American hotels. One of the first attempts in this country at a similar union of art and nature was carried out under the auspices of Cardinal NEWMAN half a century ago. In the University Church he had erected in Dublin the lower part of the walls was lined with coloured Irish marbles, while for the upper part copies were obtained of the tapestries which RAPHAEL designed for the Sistine Chapel. The experiment, we believe, was successful, and a similar arrangement might be adopted in many places.

The word marble is supposed to be expressive of the shining qualities of the material. Although in our prosaic time marble is thought to be mainly applicable for decorative purposes, partly because it can be polished, it possesses real constructive value. Rome alone is able to offer about 6,000 ancient columns to the attention of the student, and nearly all of them have been doing work for more than a thousand years. But columns that would sustain heavy loads and are monoliths become costly, and if marble is not used for columns it is not likely to be adopted for lintels or as frames for doors and windows in modern buildings. We may therefore allow the ancients to surpass us in the use of marble for a variety of purposes. It has been the most precious of all materials for the architect and the sculptor. But while marble statues possess a character of their own which is not to be obtained by the use of bronze and *vice versa*, it cannot be said that marble has led to the creation of any architectural style. There is nothing in marble buildings which cannot be executed in stone of inferior value. Corinthian and other floriated caps have been successfully carved from stones that cannot be comprised among the varieties of marble. The nearest approach to original work will be found in the slabs and inlaying of some Italian Gothic churches. But the material is deserving of veneration when we consider the noble buildings and statues which were created from it. If PLINY's statement can be accepted, that the shepherd who discovered the marble quarries from which the materials of the temples of Ephesus were obtained was rewarded, we can admire the people who could value a material which lent itself to so many possibilities. If we remember that the ancient sculptors, by the process known as *circumlitio*, made a marble statue appear as if it were carved from fine ivory, we are able to understand why so much importance was attached to a material which was supposed to surpass bronze in its fitness for creating figures of gods and heroes.

Some of the districts from which Greeks and Romans derived their marbles are not yet exhausted. By using stone from those sources modern architects and sculptors unite themselves with the men who were so successful, and in that way a bond of union is formed which is entitled to respectful consideration. If one touch of nature can make the whole world kin, the admiration for the beautiful colours of marble or its subservience to the sculptor's hand reveals that men continue to have the same characteristics as their predecessors of an earlier time. Marble then succeeded as it could now if employed with a like knowledge of its qualities.

WHO IS A WORKMAN?

THE Workmen's Compensation Acts do not define the term "workman," and consequently cases from time to time arise as to the class of persons who are entitled to benefit under the Acts. It was decided in the case of *SIMPSON v. The Ebbw Vale Steel and Iron Company*—noted in *The Architect* for March 24, 1905—that the manager of a mine at a salary of 400*l.* a year, a house rent free, and coal who was not required to do any menial work was not a workman within the meaning of the Acts. The ground of the decision in that case was that the Acts used popular terms, and that those terms must be interpreted in a popular sense. The recent case of *BAGNALL v. LEVINSTEIN, LTD.*, raises a similar problem. In that case the deceased, for whose death compensation was claimed, had been educated at Manchester University and was a master of science. He entered the employment of the defendants, who were manufacturers of dyes and chemicals, for a period of five years, at a salary which began at 200*l.* and rose to 260*l.* He was to give all the results of his work to his employers, who were to pay him a commission of 4 per cent. on any inventions he made which they considered worth patenting. He was obliged to do certain manual labour in connection with some parts of his work, and while so engaged worked with the other workmen. For five-sixths of his time he was thus engaged. For one-sixth of his time he worked in the laboratory. He was paid monthly, but his name did not appear in the wages book. The Court of Appeal, COLLINS, M.R., and COZENS-HARDY, L.J., FARWELL, L.J., dissenting, held that the deceased was not a workman within the meaning of the Acts, and that his widow could not claim compensation. The Master of the Rolls pointed out that some attention should be paid to the purposes for which a person was employed. If a person was employed to bring his scientific knowledge to bear upon his employer's business, or to discover improvements in the scientific processes used in that business, the mere fact that he performed manual tasks in connection with his employment would not make him a workman. He was employed as a scientific expert, and not as a workman.

With the principle of this decision we entirely agree. Both this case and the earlier case noted above lay down clear rules as to who are not workmen. But these cases also make it quite evident that some statutory definition of a workman is needed. When we get a judge of the eminence of FARWELL, L.J., differing from his equally eminent brethren it is abundantly clear that the law is far too uncertain. In defining the workmen who come within the Acts we think that the Legislature would do well to consider the principle upon which this legislation rests. The Acts really provide a statutory insurance for workmen at the expense of the employer. This statutory insurance was confined originally to the more dangerous classes of employment. It has been gradually extended to classes of employment which cannot by any stretch of the imagination be called dangerous. We take it, therefore, that the Acts lay down the principle that persons who cannot be expected to insure themselves shall be insured by the employer. Now capacity to insure oneself depends upon the remuneration received, whether we call that remuneration wages or salary. We think that whether or no an employé is within the Acts should depend upon the amount of remuneration which he has received during a certain period, say, for instance, the past year or six months. We take it that no one will deny the truism that the State should encourage the virtues of thrift and self-reliance. A definition based upon this principle would tend to bring about this desirable result; for though we think that in many cases the principle of these Acts is just, because the employé does not earn enough to insure himself, we think that there are some cases in which they do harm, by removing from shoulders which could quite well bear it the duty of making an adequate provision for the risks of employment.

NEW BOOKS.

Building Contracts, Building Leases and Building Statutes. With Precedents of Building Leases and Contracts and other forms connected with Building, and the Statute Law relating to Building (including the London Building Acts, 1894-1905). With Notes and Cases under the various Sections, together with an Appendix of Unreported Cases. By His Honour Judge Emden. Fourth Edition by Joseph Bridges Matthews, of the Middle Temple and the Oxford Circuit, and W. Valentine Ball, of Lincoln's Inn and the North-Eastern Circuit, Barristers-at-Law. With a Glossary of Architectural and Building Terms, revised and extended by Maurice B. Adams, F.R.I.B.A. (London: Butterworth & Co. 27s. 6d.)

Building Cases. Being a Digest of reported Decisions affecting Architects, Surveyors, Builders and Building Owners. By F. St. John Morrow, LL.D. (Dub.), of the Inner Temple and the South-Eastern Circuit, Barrister-at-Law. (London: Butterworth & Co. 15s. net.)

WE have much pleasure in again recommending to the notice both of architects and lawyers the fourth edition of Judge EMDEN's well known book. It is invaluable alike to both professions, and the present edition will fully maintain the reputation which it has already acquired. The most recent cases are noted up and introduced into their appropriate places. In all cases, so far as we have observed, the gist of the decision is correctly given, and its effect upon the existing law accurately stated. Even upon subjects so thorny as prescription, covenants running with the lease at law and in equity, covenants by tenants to pay rates, taxes and other outgoings, the law is stated so clearly that a layman may gather many correct ideas upon these technical matters. The general principles of the law are stated with great completeness and clearness in the First Part, which occupies 370 pp. The only defect which we have noted is the omission of all mention of the Public Authorities Protection Act. We think that some mention of this and the cases thereon should be made in the next edition. It is a subject of quite as much importance to architects and builders who contract with public authorities as, for instance, the rules as to the requirement of a seal in contracts with corporations, with which the learned authors deal fully and adequately. Part II. of the book deals with forms and precedents, and Part III. contains the text of the London Building Acts, the various Metropolis Management Acts, the Public Health Act and the London County Council By-Laws. The Acts and the by-laws are accompanied by notes which refer to the cases in which their meaning has been judicially determined or discussed. The glossary of architectural terms and the list of unreported cases is very complete, and should be of great service to lawyers.

The second of the books which stands at the head of this article contains a collection of cases dealing with architectural and building subjects, arranged under alphabetical headings. It contains also an appendix which comprises (1) a form of agreement and schedule of conditions for building contracts, (2) the professional practice approved by the Royal Institute of Architects as to the charges of architects, and (3) RYDE's scale of surveyor's fees. The list of subjects with which the cases deal is by no means exhaustive. There are no cases upon the subjects of the mortgagee's right to tack or to consolidate, nor upon the tenant's covenant to pay rates, &c., nor upon covenants running with the land. Sometimes cases are not placed in the order which we should expect to see them. Then we should have expected to find the case of *LAWFORD v. Billericay Rural District Council* under the head of "Contract not under Seal." Instead it appears under the head "Executed Consideration." Sometimes one case is inserted upon a subject which, if it was to be illustrated at all, should be illustrated by several cases. Thus at page 287 we have one inconclusive case upon a petition of right. The subject, if it appeared at all, should have been illus-

trated by cases which clearly pointed out the scope of this remedy. There are, in fact, several cases more recent than the one cited which might have appeared. The cases which appear are on the whole accurately summarised; and, though we think that both the topics selected and the cases to illustrate those topics have been chosen with too little system, we think that the digest will be useful to lawyers who cannot consult the regular reports. The book could be improved if the cases were arranged under more general headings, and if a few more subjects were included. This could easily be done without increasing the size of the volume if the appendix were omitted. A really complete digest, summarised as in this book, would be very useful to both lawyers and laymen.

Writers are fortunate who can have their books introduced among Messrs. GRIFFIN's standard publications, for the majority of the technical volumes published by the company have to be reprinted several times. Great care is of course exercised in the selection. We have now before us the thirteenth edition of Dr. GEORGE REID's "Practical Sanitation: A Handbook for Sanitary Inspectors and others interested in Sanitation," to which an appendix on sanitary law has been added by Mr. HERBERT MANLEY. The authors have had experience as medical officers of health, and what they say about requirements and about what should be avoided can be accepted with confidence. The information is conveyed in such simple language the pages can be understood by others besides officials, and the volume is well deserving of the attention of the owners of property.

"Painters' Colours, Oils and Varnishes," a practical manual by Mr. T. H. HURST, is another volume from Messrs. CHARLES GRIFFIN & Co., Ltd. It is a fourth edition of a comprehensive treatise, and has been derived in a large measure from the author's experience as a specialist. Mr. HURST describes the latest processes in the manufacture of colours and compares them when necessary with those of an earlier time. The comments on colours will be found useful by contractors. Thus of zinc white he says:—"Charlton white is an excellent substitute for white lead; its colour is good, its body is superior to that of white lead; in well-made samples it has about twice the colouring power, while it possesses the advantages of not being discoloured by sulphuretted hydrogen, by sulphur gases or pigments, and of being non-poisonous. It mixes well with all vehicles, so that it may be used for all kinds of painting with good results." The author treats not only of pigments but of vehicles, driers and varnishes, and on all the subjects he supplies valuable information.

Under the title "Apollo" a new edition has been published by Mr. HEINEMANN of the lectures delivered by M. S. REINACH, of the French Institut, on the history of art throughout the ages. It may be compared to a careful map of the world or the pocket-books which are adapted for the use of students of various sciences, and who wish to have laws expressed by formulæ. The six hundred illustrations are mainly reproductions of photographs, and clearly suggest the character of typical works of art, from the incised figures on bones of the cave-dwellers to M. BARTHOLOMÉ's expressive "Monument to the Dead." The author is no compiler. He expresses his own opinions about the value of the works, and often offers novel suggestions, as when he says that the Venus of Melos probably represents AMPHITRITE, and held a trident in the extended left arm. One remarkable feature is the bibliography. "Apollo" should be the constant companion of all students of art, for it is an encyclopædia in a small way.

ANTONY AND CLEOPATRA.

THERE is still discussion among playgoers about the accuracy of the costumes and buildings introduced in "Antony and Cleopatra" at His Majesty's Theatre. The following article by the late Edward W. Godwin will suggest that he had considered both sides of the question concerning the influence of Hellenism in Egypt:—

The Rome of the time of Antony would be in every respect much the same as the Rome of Julius Cæsar. The difference in date between the two stories is only a very few years. Indeed Antony and Cleopatra may be taken as a continuation of Julius Cæsar. The latter play ended with the fall of Brutus at the battle of Philippi, B.C. 42. The other tragedy begins with the death of Flavia, B.C. 40, and concludes with the death of Cleopatra, B.C. 30. The last of the Ptolemies, passionate and animal as she was, seems to have been no worse than were many members of her distinguished family before her. The legitimate dynasty became extinct on the death of Ptolemy Alexander II. But Alexander had a natural brother—one Dionysius Auletes—who, after much trouble, secured for himself the throne of Egypt, leaving it to his eldest child—the Cleopatra of the drama—who was born B.C. 68. There had been already four generations of Kleopatras. The first was a Syrian princess, who was married to Ptolemy Epiphanes, and who bore him two sons and two daughters, both of the latter being named after their mother. One of these girls was taken to wife by her brothers in succession and had a family by each, the eldest son of the youngest brother being Ptolemy Soter II., the grandfather of our Kleopatra.

In the tragedy before us we have no less than thirty-six scenes. Of these twenty-five are architectural, including the one on board Pompey's galley, which belongs to naval architecture. The other twenty-four are divided between Alexandria, Rome, Messina and Athens, or the respective residences of Cleopatra, Cæsar, Pompeius and Antonius, but by far the most important of these are those which belong to the city of the Ptolemies. It is next to impossible to reduce this play to set scenes, for the unities of time and place are quite disregarded by the author. In the first and last Acts a very slight change would enable us to bring these into two scenes, if the fourth Scene of the first Act were carried on to the second Act and the first Scene of the fifth Act omitted, but the second Act carries us in seven scenes from Pompey's house at Messina to the house of Lepidus at Rome, thence into Cæsar's palace, thence into the streets of Rome, thence to the palace at Alexandria, thence to Misenum, and finally leaves us floating on the sea. In the third Act (eleven scenes) we are in Alexandria, Rome and Athens; now on the plains of Syria and now on the promontory of Actium. In the fourth Act of thirteen scenes we are certainly confined to Alexandria and its neighbourhood, but we are perpetually moved about from the inside of the palace to the outside, from within to without the walls, from one camp to the other, until we are brought to rest in that remarkable scene—"the monument." I see no reason why the scene in the house of Lepidus (Act ii. Scene 2), should not be laid in a lesche or under a colonnade before Cæsar's house, and thus serve also for the two scenes which follow it. Indeed, by the exercise of some little thought and care, the whole number of the architectural scenes may be fairly reduced, and it is possible without serious mutilation to prevent some of the abrupt changes, as for example that brought about by the introduction of Alexandria in the fifth Scene of the second Act; for there does not exist, as it seems to me, any great obstacle to this scene forming part of the third in the third Act. I cannot at present see that we can do with less architectural scenery than that set down in the following list, unless the scenes at Athens and Messina are omitted altogether:—

1. The palace at Alexandria—interior.
2. A monument at Alexandria.
3. Cæsar's house at Rome—a lesche or colonnade.
4. Antony's house at Athens—interior.
5. Pompey's house at Messina—interior.

Of the interior of Cleopatra's palace the play presents us with no less than twelve scenes, and with one laid outside or before the palace (Act i. Scene 3), but all thirteen could reasonably pass in one hall if attention was given to the planning of it. The remains of the temples at Philæ, Dendera and Kalabsche, the relic of the palace at Medinet Habou and the representations of domestic architecture in the fragments of wall-paintings in our museums are the only authorities available for this important scene, for what is left of the old city of Alexandria is little more than an inchoate mass of ruin. The temples and palace, however,

that I have just mentioned must be held to be far inferior to the temples and palaces of the royal city. A city founded by such a man as Alexander, and that, too, for his favourite natural brother; a city whose chief street was 100 feet wide and nearly four miles long, whose geographical position was such as to command the commerce of the known world; a city where the last dynasty of Egypt's kings resided for nearly three centuries, where one Ptolemy devoted his powers to the advancement of art and science by originating and devising educational schemes—schemes that would put to shame the largest efforts of modern governments; where another Ptolemy carried these designs into noblest execution by the establishment, among other things, of a museum—school and a library that were among the wonders of the world; a court where Euclid and Nicomachus, Antiphrilos and Apelles were by no means remarkable men; a city where the Aryan and the Semitic nations were united, where the Egyptian, the Jew and the Greek met, as it were, on a level platform—was not a place where architecture or any other art would be likely to be underrated. The picturesque irregularity visible in the work at Philæ must not, however, be taken as applicable to the palace of the Ptolemies at Alexandria. That the spirit of Greek freedom—that freedom without which the Propylea would never have been—might have struck root in Alexandria is more than probable, but the day of freedom, of original art-thought was already far spent; law was taking the place of feeling; geometry was being substituted for the eye; instead of ideas being created facts were collated; the beautiful was reduced to a system and art was made science. The evidence of material wealth—a splendour lavish as daylight—would be there. Whatever marble and basalt, porphyry and serpentine, bronze or silver or gold, or any other precious material could do we may be quite sure was not lacking. Mechanics would shine like the sun in construction; multitudes of pillars, and miles of avenue and corridor and labyrinth would speak of the mighty mass of labour in the service of Egypt; but the creative art power had passed its meridian a full century before the city was founded, and quite two centuries before the Ptolemies began the objectionable practice of marrying their own sisters.†

The "monument" of the play is evidently nothing more than the raised stage at the back of the main stage, so common in the theatres of Shakespeare's time. An Egyptian monument or tomb was constructed on principles which could not possibly admit the poet's idea. But the Greek monument was altogether different. In the one case we find a tomb, an architectural grave, a sepulchre; in the other we have a house, a shrine, a temple. The little memorial of Lysicrates at Athens, and the temple-like Lycian monument discovered at Xanthus, and now in our National Museum, are extreme illustrations of one principle of design. In both the structure consists of two storeys; the ground storey solid and comparatively plain, the upper storey open and enriched with columns, figure sculpture and other ornamental accessories. Now, although acting on a higher platform than the stage is always made to look more or less ridiculous by modern scenic arrangements, in proof of which assertion I may cite Juliet's balcony as a flagrant example, and although I know of no instance where this division of stage level has been well carried out, yet even in the Veronese and Venetian plays there is no room for reasonable excuse if the scene results in failure; still less in the play under consideration should the acting suffer, inasmuch as the area of the monument of Egypt's queen may be of almost any size. In its architecture, as compared with that of the palace, there might well be marked the vast difference between the arts under the first Ptolemies, when the *Aphrodite Anadyomene* was painted, and the low condition to which 150 years of rapid decline had brought them, when the last of the Macedonian dynasty ascended the throne.

Our third Scene—Cæsar's house at Rome—needs no further description than what has already been given in the notes on Julius Cæsar. Antony's house at Athens might be one of the old Greek houses or palaces, with its double arrangement of Andronitis and Gynaecitis, or the men's and women's quarters. The fourth and fifth Scenes of the third Act introduce us to two rooms in this house, but there is no reason why one interior should not suffice for

* Arsinoë, one of the concubines of Philip of Macedonia, was pregnant with the child afterwards known as Ptolemy I., surnamed Soter, when she married Lagus.

† Ptolemy, the big-belly (146-17), not only married his sister, and this too after she had become his brother's widow, but divorced her in order to marry her daughter by his brother.

both scenes if the proper room be selected, which I take it should be the pillared hall (*aule*) of the Andronitis, which in a Greek house occupies the place of the Roman atrium. The floor might be of mosaic, whilst both the ceiling and walls might be painted. Pompey's house at Messina, or Messina, might be either Roman or Greek, or half and half. The old Greek city was destroyed by the Carthaginians in B.C. 396, but Dionysius, tyrant of Syracuse, at once rebuilt it, so that its buildings were well seasoned—neither too new nor yet too old—when the Romans came into possession after the First Punic War, B.C. 240.

The *Costume* of this play may be taken to be somewhat mixed. That the Roman fashions were for the most part accepted wherever the power of Rome had made itself a reality may be safely assumed, but then these fashions were themselves moulded on those of other nations. Nor was this spirit of imitation or copyism altogether confined to the people by the banks of the Tiber. It is said of the great Alexander that, after his Persian conquests, becoming partial to some of the things he saw in Asia, and desiring to make himself popular with his new subjects, he actually assumed the Persian habit and adopted many of their customs. Everyone knows that the Romans followed his example in regard to Greece with a sort of alacrity which was at times almost amusing. But fashion, in old as in modern times, belongs to the upper classes, so that while I have little hesitation in clothing Kleopatra and her court in the habit, or some slight modification of the habit, prevalent among Greeks—more or less adopted also by the Roman aristocracy—the poor people, the clown especially, and perhaps the soothsayer, might very well exhibit in their dress some tradition of the old nation to which they belonged.* The Ionic chiton, the chlamys, the peplos, the transparent fine-linen vest, chemise or under tunic were dresses which obtained throughout the shores of the Mediterranean with but little variation beyond that resulting from increase or decrease in length or breadth of material. No doubt, too, the fashionable ladies of Alexandria had their parasols or umbracula just the same as the ladies of Athens, Rome or Pompeii. Broad-brimmed straw hats, with low, saucer-shaped crowns, were also probably worn. Octavia, after her marriage, might appear in the stola and the square-cut white pallium, fastened with a fibula or brooch on the right shoulder, leaving the right arm free. For the details of the costume for this play it will be sufficient to refer to the marbles and bronzes in the British Museum. Among the references to costume in the text of (1) Julius Cæsar and (2) Antony and Cleopatra we may find mention made of (1) leather aprons, crowns, coronets, doublets, cloaks, kerchiefs, nightgowns, dressing-gowns, with pockets, spurs; (2) the points of a doublet, crowns, "crownets" and pockets. In Julius Cæsar the architectural passages are few and slight—

— Many a time and oft
Have you climb'd up to walls and battlements,
To towers and windows, yea to chimney-tops,
&c., &c.

Mention is also made of stone towers and walls of beaten brass, and there are references to buildings and places in Rome, e.g. Pompey's porch, Pompey's theatre, the statues of "Old Brutus" and Pompey, images decked with ceremonies or hung with trophies, public pulpits, and Cæsar's walks, arbours and orchards. In Antony and Cleopatra there is not one word about architecture or building, but then we have a description of the Queen's barge, which was all overlaid with gold and "like a burnish'd throne burnt on the water;" its poop was of beaten or *repoussé* gold, its sails were purple and perfumed, the tackle of silk, the oars of silver, and the pavilion or canopy of dais which shadowed the rare Egyptian was cloth of gold of tissue. If a throne was wanted in the market-place for the serpent of old Nile and her lover it was got by setting chairs of gold upon a platform of silver—"a tribunal silver'd." Shakespeare's idea of Kleopatra's person may be gathered from a few scattered expressions. According to the poet she was of a dark or tawny complexion; the words he puts into her own mouth would even go so far as to make her black and wrinkled:—

— Think on me,
That am with Phœbus' amorous pinches black,
And wrinkled deep in time?

* The queen, according to the text, which follows history in this particular, appeared often "in the habiliments of the goddess Isis"—the goddess of the moon; in other words, in a long, transparent, fine linen tunic, and a pallium fastened by a knot in front, a crown of lotus flowers on her head, and a sistrum in her hand.

Allowing for the exaggerated language of the woman, we must still, I think, conclude that her charms were not to be found in beauty such as Pericles or Phidias delighted in. She was old, very old for Egypt; but even the rough soldier, Enobarbus, says that "age cannot wither her nor custom stale her infinite variety." Not in measured beauty of form or face, but rather in the serpentine or undulating movements of her body, in the changing *expressions* of her full-lipped wavy mouth and large dark eyes, in her expansive brow—a feature not so much admired now as in Shakespeare's time; above all, in her wit must we seek for the strange witchery she exercised over Julius Cæsar and Mark Antony.

CAEN STONE.

ANOTHER letter from Mr. W. D. Caröe respecting the decay of Canterbury Cathedral through coal smoke has appeared in the *Times*. Among the remarks are the following:—

Every expert in masonry is alive to the evil of face-bedding. In some qualities of stone the results are much more serious than in others, and Caen stone is by no means the worst of them. Unfortunately it is not the case that the Mediæval builders were careful to avoid face-bedding. Technically skilful as their masons were in the manipulation of stone, they were singularly careless, or often, I believe, ignorant in this important particular. It is also a pure fiction that the Angel Tower at Canterbury was largely erected out of reused material. A few of the Norman stones were reused at its base, below the level of the cathedral roofs. The rest was entirely constructed externally of new stone. The outcome is that certain portions of the stonework are indubitably face-bedded, and some decay is due to this fact.

But the general and recent rapid decay and the special condition to which I referred in my previous letter have nothing whatever to do with face-bedding. The fact that stone which has stood in a purer atmosphere for hundreds of years is now beginning rapidly to disintegrate owing to a definite chemical change in its structure would seem to afford evidence enough of some fresh stress to convince the most incredulous. Chemical analysis proves to the hilt that the fresh stress is coal smoke. Obviously, face-bedded stone, being the more tender, is generally the first to give way to such adverse influences; but even so, some of the face-bedded stone is in better condition than some of the other. The sporadic character of the decay depends upon the quality of each stone and its original position in the quarry. The long transport would naturally tend to mix up the stones from different parts of the quarry.

It is interesting that not only at Canterbury, but elsewhere, the Caen stone used by the Normans was of superior quality to that imported later; in fact, at Canterbury it may be accepted as a general rule that the older the Caen stone the better its quality and condition. Of Lanfranc's stonework there is not, regrettably, much left to us, but what there is happens to be fairly well protected. Yet after 800 years of sturdy existence, mostly in the purer air of the past, it is showing signs of giving way to modern conditions. It should be understood that good stone once set to the weather may erode (as, typically, at Stonehenge) under long exposure. It will not decay, after a long life, except under fresh influences.

We have, then, to face the disagreeable fact that if the Angel Tower were standing in the open country it would remain to us nearly as perfect as it was when Goldstone fixed the last stone in 1503, and much more beautiful—mellowed by the clean hand of Time and by the slight and soft erosion of some of the face-bedded masonry.

WOLVERHAMPTON ASSOCIATION.

THE annual meeting of the Wolverhampton and District Architectural Association was held last Friday evening, at the Law Library, Lych Gates, when the officers for the ensuing year were elected as follows:—Mr. William Edwards, president; Mr. William J. Oliver, M.S.A., vice-president; Messrs. Fred. T. Beck (past president), Joseph Lavender (past president) and T. H. Fleeming, members of the Council. The following officers were re-elected:—Mr. J. Harrison Weller, hon. treasurer; Mr. A. Eaton Painter, hon. auditor; and Mr. William J. Oliver, 1 Darlington Street, hon. secretary. The retiring president, Mr. F. T. Beck, who has held that office during the past three years, later in the evening read a paper which was appreciated by the members.

NOTES AND COMMENTS.

WE have already pointed out (see *The Architect* for November 23, 1906, p. 335) that the law as to what is such serious and wilful misconduct as will debar a workman or his representatives from his or their right to compensation is in a by no means satisfactory state. The need for some further definition is illustrated by the recent case of *BROOKER v. WARREN*. In that case a workman was employed in working at a circular saw. Both his employer and the factory inspector told him to keep the guard on the saw when it was in use. In defiance of their orders he declined to do so and was killed in consequence. Yet, in spite of this, the County Court Judge held that he had not been guilty of such serious and wilful misconduct as would disentitle his widow to compensation. The Court of Appeal reversed this decision. As the Master of the Rolls said, it would be difficult to imagine a clearer case of serious and wilful misconduct. The point which we wish to emphasise is the glorious uncertainty which must attach to the phrase "serious and wilful misconduct," if it is possible for anyone—even a County Court Judge—to suppose that such misconduct was not present in this case.

THE summer meetings and excursions of the Royal Society of Antiquaries of Ireland are held in rotation in the four provinces. This year it is the turn of Connaught. The Urban District Council of Athlone have formally invited the Society to meet there in the last week of June or the first week in July. The town is only partly in Connaught. It is explained that several excursions could be arranged from Athlone—two days by steamer—the first to visit the interesting ruins on the islands in Lough Ree, the second day down the Shannon to Clonmacnoise; a visit could be paid to Roscommon to examine the castle and abbey, and a day could be spent in Athlone visiting the ancient castle and town walls, with an afternoon drive to "Auburn" and GOLD-SMITH'S country. During 1906 the number of Fellows and members has decreased from 1,232 to 1,197. Four Fellows and forty-three members joined the Society last year. An effort was made to obtain from the Department of Agriculture and Technical Instruction accommodation for meetings and other business in the new College of Science. The use of a lecture-room was offered, but rooms for permanent occupation could not be given. The lease of the Society's hall and offices expires in 1912.

THE paper read at the first meeting of the session of the Applied Art Section of the Society of Arts was "Basket-making," by Mr. THOMAS OKEY. In these pessimistic days it is satisfactory to find a man who is proud of his craft. He claimed that it was not only important in itself, it has been the cause of greatness in other crafts. It was the parent of all the textile arts, for basketwork is literally a weaving process. The willow pattern in old china, the basket capitals and braided mouldings in Byzantine architecture are derived from basketwork, and the curious patterns found on some old ceramic ware have been traced to the marks left on the clay by the basket mould which was in use before the invention of the potter's wheel, and to this day wicker shapes are used by the Japanese for their vessels of lacquer ware. The earlier settlers in Rome and in Western Europe generally constructed their houses of osierwork plastered with clay, and they raised their defensive walls of the same material. From a letter of CASSIODORUS we learn that in the early sixth century the Venetians opposed a dyke of twisted and knotted osiers to the devouring fury of the waves. Mr. OKEY might have referred to the theory of the late WILLIAM SIMPSON, the artist, who was engaged in war expeditions, but who found opportunities to investigate relics of ancient architecture. From what he saw in

the East he came to the conclusion that the dome, although it is supposed to be a late development of architecture, originated with primitive people who made huts by first setting up osiers or willows around a circular plan, and then bending the uprights together at the top, when they formed an enclosure which might well have suggested the dome. He said that the Romans found osier boats in Britain. But coracles are still known on the west coast of Ireland and in the neighbouring islands. It might also be mentioned that Sir WALTER SCOTT believed in HALL's theory that Gothic tracery was no more than an imitation of the work of the basket-maker.

It is a remarkable coincidence that the Manchester and district branch of the Classical Association should be able to find an interesting subject for investigation without going beyond Cottonopolis. It is also remarkable that until Christmas last there existed half an acre of ground in the city which had not been opened by a builder since the time of the Romans. The excavation committee have been allowed to operate on the spot until April 10. It cannot be said that any startling discoveries have rewarded the labours of the explorers. But there is no doubt that if the work is carried out systematically it will help to define the limits of the ancient Mancunium. Very little is known concerning the station. It was generally supposed that the Romans had only erected buildings needed for military occupation. Whether the remains on the site in Duke Place are those of a big barrack has to be ascertained, and it will be discreditable to so wealthy a city if the 300% cannot be obtained.

HAMPDEN PARK HOTEL.

THIS building has been erected for the Public-House Trust Company at Hampden Park, a growing district about two and a half miles inland from Eastbourne, and is one of the 210 houses in the United Kingdom in which Earl GREY'S scheme of public-house reform is being carried on by the thirty-eight county trust companies formed for that purpose. Simplicity of design and homely comfort, with the various rooms and the entrances planned in such a way as will enable the manager to exercise complete control and supervision over all parts, are essential features here as they are in all Trust houses. The accommodation provided on the ground floor consists of a large general bar with ingle-nook, jug bar, tap-room, parlour and tea-room, with access to the extensive grounds and gardens. The manager's office, kitchen and usual offices are conveniently arranged in connection. On the first floor there is a large club-room, a ladies' tea-room with separate retiring-room, three bedrooms for letting to visitors, bath-room, &c. On the attic are the bedrooms of the manager and staff. Ample cellarage and storage are provided in the basement. Lavatory and sanitary accommodation are provided on each floor. There is arranged around a spacious yard adjoining a three-stall stable with coach-house, harness-room and store, also a large motor-shed with pit and acetylene generating house and store. This new license was obtained at the last brewster sessions to serve a residential district that had no license. The walls have been built hollow with local bricks, the upper part finished with rough-cast and half timber. The roofs are covered with Broseley tiles. The stone was Doulling. The general contractor was Mr. JOHN WHITE, of Eastbourne; the acetylene installation and the fittings were executed by LOCKERBIE & WILKINSON, and the architect was Mr. J. DOUGLAS SCOTT, A.R.I.B.A., of 23 Bedford Row, W.C.

BOROUGH OF GLOSSOP PROPOSED CONVALESCENT AND NURSES' HOME.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. T. E. Colcutt, president, in the chair.

Mr. ALEXANDER GRAHAM (hon. secretary) said those members who had read in the *Times* that morning the announcement of the death of Lieutenant-Colonel Lenox Prendergast must have felt that they had lost an old friend and a kind well-wisher of the Institute. Elected as honorary Associate in 1878, Colonel Prendergast evinced a very lively interest in their work, and when the Institute established standing committees he was one of the first to serve on the literature committee, and as a member of it he showed his knowledge of architecture and a desire to extend the usefulness of their library, more particularly towards Classical revivalism, of which he was an earnest student. The speaker said that in attending the Institute meetings the deceased not only showed appreciation of their work but he was always ready to take an active part in their discussions. Mr. Graham moved that a letter of condolence be sent to the widow and family of Lieutenant-Colonel Prendergast, in which they should express their full appreciation of the interest he took in their work, and his endeavours at all times wherever he was to encourage the study of architecture as one of the fine arts.

Sir L. ALMA-TADEMA, O.M., R.A., and Mr. WILLIAM BRINDLEY read papers on

Marbles: Their Ancient and Modern Application.

Sir L. ALMA-TADEMA, discussing the earliest use of marble in buildings, said that, setting aside the sculptured slabs at Nineveh, he had been unable to discover where marble was first used for decoration. Judging from the discoveries at Pompeii its use went back to great antiquity. In the house of Salustius many painted imitations of marble slabs and dados are to be seen. Very precious marbles were put to common use in Pompeii. He had found in quite ordinary houses bronze door-sockets let into rough blocks of Oriental alabaster, evidently remnants of a marble-mason's workshop. The only marble columns he recollected in Pompeii were some unfinished ones in the new bath which was being built when the town was buried, and some in the Temple of Venus and Rome, also in course of erection. He remembered only one marble public fountain in the streets of Pompeii, the one behind the oldest bath; but the sculptured heads for the outlet of the water are more often in that material. The floors are mostly of marble, either slabs or mosaic, and many impluviums in the richer houses are covered with white marbles, as are some of the altars and pedestals in and near the Forum. One of the finest bits of marble in Pompeii was the door-frame of the house of Eumachia, now in the Naples Museum. In Pompeii marble was also largely used for funeral monuments, but always as a veneer over brick or concrete, proving that it was a costly material. The Romans obtained great dexterity in applying thin slabs of marble, and saved the material itself greatly. This way of utilising marble had a considerable influence upon the form of the mouldings, in most instances the slabs being applied to the bed of cement in such inclination as the body of the moulding required, the moulding becoming subservient to the thickness of the slab. In Rome, during the Republic, marble was most luxuriously used. Julius Caesar found a successful way of replenishing the Treasury by levying a tax on marble columns. The author cited some descriptions in Mazois's *Palace of Scæurus* to illustrate the luxury of marble in Rome at the end of the Republic, and went on to quote Lanciani's description of the landing-stage for marble near the Campus Martius, built in the reign of Augustus, and discovered some twenty years ago when the course of the river was being rectified. Wealthy patricians and personal friends of Augustus covered the Campus Martius with colossal constructions of marble. Having referred to the painting of their marble buildings by the Greeks and Etruscans, the author stated that marble found its highest development, perhaps, in Byzantine architecture, when painting was replaced by mosaic and when colour reigned supreme; then the outside of the buildings had become severe and simple and the richness of days gone by found its place in the interior. In the best times of Roman architecture those overwrought Corinthian capitals and cornices with undercutting and overcarving look more like lacework than architecture, and make us wonder. They are a marvel of workmanship and must have been effective in the Italian sunshine; the white marble being transparent the shadows

became warmed by light as well as by reflection. When used for interior work nothing is finer, nothing more precious, nothing more wonderful than a well-adjusted and well-disposed marble decoration. It is so clean and bright, so solid and never harsh or unpleasant, provided it be applied by a man of taste.

Mr. WM. BRINDLEY in his paper treated of the modern aspect of marblework in architecture, lamenting the fact that the bulk of the money spent in marble in this country should go to foreign manufacturers and workmen. We have in this country many excellent marbles, and if it were not for foreign competition, with cheap labour and low freights, against our high railway rates, many of the marble rocks now dormant would be worked to the advantage of the land proprietors and the workmen. The ability of the Greeks to work marble seems to run in the blood; they cut it with as much ease and freedom as masons here do soft stone. They execute long fluted columns from blocks lying on the ground, with no more setting out than a circle described at each end. They are now equally good at quarrying. All this skill has been acquired within the last generation. Dealing with the sources of supply, the author said that the produce of white marble at Carrara almost supplies the civilised world. The ancient quarries of verde antico in Thessaly are turning out immense quantities of splendid sound material of every kind that is to be found in the old buildings of Rome and Constantinople. Of late years many important monoliths have been quarried and used in England—blocks can be got as large as those used in St. Sophia, Constantinople. The old Carystian quarries of cipollino, on the island of Eubœa, have produced during the last few years over a hundred monoliths of large size. The noblest coloured marble the world has ever known (imperial Egyptian porphyry of Mons Porphyrites) remains unworked. There is any amount of material remaining, and the author offered all the assistance in his power to anyone having an honest desire to rework these unique quarries.

Coming to present-day uses of marble, the author said that within the last few years a large number of coloured monoliths, extracted from at least eighteen different quarries, have been used in important buildings, chiefly by Fellows of the Institute. When selected and appropriately used as supporting columns they have the same impressive dignity as those remaining in Rome, Constantinople, &c. Monoliths of rich marble used as architraves in large doorways or openings are always effective. Where boldly figured marble is used, the mason's horizontal joint sometimes destroys the continuance of the coloured pattern. The author suggested the adoption of mitre-jointing in such cases, and in small works like mouldings round panels in monuments fixed on a slab.

As regards the erection in London of buildings in white marble, if cost is no consideration, there is no difficulty, for the marble would then be used as any good building stone; and if the material is properly selected the work would be as lasting. If economy is desired, the Italian method of built brickwork, with marble slab casing, is a good one. The slab for bond and surface need not be more than 3 inches thick, and even less will make good, durable work by using ashlar courses—say, of 12 or 15 inches high—slightly projected, over 3-inch bond courses. Another method for a good town house would be a brick building with white marble facing in which plaques of porphyry and colour were inserted. For marblework in London simple mouldings would save cost; small detail soon gets filled with soot. Cleaning of marble buildings must be done with caution; two or three methods now in use destroy the silicified surface, which is a preservative.

Discussing pavements, the author said the demand has so increased that it now pays to manufacture them out of block slab. There is much demand for tiles about a foot square or more of verde antico, Greek cipollino and breccias. A pattern made with either of these and white is effective. A white or a black tile floor of different shapes forming a pattern by jointing only always makes a quiet, effective floor.

Thin tiles of marble can be prepared for walls, to be used for the same purpose as encaustic ones are now used, and fixed by ordinary workmen in the usual way. Stone staircases to dark offices would be improved by white risers of tiles or slips of marble.

The author suggested some improvement in the design and treatment of marble chimney-pieces and fenders, and went on to sketch the employment of marble in sepulchral art and memorial monuments from Greek times down to

the present day. Many good monuments have been designed by architects and appropriately thought out to fit them unobtrusively for the buildings in which they have been placed. The author expressed regret that this country imports annually thousands of tons of ready-made monuments in marble and granite for cemeteries and churchyards, most of them void of artistic character of any sort.

The present advance in the use of marble as a decorative material for important buildings may be considered to have commenced about thirty-five years ago with the building of M. Garnier's Paris Opera House. The marble decoration of this edifice is still one of the sights of that city.

Discussing English work in Purbeck and other marbles belonging to the country, the author said that our English alabaster is a very useful material for interior decorative work, but it should not be used where it would be exposed to a heat of over 200 degrees Fahr. It is especially adapted for the walls and operating-rooms of hospitals, as it is not acted upon by ordinary acids. As examples of very successful marble wall-linings, Sir L. Alma-Tadema's studio was cited, and the beautiful church of Charlemagne, at Aix-la-Chapelle, really cased with marble and exceptionally well done, being covered all over with slabs of light-coloured cipollino in the handsomest way imaginable.

The author considered that marble was now being used in architecture in a broader and more dignified manner than was generally done thirty years ago. The nearer we keep to working as the Romans did, with as few colours as possible, the healthier will be the effect obtained. Young men should make notes of marble colour combination they see, not only of old work but of new, if only to know what to avoid.

Mr. J. J. BURNET, having been asked to propose a vote of thanks to the authors of the two papers, said the task of replying to what Sir Alma-Tadema had enabled them to enjoy required greater erudition than he would lay claim to. However, he said, he would plead second to none in his admiration of the skill and affection Sir Lawrence Alma-Tadema had shown for the material they had been considering, and, indeed, for all marblework. Mr. Burnet said he was sorry he was not prepared to say more than a few words on the subject of the two papers, but he was proud to voice the feelings of the meeting and express their thanks. In one respect the papers had increased the burden of an architect's professional responsibilities, since he would in future have to more carefully consider the beauty of marbles with innumerable markings, their decorative treatment and an infinite number of other materials.

Mr. H. STANNUS seconded the vote of thanks, and said he would suggest that the treatment of marbles might be divided into two branches. Firstly, marble would be valued as a rather fine stone, and its use could be exemplified by the wonderful sculptures of the past. Secondly, it might be considered in a decorative sense. In the first would be found the monochrome marbles, but when, as in the second division, they were engaged with coloured marbles, there nature had added the colour decoration of the material and with so much variety as would not allow any other decorative treatment to be applied. It was because of this that the remark made by Mr. Brindley against the fluting of variegated columns had his entire sympathy. Sir Lawrence Alma-Tadema had spoken about the Roman use of marble veneer, and Mr. Stannus said he was reminded of some examples in Roman temples, notably the great Temple of Castor and Pollux. The speaker congratulated Mr. Brindley on his success in re-working the fine old marble quarries of the ancient world, and placing as it were great riches at the feet of the architect, who had only to enter in and possess them. In the question of the use of marbles, said Mr. Stannus, one would have to embark upon a treatise on colour decoration almost, and this was outside the limits of the meeting. In their lifetime they had seen a wonderful development in the use of marbles in their principal buildings, the material replacing details that formerly had been constructed of wood. It would seem that the demand for the material had brought the supply, and it was to such men as Mr. Brindley and Sir Lawrence Alma-Tadema, who had spread abroad the taste for marble, that they were indebted for its introduction.

Mr. A. H. REID, of Cape Town, supported the vote of thanks, and testified to the interest that was taken in the proceedings of the Institute by architects practising in the Colonies. He said he could not say much that was appropriate to the papers they had heard that evening, coming

as he did from a country which engaged mostly in digging for gold and the importing of slaves. There was, however, in Africa an aboriginal art confined purely and simply to stone, and curious to relate, the races which produced that art were now extinct, but evidence of their attainments was seen in the work that remained at Zimbabwe, in Northern Rhodesia.

THE PRESIDENT, in some concluding remarks, said that as marble was being greatly used in modern buildings he wished to draw attention to the mistake that was often made in polishing it. In the great majority of cases marbles would lose their quality by high polishing, and there were certain varieties which were better without any polish at all.

Prizes and Studentships, 1906.

The Council's deed of award made under seal pursuant to by-law 66, and read at the meeting, states that the Council have examined the works submitted for the Institute silver medals, the Soane medallion, the Owen Jones and Pugin studentships, the Godwin bursary, the Tite prize, the Arthur Cates prize and the Grissell gold medal, and gives particulars of the competitions and the results thereof as follows:—

THE ROYAL INSTITUTE SILVER MEDALS—THE ESSAY MEDAL AND 25 GUINEAS.

Six essays on "The Influence of the Use of Iron and Steel on Modern Architectural Design" were received.

The Council have awarded the medal and 25 guineas to the author of the essay submitted under motto "Three Ages" (Mr. Victor D. Horsburgh, 23 Rutland Square, Edinburgh); a certificate of honourable mention to the author of the essay bearing the motto "Fonte" (Mr. A. Halcrow Verstage, of Godalming).

THE MEASURED DRAWINGS—MEDAL AND 10 GUINEAS.

Six sets of drawings were sent in of the various buildings indicated. The Council have not awarded the medal but give certificates of honourable mention to the delineators of Stoke Castle, Shropshire, and Magdalen College, Oxford, submitted under the mottoes "Swallow" (Mr. David Robertson, Huntley Terrace, Kelvinside, Glasgow), and "Waynflete" (Mr. R. Wynn Owen, 60 Castle Street, Liverpool).

THE TRAVELLING STUDENTSHIPS—THE SOANE MEDALLION AND 100/.

Fifteen designs for a large city hotel facing a public square were submitted. The Council have awarded the medallion and (subject to the specified conditions) the sum of 100/ to the author of the design bearing the motto "Cameo" (Mr. Harold Cooper, 21 Oakley Crescent, Chelsea), and certificates of honourable mention to the authors of the designs bearing the mottoes "Simplex" (Mr. Anthony R. Barker, Greenhill, Harrow) and "Urn" (Mr. A. J. Pitcher, Launcestone, Worcester Park).

THE OWEN JONES STUDENTSHIP AND 100/.

Two applications were received for the Owen Jones Studentship from the following:—Mr. Robert Atkinson, six strainers; Mr. Arthur R. H. Jackson, six strainers. The Council awarded the certificate and (subject to the specified conditions) the sum of 100/ to Mr. A. R. H. Jackson, Royal College of Art, South Kensington.

THE PUGIN STUDENTSHIP AND 40/.

Three applications were received for this studentship from the following:—Mr. F. Townson Clark, six strainers; Mr. A. J. Margetson, six strainers; and Mr. Wilfrid J. Travers, six strainers. The Council have awarded the medal and (subject to the specified conditions) the sum of 40/ to Mr. A. J. Margetson, Gordon Road, Handsworth, Birmingham.

THE TITE CERTIFICATE AND 30/.

Twenty-one designs for a loggia for sculpture to screen the blind end (150 feet long) of a building were submitted. The Council awarded the certificate and (subject to the specified conditions) a sum of 30/ (augmented by the sum of 20/ from the funds of the Wimperis Bursary, on the condition that the period of travel be extended from four to six weeks) to the author of the design bearing the motto "Vignolia" (Mr. G. Salway Nicol, Colmore Row, Birmingham); and a certificate of honourable mention and 10 guineas to Mr. Napier Hemy, Hampden House, Phoenix Street, London.

THE GODWIN MEDAL AND 65/.

The Council do not make an award this year.

THE ARTHUR CATES PRIZE, 40/.

Three applications were received from the following:—W. W. J. Calthrop, six strainers; Frank Dyer, six strainers;

W. Dathy Quirke, six strainers. The Council have awarded the prize to Mr. W. W. J. Calthrop, London.

THE GRISSSELL GOLD MEDAL AND 10 GUINEAS.

Four designs for a grand stand constructed of timber on a race course were submitted. The Council have awarded the medal and 10 guineas (with an additional 10 guineas from the funds of the Wimperis Bursary) to the author of the design bearing the motto "Royal Ascot" (Mr. W. A. Mellon, Westminster, London).

THE ASHPITEL PRIZE.

Mr. J. T. Halliday, Stockport.

The designs and drawings submitted for the Institute Prizes and Studentships are on exhibition in the Gallery of the Alpine Club.

THE LATE STANFORD WHITE.

IN the *Brickbuilder*, of Boston, U.S., are some recollections of the late Mr. Stanford White by a few of the architects trained in his office, from which we take the following:—

By Mr. J. Monroe Hewlett.

His tremendous enthusiasm in his work invariably communicated itself to all who were engaged with him upon any given problem, and the rapidity with which he reached a conviction as to what he was trying to do in any given case was equalled only by his tenacity in adhering to that conviction, and refusing to be satisfied until the result was brought absolutely into line with his mental picture. From this it resulted that he never ceased studying his work until its actual construction prevented further study; and though words of commendation from him to those working under him were few and far between, yet, when won, they were so spontaneous and sincere as to carry absolute conviction to the mind of the recipient and prove an incentive to redoubled effort.

No one who has ever worked with Stanford White in the development of an architectural or decorative scheme and the supervision of its execution can have failed to realise that in his mind the execution of the design exceeded in importance the production of the design itself. To work with and under him was to appreciate as never before the fact that the building, not the drawing, is and should be the architect's chief concern; and that no vigour of conception or beauty of composition in the finished work can compensate for the absence of that fragrance which results from the embodiment in it of knowledge and love of the refinements of form, colour and texture.

It is safe to say that his influence will not be a passing one, but even as that of the French school has been the most powerful factor in the orderly development of our architectural education, so that of Stanford White is and will continue to be pre-eminent in the creation and preservation of standards of good taste and refinement in our architecture and decoration.

By Mr. F. L. V. Hoppin.

Perhaps of the many who came into personal contact with him, none are better equipped to judge of his genius and ability than those who had the privilege of being for many years his students and his draughtsmen, for he was quite at his best when engaged in the heat of his work, and beset by the intricate problems of plan and design which, by his very progress of creation, he constantly encountered; but his versatility was marvellous, and had Stanford White seriously undertaken to be a painter or a sculptor, there cannot be a shadow of doubt that he would have been among the foremost artists of his day.

His great knowledge of drawing and perspective enabled him to give instant expression and form to his conceptions through the medium of his well-trained office force.

For many years he found a rich field for his ability in the erection of numberless country houses, and it is to him in a very large measure that a desire for more substantial and architecturally beautiful residences of this nature was created. His frequent visits in Europe, and especially in Italy, in the early years of his practice, gave him a sense of proportion and a versatility of expedient in designing that was remarkable, and he and his firm soon became the exponents of the Italian Renaissance in this country, and their devotion to Classic lines in all their work was consistent throughout and from which style they rarely departed.

His nature was an impatient one, yet generous to a fault, his manner often brusque and harsh; yet did he realise that he had given hurt to anyone he would go to infinite pains to relieve the distress he had caused.

He sometimes fell into the common error of over-

ornamentation in his exteriors, and frequently in his interiors, impelled by his innate sense of colour and combination of values, would daringly mix his epochs which, carried out by another hand, would have been ludicrous and bizarre in the extreme, but, which, almost invariably, were peculiarly charming and in some instances magnificent.

He was extremely optimistic by nature, and enthusiastic to a degree, which latter he invariably conveyed to all about him, whether clients, draughtsmen or builders, and in his unflagging spirits and enormous vitality would accomplish a vast amount of work. He had a wonderful memory and grasp of detail, and his knowledge of precedents and where to lay his hands upon them, whether in his library or elsewhere, was of the greatest service to him, and most remarkable. He was intensely keen in his work, his attitude towards his clients was very convincing, his enthusiasm for his conceptions was tremendous in its courage of conviction whether in small or large undertakings invariably.

He was a born leader and instinctive superintendent, for he always had the instant sympathy and co-operation of the builders and workmen, who cheerfully at all times catered and responded to his directions and impulses, whether they considered them vagaries or otherwise. He was possessed of a charming sense of humour, and was a most delightful companion.

His place in the world of art will always be most unique and individual, and his influence and that of his colleagues has been a most distinct factor in the development of American architecture and decoration.

By Mr. Albert Randolph Ross.

I shall never forget the first time I saw him, many years ago, at his old office in No. 52 Broadway, where I was sitting with my heart in my boots waiting to see Mr. Mead, with the hope of being taken into their office as a draughtsman. Swish! bang! went the outer double swing doors; swish! bang! went the inner swing doors, and in much less time than it takes to tell there shot across my vision a lithe, fierce-moustached giant with a big hat on a head of close-cropped blonde hair standing straight out in every direction. That was Stanford White, and was generally characteristic of the immense nervous vitality that enabled him to accomplish such an incredible amount of work that would have sent most men into nervous prostration. But there were times, however, when this mad haste abated. At the end of the short winter days when the office lamps were lighted and all but a few of the faithful draughtsmen had gone to their homes, and the worry of the day's routine was over, in the most affable frame of mind, softly whistling to himself, he found the time and inclination to carefully review his work and put the finishing touches to his conceptions. Those were indeed happy times. Then were he and his two associates in their best vein; then did McKim "go fishing," as he was pleased to call poring over old volumes of Roman masterpieces, and then did they admire or aid with criticism each other's work.

His designs were conceived spontaneously, and he was little bothered by precedent or the formal principles of architectural planning. In directing his draughtsmen he expressed his thought always with a pencil rather than by discussion. After covering, oftentimes, yards of tracing-paper with alternative suggestions for work under consideration, he would eliminate all but two or three of the most pleasing and turn the matter over to his draughtsmen to "do something," which he would either reject at sight or, if this "something" was found favourable, used it as the basis of future study.

Unlike the influence of his patron Richardson, in whose office I believe he received his architectural training, the study of his work or even an attempt to follow in his footsteps will make for the advancement of our architecture and her allies.

Men with such high and pure ideals in art are few indeed, and the many beautiful things he has conceived and left us will most fittingly commemorate this big, versatile, impatient and kindly man.

By Mr. Philip Sawyer.

While so many of us are tired and our work perfunctory at the end of ten years' practice, McKim, Mead & White show in their design the vitality and light-heartedness of perennial youth. And it seems to me that this was in part Mr. White's contribution. He was an engine for energy, promising recklessly impossible things, and causing everyone he came in contact with to accomplish them.

Never tired, never indifferent, you might find him hammering for the porter, hatless, his hands full of papers, at seven in the morning, and leave him striding up and down the deserted office at seven in the evening, while it was always likely that he would shoot in at any hour of the night, throw off his coat and, pouncing upon a lone draughtsman, begin working upon a new problem, on the assumption apparently that sleep is unnecessary and night non-existent. Office hours meant nothing to him, nor to anyone identified with the work in which he was interested.

To work for him was at first a fearful experience, later an inspiration; a terse statement of the requirements, a few hieroglyphics and we're off on an endurance run which, last it for days, or weeks, or months, never cooled.

To him, an artist, architecture meant colour first and form and texture next, and proportion afterward and plan last of all. To handle material fitly, to adjust it to a new use, to devise its characteristic detail, to combine it with others consummately, to employ all that is beautiful in the old with all that is practical in the new; these things were a constant pleasure to him and to all who know and enjoy his work. I wonder how many, even among architects, appreciate how much the appearance of our cities—varied with light bricks and terra-cottas—owes to his single initiative.

Quick to recognise ambition and capacity, he gave great latitude to a man of proved ability, generous credit for good work done, and he showed an habitual indifference to one's previous failures; a constant assumption that you were just the man for the job and capable of anything, which brought results from the unlikely material.

Full of originality, seething with ideas, he had that rare sense which prevented him from adopting anything new merely for its newness. It must also be better intrinsically than any possible adaptation of the old if it were to win.

An experimenter always, the result was oftenest in the direction of some old beauty revived, new to the use and time, but centuries old in inspiration and of seasoned good.

PROFESSOR VON HERKOMER ON "THE PAINTER."

IN his lecture at the Royal Academy last week Professor von Herkomer said to his audience that he intended to speak as if to a lay audience. His lecture and the three that would follow it would be in a popular vein and largely autobiographical, and if he said things that seemed platitudes to the artists and students before him he begged that they would just "sit loose" for the time being. When you looked at a picture that pleased you you sometimes wondered what the painter was like, but it was difficult to satisfy this curiosity. Painters' portraits were not shown in the shop windows. There was no money in them, so they did not figure beside those of the ballet girls and others, and perhaps it was as well, for the artist's appearance might not be in sympathy with the kind of work he produced. Turner was said to have refused to sit for his portrait because he thought that if people saw what he was like they would not buy his pictures. Painters were not like those inventors of hair washes and similar things—noble and manly in their beauty—whose portraits they saw in advertisements. However, they would have the painter out and look at him. There was nothing now in his outward appearance to distinguish the artist from the stockbroker. Sixty years ago a man might ask his hostess at a reception who was the untidy man with touzled hair, and he would be told he was an artist. Now he would ask, "Who is that handsome young man, so well groomed and turned out?" and be told it was Mr. So-and-So, the distinguished portrait painter. Commenting on the still existent peculiarities of costume of the French art student, the lecturer remarked that all these artistic eccentricities were more or less modern. If we looked back at portraits of painters of old times we saw that they were dressed exactly like other men. In the Bohemianism of the art student there was pride, of course, and why should not the artist be proud? He has a power of seeing the beauties of nature that most others have not—one of the greatest of God's gifts to men—and he can show to others in clear form visions they are unable to shape for themselves. The great painter proves a truth with every stroke and touches the heart. He is one of the moral forces of the world. His ideality need not be disturbed by the forces of life if he have character. And Professor von Herkomer, cited in this connection the

example of his father to whom he owes so much, who in spite of every difficulty and opposition never swerved from his ideal when he determined that he would make his son a painter.

The lecturer touched next, says the *Morning Post*, on the dangers to the painter of sudden success, the importance of which he was apt to overrate. It did not make life a path of roses. Was he to go on reproducing the same class of subject and thus sacrifice his artistic freedom, or should he enlarge his formula and lose his public? The successful man has struck a vein, but he must dig deep to see if it contained enough ore to last through his life. A small accident would sometimes turn the painter's life from affluence to want. He was motoring in the country and met an old artist who when young had enjoyed a good reputation and had built upon its endurance. A dealer offered to buy all he did, and asked him among other things to copy a picture for him. The artist did it, but refused to forge the signature, and for this the dealer ruined him. Yet this man's sketches would be a credit to any landscape painter. Some of them the Professor took home, and when people saw them in his studio and thought they were his they admired them. But when they heard they were the work of an unknown man most of them turned their back upon them. Such was the value of a name, a thing that influenced even painters who ought to know better. After a reference to the worship of Raphael, even of what were the "pot boilers" of that artist, and some comparison of Raphael with Millais, the Professor spoke of his own younger days.

The youth of to-day, he thought, had a different character from the youth of his time. In his own recent experience as a teacher he had not found the same earnestness and industry as of old, perhaps because the students were better off. The general standard of excellence had certainly risen largely since his student days, but the question as to whether the improvement would be maintained was in the balance. Art requires youthfulness. Not youth, for we do not have infant prodigies in painting. But from eighteen to thirty-five you get your best efforts, and although you may keep up your standard for years you cannot make your type of art after thirty-five. To-day nearly all subject painters produced portraits, and aroused jealousy because they made more money at it. But it should be remembered that the portrait painter has things to contend with that make his the most exacting of all the branches of the graphic arts. The portrait painter cannot go to his studio like a clerk to his desk, but he must be prepared at any moment to do his best work. Then the difficulties, the constant change of feature, the conflicting claims of his art and his client. The portrait painter has to live a more expensive life, he has to have a good studio, he must have about him a certain sumptuousness, and be able to ask his clients to dinner. He may have to go out into society when he wants most to rest. The lecturer compared this with the life of a landscape painter who goes out into the fields with only a sketch to think of. Perhaps he does a little fishing in the intervals and only paints his pictures at his own convenience when he returns to town. He has but one public to please—the portrait painter has in addition to please the sitter's friends. On the other hand the portrait painter has the inestimable value of the close relationship that is established between the artist and the sitter. With all its exactions, portrait painting was a great human art.

HOLYROOD CHAPEL.

A MEETING of the Edinburgh Architectural Association was held last week to consider the following notice of motion by Mr. James Bruce, W.S.:—"That, looking to the public interest that has been aroused on the question of the repair and restoration of the Chapel Royal, Holyrood, through the intimation of a legacy of 40,000*l.* for these purposes by the late Earl of Leven and Melville, it is desirable that the Association should, through a committee of its Fellows, obtain a report on the following points, viz.:—1. What remains of the structure exist. 2. The conditions and capabilities of the parts remaining. 3. Whether the evidence of these parts is sufficient to enable a satisfactory repair and restoration of the structure to be made. And that the committee consist of the following, viz.:—Mr. Hippolyte J. Blanc, R.S.A., president; and Messrs. J. T. Baillie, Henry F. Kerr, David Robertson, Harold O. Tarbolton and John Watson—Mr. Blanc to be convener." Mr. H. F. Kerr presided.

The Secretary said that Mr. Bruce was unable to be present, and that the motion would be moved by Mr. Daniel Macfie. A letter was read from Mr. John Watson intimating that he desired that his name should be removed from the proposed committee.

Mr. Macfie, in submitting the motion, said that in his view the motion spoke for itself and required no apology or elaboration. If it did it would ill become him, a mere layman, to enter a field where even experts might fear to tread. He might, however, recall the feeling of satisfaction and expectation with which the public read of the pious intention of the Earl of Leven and Melville with regard to the restoration of the ancient chapel of Holyrood. They would also remember the disappointment the public felt when they read the announcement of Professor Lethaby's report and the decision consequent on it. He thought it was very generally felt that that report considered rather too much only one view, and that there was some call in the public interest for an independent inquiry such as the motion contemplated. The public were entitled to assume that the donor had, in the most reverent spirit and under expert advice, carefully considered the whole matter. They who knew Mr. Ross knew that he was nothing if not conscientious, and that any opinion that he might have formed would be the result of careful and exhaustive study of a difficult and complicated question. It seemed to him that the Association was clearly entitled to say something on that very important public question. The motion was wise and cautious. It did not impute blame. It did not commit them to any course of action but that of inquiry and report. He was sure that the representative committee that had been suggested would properly carry out the inquiry, and that with their accomplished President as convener they might be sure that its deliberations would be safely and surely guided.

Mr. F. W. Deas said they had had very short time to consider the motion. The subject was very important. They should proceed very cautiously before they committed the Association to any course of action regarding it. In view of the absence of Mr. Bruce, Mr. Tarbolton and Mr. Hunter Crawford, and in view also of Mr. Watson's intimation, he urged that consideration of the matter be delayed.

Mr. R. S. Lorimer said that the terms of the Earl of Leven and Melville's will were very precise. Two trustees were appointed, and he understood that if Mr. Ross, for any reason, did not take up the work, or if either of the trustees refused to act, then the scheme fell to the ground. The question was, Could any good purpose be served by the motion in view of the terms of Lord Leven and Melville's will? He was in sympathy with the feeling of disappointment aroused by the decision of the trustees that the chapel could not be restored, but at the same time he thought the proposer of the motion had not known, or had forgotten, the terms of the will.

The Chairman said they had lawyers in their Association, and one of them was Mr. Bruce. He supposed Mr. Bruce knew quite well the terms of the will. But with all deference to Mr. Lorimer, he did not see what they had to do with the will. As an abstract question, Professor Lethaby's report brought out several points which, in his opinion, made Holyrood Chapel incapable of restoration. The supporters of the motion thought the chapel might be restored, and they proposed measures to find that out. He did not suppose that even if the committee reported favourably, it would have any influence in the matter. But the Association had nothing to do with that.

Mr. Deas moved that the matter be delayed. It seemed to him that the Association should guard itself against any action that would stultify itself and which might weaken its action on future occasions when its influence might be very great. He did not want the Association to go before the public saying they should do this or that unless they had solid ground to go upon. He did not wish the Association to do anything which was not business-like.

Mr. Macfie said it would be unfortunate if they went to a vote on the question. In view of the opinions that had been expressed, and in the absence of the President—which he thought was the only absence that ought to count—he was quite disposed to allow the matter to be delayed. In taking that action there was nothing to be lost but time. It was one of the conditions of the will that the King should be consulted. So far as they knew, that had not been done. But he did not think they had anything to do with the terms of the will.

The Chairman said Mr. Blanc had received a letter from Professor Cooper, Glasgow, which contained the following

passage:—"I am unable to be with you to hear the discussion on Mr. Bruce's motion at the Architectural Association. I earnestly hope it will be carried. It is too soon, of course, to anticipate the result of such an inquiry, but if its results be as I expect, I hope we shall hear no more of the 'artistic objection.' The Gothic masons certainly gave us beautiful stonework, but the glory of their architecture, though enhanced by that and the fine sculpture which they occasionally produced, was not in the detail but in the mass—the soaring pile, the pillars, the arches, the vaulted roof, the majesty of light and shade. Many of the details at York were destroyed by fire, but the magnificent sense of spaciousness was hardly impaired at all. These effects can be got back at Holyrood, and Scotland needs a chapel royal where our king 'and his nobles all' may be seen in Scotland worshipping on high occasion the King of kings. The use of Holyrood on these days would be enormous."

It was agreed to convene a special meeting on a date not fixed for the discussion of the subject.

Mr. Walter Gilbert, Bromsgrove Guild, Worcestershire, read a paper entitled "The Sculptor and the Garden." The paper was illustrated by limelight views.

HEREFORD CATHEDRAL.

IN connection with the completion of the new west front of Hereford Cathedral, work on which has been carried on since 1901, it is interesting to note that there now only remains to be finished the west front of the south aisle. This is estimated to cost 2,800*l.*, and an appeal for a sum of 3,000*l.* to meet the expenditure is being made. The total cost of the new front is set forth as 14,800*l.*, including the new window, statues, &c. The erection of the west window was commenced in 1901 as a memorial to the late Queen Victoria from upwards of 8,000 women of the county and diocese of Hereford, at a cost of 1,500*l.* It was unveiled by Princess Henry of Battenberg on May 13, 1902. Subsequently it was found necessary to carry on the further renewal of the west front, the pinnacles and upper part of which had been rendered insecure by the earthquake of 1896, while the whole façade, as rebuilt by Wyatt in 1786, was utterly unworthy of the rest of the cathedral. The upper portion was completed and paid for at a cost of 3,000*l.*, making a total of 4,500*l.*

After this the completion of the west end of the nave was undertaken. This involved the projection of the two heavy buttresses, between which there is a west portal with double doorways into the cathedral. This work has been done at an additional cost of 4,500*l.*, and was dedicated by the Archbishop of Canterbury in March 1904. The renewal of the west front of the north aisle, with addition of massive turret and carved medallion, at an expenditure of 2,800*l.*, was completed in December 1905.

GLASGOW UNIVERSITY BUILDINGS.

A CORRESPONDENT of the *Glasgow Herald*, who appears to be a painter, has called attention to the absence of mural paintings in the buildings. He says:—Beautiful in line and proportion, an essentially picturesque feature of our cityscape, our University buildings have the frame but not the picture. The long line of niches on the façade, which seen from across the park promise an interesting and instructive series of statues, proves on closer investigation to be empty. The spandrils of beautifully groined arches terminate for the most part in rough blocks of stone, left to be carved when Providence intervenes. Noble windows, where the light was meant to glorify the pictured pane, are mere holes in the wall blocked with white glass, leaded in a lattice suggestive of a prison. Great sweeping expanses of wall where art should proclaim in voices of fresco and mosaic the history of the Corporation, are meantime disguised in a decoration of distemper conceived in the taste which distinguishes the cheap tenement house. The staircase from the Bute Hall, which could be and should be a crowning beauty of the structure, is an empty well, disfigured by staring iron beams which would be disdained by an office building down town. In the Randolph Hall a commencement has been made, and the Burne-Jones windows there strike the keynote of the harmony which should fill the entire building.

The University wants decoration. Its walls, its windows, its empty niches, its rough, uncarved blocks call out for it. The University is worthy of decoration. Its buildings are

noble in their proportions, beautiful in their design, interesting in their spaces. The University must have decoration if the training of its students is to be complete. Aberdeen has shown the way. It is not many months since the eyes of Scotland were fixed on the University of the North. We cannot yet have forgotten the grand east window of the Mitchell Hall, picturing the history of the University from its foundation; the gallery of paintings leading to that hall; the great staircase facing the principal entrance, with its quaint stone and carved mottoes; nor the decorative heraldic scheme on the façade of the College gateway illustrative of our kings and of the history of the Marischal College. What Aberdeen has done, Glasgow could do on a much greater scale.

We have the men. The decorative artists of Glasgow at present stand as high in general estimation as any in Europe. We have the money. Glasgow is the largest and richest city in Scotland. All that is wanted is a feeling of the need for this work, and a proper organisation to direct it. I understand that the general supervision of the University buildings is at present in the hands of the master of works.

On a recent visit there the writer found that an extra door leading to one of the examination halls had been pierced, the original door, of good and appropriate design, not being found sufficient for the impatience of the students. This door had been cut in a wall where, from the design of the wall as conceived by the architect, a flat wall space was wanted, and it had been constructed of plain flat iron, exactly like the door of an office strong-room. No reason could be assigned why this type of door had been chosen, and one was tempted to the conclusion that pains had been taken to supply the ugliest and least suitable possible. Inquiry of a passing official elicited the information that the door had been put there during the vacation, on an order from the master of works, and no other authority was deemed necessary. This is not as it should be.

A committee of the Senate, or some member of it known as an authority on architecture, should be appointed to authorise and supervise all architectural or decorative work on the buildings. That the buildings as they stand were meant to be completed by a scheme of decoration is patent to the least observant. A scheme should be drawn up, and it should be seen to that all work proposed to be done should fit into it. It is not for an individual and an outsider to propose a complete scheme for the decoration of our University, but I may be allowed to indicate the lines along which it must inevitably run.

Statues are a clamant need. These should represent the founders, benefactors and former students whose fame has glorified their Alma mater. The niches are there for them, and the quadrangles have appropriate sites. A small head of the papal grantor of the original charter is to be found in the Senate-room, singularly enough inserted into the fireplace and preserved from smoke by a glass shade like those which cover funeral wreaths. This, with a couple of memorial tablets and busts, placed where they spoil the staircase, is I think all the sculpture the University at present possesses. Decorative carving is wanted in the corridors, entablatures and finials. A little beautiful foliage carving has already been done, but in most places rough blocks of stone are crying aloud for the chisel. Heraldic shields are wanted of the great families which have figured in the history of the University. The spaces for such arms are left above doorways, and evidently entered into the architect's idea. Fresco paintings are wanted on the large flat spaces in the grand stairway and elsewhere. Stained glass is wanted throughout. In this respect the Randolph Hall requires completion. History proper could well be left to the painter and the sculptor. The large windows should be emblematic of the purpose and teaching of the University, while all the small windows could be memorials to those professors and students who had left their mark on the inner life of the college without rising to the outside fame which would give them their rightful places in the niches of the façade. The wall of the Randolph Hall above the doorway wants a great mosaic of our Saviour, source of all arts and sciences, to render the scheme in that hall complete and comprehensible.

These are mere suggestions to be revised and completed by more competent authority. In a commercial city like Glasgow the question will inevitably be asked—Where is the money to come from for all this? The sum required would, of course, be large in the aggregate, but the subscribers should be many. One of the first statues on the façade should represent that ancestor of the Duke of Hamil-

ton who first gifted a piece of land for the building of the University, which till then was a mere homeless association of teachers and students drawn together under the protection of the cathedral. The present duke might present that statue for the honouring of his house, and his example would doubtless be followed by others whose forebears have shed glory on the family name by their benefactions. The historical and symbolical works might be presented by such of our merchant princes as are the architects of their own fortunes, who could thus leave a lasting memorial of themselves and place their own descendants in the position of the donors of the statues. The smaller carvings and windows could be provided by graduates and undergraduates who wished to commemorate a teacher or friend, and as the cost of these would be small there should be no difficulty in raising the necessary amounts from time to time. The two important points are—To raise public interest in this matter and to have such a scheme organised that all small portions carried out at any time should take a due and orderly place in the entire decoration when finally completed.

I trust that abler pens than mine will take up this question.

MANCHESTER INFIRMARY SITE.

THE special committee of the Manchester Corporation which has under consideration the utilisation of the Royal Infirmary site in Piccadilly, met at the town hall under the chairmanship of Alderman Sir James Hoy. It was decided to present again to the City Council for acceptance the report framed by the committee in August of last year.

It may be recalled, says the *Manchester Guardian*, that when the City Council met on September 5, 1906, and discussed this report they decided to refer it back to the special committee in order that the members of the Council might have time to consider in all their bearings the important recommendations which the committee had made. Sir James Hoy, on behalf of the committee, agreed to the suggestion, and stated that the more the committee's scheme was investigated the more likely was it to advance in public favour. The Infirmary site committee have now, after their further consideration, decided to recommend afresh the acceptance by the Council of their original proposals.

The special committee's report, which contains these proposals, mentions the obligation of the public free libraries committee of the Corporation to give up possession of the free reference library site in King Street (which has been sold for 161,465*l.*) at a date not later than March 1913.

As to the old Infirmary site, for which the Corporation has agreed to pay 400,000*l.*, the earliest time at which the Corporation are likely to be given vacant possession of the site is about two years hence, viz. at the end of 1908.

Nothing, the committee says, has occurred in either the art gallery committee or the public free libraries committee to indicate any change in the firmly expressed opinion of such committees as to the utilisation of the Infirmary site for their purposes. There is now an opportunity afforded of utilising this noble site in Piccadilly by the erection thereon of a building in which the present and prospective needs of the public free libraries committee and the art gallery committee can be adequately met, whilst allowing an addition of open space as compared with that at present existing. The Council will now have to decide whether the special committee shall carry on the work with which they have been charged beyond the present stage.

In concluding their report the special committee say:—"In consequence of the sale of the King Street library it is imperative that the Council shall provide a site for and shall erect a new reference library. A careful perusal and consideration of the valuable report presented by the art gallery committee to the Council in January 1906 (published shortly afterwards) will, it is believed, satisfy the public that the accommodation at the art gallery is wholly inadequate for the needs of that important institution. The question of associating a museum with the art gallery is one which is referred to in that report, and may well receive attention in connection with any scheme of provision for the work of the two committees concerned.

"In view of these important considerations the special committee now recommend the Council to authorise in more definite form than has yet been done the allocation to the public free libraries committee and the art gallery committee of the Infirmary site, subject to the completion of the necessary street improvements and to sanction the preparation

under the direction of the special committee, of plans to be hereafter submitted to the Council."

The report will come before the City Council at its meeting on the first Wednesday in February.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

AT the monthly meeting of the Scottish Society the first paper read was by Mr. James Barbour, architect, Dumfries, giving an account of the excavation, from June to October 1905, of an ancient stone fort near Kirkcandrews, by the proprietor, Mr. James Brown, of Knockbrea. The fort, or castle, is situated on a promontory in a little bay half a mile to the west of Kirkcandrews, and is mentioned in the New Statistical Account as then bearing the name of Castle Hayne. In plan it is oval on the east and straight on the west, and consists of a central area, 60 by 35 feet, begirt by a great dry built wall about 15 feet thick, having a gallery on the east side in the middle of its thickness, 80 feet long and $3\frac{1}{2}$ feet wide, and on the west side a gallery or long chamber, 54 feet in length and $3\frac{1}{2}$ feet in width, and at a little distance a smaller chamber 14 feet long and 4 feet wide. The relics found in the fort consisted of a quern-stone and some stone pounders and whetstones, a spindle-wheel and a rough stone disc with perforation in the centre, a bead of blue vitreous paste ornamented with white wavy lines, a ring-bead of amber, two spiral finger-rings of bronze wire, a bronze penannular brooch and fragments of chain mail. The bones found were those of domestic animals, chiefly ox and swine. Remains of red deer were met with, and fowls and fish were also indicated. Judging from the relics found and from the character of the building, the date of the fort is probably pre-Medieval.

The second paper, by Mr. Alan Reid, F.S.A.Scot., dealt with the churchyard monuments of Lasswade and Pentland, photographs of which, by Mr. James Moffat, were shown on the screen. Only fragments of the walls of the pre-Reformation church of Lasswade remain, its lofty gabled tower having been blown down in a wintry storm in 1866. The most important of the monuments remaining is the effigy of a knight in armour within the railed enclosure belonging to a branch of the Preston family; an incised slab bearing the arms of Somerville, and an inscription round the margin commemorating Elizabeth Bannatine, probably the spouse of one of the Somervilles of Drum. Perhaps the most interesting memorial now visible at Pentland is a massive slab with a floriated cross, unfortunately mutilated. Of the other more recent monuments, one is extremely interesting and uncommon. It has been a tablestone, on the ends of whose supports are four finely cut figures—a sower, a reaper, an eater and a flower-gatherer, the last with roses entwined about his body; while on the fifth and central support is a group showing Death as the King of Terrors, crowned and armed with a long spear, preparing to attack a trio of victims—a youth, a seated female figure, and a baby on her knee, the youth vigorously interposing between Death and his prey.

ST. NICHOLAS CHURCH, BARI.

AT a meeting of the Glasgow Branch of the Scottish Ecclesiological Society a paper on "St. Nicholas of Bari" was read by Mr. J. D. G. Dalrymple, F.S.A., vice-president. He said that almost no part of Italy is so little known to British travellers as Apulia. Bari is a town of great antiquity, and has had a chequered history. Originally a Greek colony, it fell under the sway of Rome, and when the Western Empire came to an end passed into the possession of the Byzantine emperors. For a time it became subject to the Lombard Dukes of Benevento, was then seized by the Saracens, from whom it was recaptured by the Greeks, and they in 1071 were compelled to surrender it to the Normans under Robert Guiscard. The relics of St. Nicholas, Bishop of Myra, the patron saint of sailors and travellers and the friend and protector of children, were brought to Bari in 1084, and the construction of the great church which now contains them was commenced in 1087. It is a plain and rather gloomy edifice of the basilican type. The eastern portion, containing the choir, has gable walls at each side, and forms a species of eastern transept. The apsidal choir contains a fine screen and a very interesting ciborium or baldachino of great antiquity. The most interesting part of the church is the crypt, where the relics of the saint are deposited. From them is supposed to distil

a liquid which, under the name of "the manna of St. Nicholas," is sold and distributed to crowds of pilgrims who come to pay their devotions at the shrine. It is believed to have healing properties of the most valuable description, and is either taken internally or used as a lotion with the most beneficial effects. A sample brought to Scotland was subjected to a chemical analysis, with the result that it was found to be pure water from a deep spring originating in chalk, marble or other limestone strata. A similar liquor, with powers equally miraculous, is supposed to distil from the bones of St. Andrew, in the crypt of the cathedral of Amalfi. In Sir Walter Scott's "Kenilworth," curiously enough, the name "manna of St. Nicholas" is applied to the poison prepared by Alasco and administered to the Earl of Sussex, and also used by Varney in his attempt to prevent Amy Robsart's presence at the revels in honour of Elizabeth.

On the motion of Professor Cooper, seconded by Dr. Honeyman, a vote of thanks was awarded to Mr. Dalrymple for his paper.

LONDON COUNTY HALL.

THE establishment committee in their last report on the proposed competition state:—We have given further consideration to the question of the time to be allowed for the competition for designs for the new county hall, and have considered a letter from the Royal Institute of British Architects, who suggest that nine months should be allowed, six of which should be devoted to the preliminary part of the competition. The time which it was originally proposed should be allowed was eight months, four months to be devoted to each part; but we think the Council will be well advised to allow the additional month suggested, and we have accordingly requested our chairman to ask leave of the Council to make the necessary alterations in the conditions when the same are under consideration by the Council.

We propose that, in accordance with the practice which we understand usually obtains, a fee should be charged for copies of the conditions and particulars, &c., issued to intending competitors in connection with the competition for designs for the new county hall, and we think that a fee of 3*l.* 3*s.* in this instance will be suitable. This fee will be returned on receipt of a bona-fide design or if on receipt of the conditions any architect decides not to compete and returns the conditions, &c., within two weeks. We recommend:—

That a charge of 3*l.* 3*s.* be made for each copy of the conditions, &c., supplied to architects desiring to compete in the preliminary stage of the competition, the fee to be refunded on the receipt of a bona-fide design or if on receipt of the conditions any architect decides not to compete and returns the conditions, &c., within two weeks.

SCOTTISH MODERN ARTS ASSOCIATION.

A CIRCULAR has been addressed to those interested in Scottish art in which the objects of the new Association are indicated generally. The objects of the Association are to insure the preservation of representative examples of Scottish art, more particularly by acquiring works of contemporary Scottish artists, and also to assist in the enriching of Scottish public art collections. These objects are to be attained by (1) the acquisition of works of art by Scottish painters, sculptors, etchers and other craftsmen; (2) the acquisition of works of art by artists other than Scottish; (3) arranging for these works being suitably exhibited; (4) the endeavour to secure adequate representation of Scottish art in British national collections; (5) the furtherance of any scheme which has for its object the promotion of Scottish art. A general meeting of the Association will be held in Edinburgh early next month, when the constitution will be passed and the office-bearers and committees elected. In the meantime, membership of the Association is to be constituted by the payment of a minimum subscription of one guinea per annum. In reference to the eventual housing of the property of the Association, the following extract from the Association's circular is of interest:—"Although nothing definite can be decided upon at present, it may be mentioned that, while taking into strict account the claims of the various provincial art collections of Scotland, the ideal to be kept before the Association will be the formation of a Scottish National Gallery of Modern Art, the possession, not of a city or a corporation, but of a people."

Chartered Surveyors' Golfing Society.

SIR,—In case it may be of interest to your readers, I have been asked to inform you of the formation of the "Chartered Surveyors' Golfing Society," membership of which is restricted to members of the Surveyors' Institution, with a view to arranging matches with societies of the kindred professions, in addition to which it is proposed to hold an annual tournament.—Yours faithfully,

S. JAMES CHESTERTON,

Hon. Sec. Chartered Surveyors' Golfing Society.
116 Kensington High Street, London, W.

GENERAL.

The American Institute of Architects have elected the following Council:—Frank Miles Day, president; William B. Mundie, first vice-president; R. Cipton Sturgis, second vice-president; Glenn Brown, secretary and treasurer; Walter Cook, Edgar V. Seeler and J. L. Mauren, directors for three years; and Robert Stead, auditor.

Sir David Wilkie's House, No. 144 Kensington High Street, has been indicated by one of the County Council's tablets.

Dr. Henry Woodward, F.G.S., will read a paper on Monday evening at the Surveyors' Institution on "The Uses of a Geological Collection," which will particularly refer to the specimens in the Institution.

A Course of Lectures and demonstrations for sanitary officers will be commenced at the Parkes Museum on February 11. In connection will be a series of competitions and demonstrations.

Mr. A. W. S. Cross, M.A., and Mr. G. Hubbard, F.S.A., will read a paper and open a discussion on "The Revision of the Charter of the Royal Institute of British Architects" at the Northern Architectural Association on Wednesday next.

An Exhibition of the works of Mr. Holman Hunt will be held in the Walker Art Gallery, Liverpool, from February 2 to March 2. It is expected a larger number of pictures by the artist will be seen on the walls than in any exhibition of his works hitherto held.

Mr. Robert Bowring, of Wells, Somerset, announces that he will offer for sale by auction, in a marquee in the grounds on June 6, the mansion known as the Abbey House, Glastonbury, in a portion of the grounds of which stand the ruins of Glastonbury Abbey, which are included in the estate offered for sale.

The Competition instituted by the Local Government Board for Ireland for three prizes for designs of labourers' cottages most suitable for rural districts has resulted as follows:—First prize (50*l.*), Sydney Moss, Rockbank, Eccles, Lancashire; second prize (30*l.*), J. Roseman Burns, 17 Serpentine Avenue, Ballsbridge, Dublin; third prize (20*l.*), T. M. Deane, 15 Ely Place, Dublin.

The Glasgow Town Council have remitted to the city engineer and the city librarian to consider and report as to the erection of a tablet or other memorial at the various district libraries recording the fact that the buildings were the gift of Dr. Carnegie.

The Bucks County Education Committee have considered the numerous applications for the appointment of an architect for the new elementary school for 600 children at Slough. It is understood that Mr. Arthur C. Lee, architect, of 134 Oxford Road, Reading, and also of High Street, Slough, has received that appointment.

The Glasgow University Court considered last week a letter from Mr. J. D. G. Dalrymple, in which he said the Glasgow Archaeological Society had recently celebrated its jubilee, and as he had the honour to hold the office of President, it had occurred to him that it would be a fitting way to commemorate the event if he were to establish an archaeological lectureship somewhat on the lines of the Rhind Lectureship in Edinburgh, though on a much smaller scale. The course would consist of five or six lectures as might be arranged by the Council of the Society, with whom would lie the appointment of the lecturer. The honorarium for the course would be the sum of 50*l.*, which he would provide. He was anxious that the lectures should be delivered in the University, and that the project be recognised by the University Court; but in view of the possibility of its not being so, he proposed at first only to establish it for five years. The letter was remitted to a committee for consideration.

The First Commissioner of Works has communicated to Mr. Charles A. Jones (deputy-constable of Carnarvon Castle) the fact that the charge and maintenance of the castle had been transferred to the Board of Works on the 1st inst., but without affecting the personal rights or privileges of the constable (Sir John Puleston) or the deputy-constable.

At the Monthly Meeting of the Bexhill education committee it was stated that the cost of the new school on the Down had been 6,718*l.* 12*s.* 8*d.*, architect's fees amounting to 335*l.* 18*s.* 8*d.* The committee discussed various financial adjustments between them and the architect, and a debate ensued upon a motion that a claim of the architect for 2½ per cent. providing for future extensions be not at present paid. One councillor thought an architect would be entitled to payment of 2½ per cent. for the preparation of plans and specifications for an extension which was projected. The motion was agreed to.

The Camberwell Borough Council discussed at their last meeting the future of the South London Art Gallery. The libraries committee recommended the London County Council be offered the control of the gallery, subject to certain conditions. On a vote being taken thirty-three were in favour of the retention of the gallery in the hands of the borough council and twenty-five against, the recommendation being accordingly rejected.

The Royal Female School of Art, Queen Square, Bloomsbury, was summoned recently at Bow Street police court before Mr. Marsham for the nonpayment of local rates amounting to 48*l.* 19*s.* 2*d.* For the defendants it was said the school was established many years ago, and in due course obtained a certificate under the provisions of the Scientific Societies' Act, showing that the school ought to be exempted from the payment of rates as a society carried on exclusively for the promotion of science and fine arts. He asked for an adjournment to enable him to appeal to Quarter Sessions. The town clerk of Holborn said the rating committee of the Council had reviewed all the circumstances, and they were of opinion that the defendants should not be exempted from paying rates. The summons was adjourned for a fortnight, the defendants' solicitor intimating that they would certainly appeal, as under the circumstances they felt they ought not to be called upon to pay rates.

Mr. J. Pentir Williams, coroner for North Carnarvonshire, has written respecting the discovery of over 500 Roman bronze coins found recently during some excavation work on the slope of the Little Ormes Head, Llandudno. Mr. Williams stated that he did not think it was necessary to hold an inquest respecting the find, and his opinion was confirmed by the solicitor to the Treasury. He therefore advised that the coins should be returned to the finders, but that their attention should be called to a communication received by the Treasury solicitor from the British Museum. It was to the effect that the keeper of the coins and medals at the Museum would be pleased to classify the coins and return them if they were submitted to him. It was of no use to examine the hoard unless all the coins were seen. Any deductions otherwise would not be sound. Treasure trove is defined as "gold or silver coins, bullion or plate, concealed in a house or in the earth by an unknown person." Bronze coins do not therefore come within the definition.

Mr. Alfred Creer, York city surveyor and engineer, has placed his resignation in the hands of the street and buildings committee. Mr. Creer, who took up the appointment in October 1889, served his articles under the Improvement Commissioners at Birkenhead. Subsequently he served five years with them as assistant, and was then appointed district surveyor at Halifax, afterwards becoming deputy to the borough engineer. Thence he went to Lancaster as city and water engineer.

Sir J. T. L. Rolleston, of London, the umpire in the matter, has awarded the owners of the projecting block of buildings at the corner of Long Millgate and Fennel Street the sum of 25,957*l.* as compensation from the Manchester Corporation. The owners claimed 35,000*l.* Their witnesses at the recent arbitration valued the premises as under:—Mr. T. T. Wainwright, 31,671*l.*; Mr. Charles H. Heathcote, 31,475*l.*; Mr. W. H. Robinson, 32,722*l.*; and Mr. Emanuel R. Levy, 31,475*l.* For the Corporation the valuations were:—Mr. J. W. Beaumont, 17,599*l.*; Mr. F. H. Oldham, 18,322*l.*; Mr. Joseph Swarbrick, 17,786*l.*; and Mr. G. H. Larmuth, 17,732*l.* The arbitrators for the claimant and the Corporation respectively were Mr. T. Silk Wilson, F.S.I. and Mr. J. D. Wallis, F.S.I., both of Manchester.

The Architect.

THE WEEK.

AN important judgment respecting gables when measuring the height of buildings under the London Building Act was given last week by Mr. Justice KEKEWICH. In the definition of the Act "the expression 'height' in relation to any building means the measurement taken from the level of the footway, if any, immediately in front of the centre of the face of the building, or, where there is no such footway, from the level of the ground before excavation to the level of the top of the parapet, or where there is no parapet to the level of the top of the external wall, or, in the case of gabled buildings, to the base of the gable." A block of flats was erected partly in Salem Road, which is 40 feet wide, and partly in Moscow Road, which is 52 feet wide. The buildings were 40 feet high to the gable; but the gable had two storeys and was 20 feet higher. It was contended that the gable was not a gable within the meaning of the Act, and therefore the whole height of the building, which was 62 feet, should be taken into account. In the course of the arguments it was admitted that the gable was a gable within the meaning of the Act. The question, then, was whether the building exceeded by its height the distance to the opposite side of the street. Evidence was given by MESSRS. GRÜNING, WHITE, CHATFEILD CLARKE, MEESON, DOUGLASS MATHEWS and DICKSEE. His Lordship said that part of the building was recessed, and that if the space were added to the width of the street the total width would be 63 feet. His Lordship held that the Act said nothing against starting a building with a low height in front and then working backwards by steps, increasing in height. Architects were entitled to adopt that arrangement when they could do so without offending against the Act. Mr. Justice KEKEWICH declined to consider certain questions of laches or delay, and his judgment accordingly was given for the defendants. The case has been exceedingly complicated, and the building had been commenced without any approval of the plans by the London County Council. But it suggests a more liberal interpretation of the Act, especially in cases of old streets which originally were narrow and subsequently widened.

THE late Empress ELIZABETH of Austria had displayed her love of art and of antiquity in the erection of a villa in Corfu, which was called the Achilleion. In the grounds were a great many statues, some of them being copies of ancient examples. About three years ago a company was formed for converting the villa into an hotel and bathing establishment. The project was not successful. Then it was suggested to make the place a rival of Monaco as a gambling resort. That scheme was also a failure. Now it is proposed to convert the Achilleion into a sanatorium for patients suffering from diseases of the lungs. It remains to be seen whether the scheme will be accomplished; but there is no doubt it would be the worthiest use to which the fallen palace could be turned under existing circumstances. The place is deserted, for the Austrian Government and the Empress's relatives decline to expend any money on its conservation.

THE committee of the Edinburgh Public Library are about to make an experiment likely to have a satisfactory result in promoting technical education. They intend to arrange special sections which will correspond with the various trades practised in Edinburgh. Catalogues will be printed of the books containing information on the different subjects. Copies are to be sent to employers, who will be asked to distribute them among their workmen, and to point out any deficiencies

in the collections which may be apparent. Another innovation will be the adoption in one of the libraries of a children's room, which has proved successful in English public libraries. Should it serve its purpose similar rooms will be made to form part of all the branch libraries. It is also arranged to have a music library, for, although the Scotch are supposed to be lovers of music, they have not as yet any public institution where pieces are to be obtained.

ARCHITECTURAL drawings, and all other works under glass, intended for this year's exhibition of the Royal Academy are to be sent on March 28. The days for reception of oil-paintings will be March 30 and April 2, and for sculpture April 3. The hours for reception are from 7 A.M. to 10 P.M. It is notified that "no artist is allowed to send or exhibit more than three different works." They are to be delivered at the Burlington Gardens entrance. The regulations correspond with those of last year. All works sent from the country or from abroad must be consigned to an agent in London for delivery at the Academy, unpacked, on one of the appointed days. No works in cases will be received, nor will the expenses of carriage be defrayed by the Academy. All the works sent by each artist must be entered on a printed form duly filled in with the name (Christian and surname in full, signed by the artist), and address of the artist, the titles and descriptions of the works as they are to be inserted in the catalogue, and the price if it is desired to place them on sale. These forms must be sent under cover addressed to "The Secretary." No advertisement, unnecessary quotation or narrative can be admitted. At the back of each frame must be written the name and address of the artist, with the title or description of the picture, and the number (if there be more than one) to which it refers in his or her list. This information must also be repeated with great distinctness and accuracy on a label attached by a string to the top of each frame, and made to hang over in front, as also to each piece of sculpture. The forms and labels can be procured (during the month of March only) from the Academy. Applications for them made by letter must be accompanied by a stamped and addressed envelope for their enclosure.

PHOTOGRAPHY has one advantage—in enabling painters and engineers to represent buildings with accuracy, although they may not be visited. One instance of the old method is mentioned in the new part of the "Journal of the Royal Society of Antiquaries of Ireland." At the beginning of the nineteenth century there was a pulpit orator—Dean KIRWAN—who was irresistible in drawing large contributions from congregations in Dublin by his sermons. The Governors of the Female Orphan House considered they were so indebted to him, they paid 204*l.* 15*s.* for a painting of the Dean, from which a mezzotint was prepared. The artist selected was HUGH DOUGLAS HAMILTON, who practised in London and Rome, as well as in Dublin. The likeness of the preacher is believed to be accurate, but it is now impossible to ascertain in what church he was exercising his persuasive powers. According to the "Journal":—"The inside of the church is represented as having a circular colonnade, behind which the congregation sit in tiers. In the centre of the open space is a circular pulpit, on the steps of which are eight children. The 'Round Church' of St. Andrew naturally suggests itself, but its interior was quite unlike the picture, and the annual sermon for the orphans was never preached there. As a matter of fact, such a church as that depicted existed only in the mind of the painter, who had an objection to entering a church, and so had to rely on his imagination for an interior. The children on the pulpit steps are said to be portraits of the LA TOUCHE family." If photography existed in those days, HAMILTON could be accurate in his architecture without any loss of effect.

AMERICAN PRACTICE.

THE Frenchman's maxim which declares that we can always find something which is pleasing to us in all the distresses of our friends is not universally true. Once we realise that a similar fate awaits us we become sincerely sympathetic and realise what it is to have a fellow feeling. In that way the relations between architects and their clients and public authorities in America cannot fail to have interest for Englishmen. The treatment of architects in Germany, Italy or France, has little concern for English clients and probably less for American. But if one of the Government departments of the United States came to the conclusion that work could be carried out in better style if the contractor were made responsible for the plan as well as for its execution, we might expect to discover that a similar revolution was impending in England. On the other hand, the adhesion to one set of rules for practice in England has been advantageous to American architects. For if there were no English precedents for architectural practice the people would be disposed to leave everything to wealthy and influential contractors.

In the last Quarterly Bulletin of the American Institute of Architects we have some indications that all is not sound in American practice. The position acquired by contractors is suggested when we learn that the board of directors discussed "the subject of abuses as they exist among contractors and sub-contractors, who employ architects and exact commissions to the detriment of the architectural profession." It was resolved "that a special committee of five be appointed to consider the relations of architects to the system of general contracting and await further action until their report is received." The meaning of the grievance is not manifest. But we suppose it is found to be not uncommon for great contracting firms who may be able to lend money to speculators in buildings to insist on having plans prepared in any way they deem to be most conducive to their interests. In modern structures the steel skeleton is considered the most important part, and therefore the engineer rather than the architect is recognised as the principal official.

The municipal authorities are also disposed to dispense with the services of architects, even when they are offered for the general good without expectation of reward. In Rhode Island, for instance, it was intended to revise the building regulations. For that purpose a committee was formed consisting of four architects, four insurance officials, three builders and three members of the City Council. It appears the latter have taken an unexpected view of what the insurance and architectural interests had in mind when the City was asked to co-operate, and have held themselves aloof, informing the other members of the joint committee that they will consider any report which may be submitted to them containing provisions for a revised ordinance. As a result there are doubts about the possibility of obtaining a rational building code which would be adapted to modern methods of construction. It was probably a disregard of tact which made the City Council appear to be always in a minority if compared with either the architects or the insurance representatives. The architects likewise failed in the effort to secure the adoption by the City Council of a proposed ordinance requiring the Mayor to approve, under the advice of an architectural expert, all plans for City buildings and all contracts for their construction, and to secure a more equitable and satisfactory selection of architects to design them.

The question of competitions is one about which American architects do not agree. The Illinois Chapter resolved at the annual meeting:—(1) That competitions are undesirable and unnecessary; (2) that in the interests of both clients and architects, whenever possible an architect shall be employed without resort to a competition; (3) that all rules for the conduct of competitions heretofore recommended or adopted by the

American Institute of Architects or its chapters should be repealed; (4) that no rules attempting to regulate the same should be adopted hereafter; (5) but that the Institute should exert its influence for the discouragement of competitions under all circumstances. It was recommended that the American Institute of Architects should discourage competitions (1) by refusing to give them official recognition except in special cases, and (2) by the refusal of its members to take any part in them, except those for public buildings, for the regulation of which its board of directors has been consulted. The argument of the Chapter was, that if members stood aloof competitions would become so disreputable that even the projectors would be compelled to abandon them. The desire to keep down competitors is explained by the circumstance that Illinois has a licensing law for architects.

The Iowa Chapter, on the other hand, are opposed to restrictions on competitions which would be found impracticable in their State. There is so little appreciation of architectural practice and design among people that the attainment of anything better seems to be an impossibility. While in favour of a professional adviser, it is believed that the proposal of the Institute to have "judges" must fail, because so few bodies instigating competitions are willing to delegate their authority to a board composed of a majority of architects who would, of necessity, be considered by them outsiders and more or less interested from the competitors' standpoint.

In the Rhode Island Chapter there was reference to discussions about architects "signing" their buildings. It is supposed to be self-seeking, although sculptors can put their name on their statues and painters on their pictures. The newspapers do not hesitate to extol not alone artists and sculptors, but men of handicraft—engineers and builders—and print *in extenso* the names of a building committee of a fire-engine station, a school house or a town hall, but they cannot, said a speaker, find a place for the name of the architect; he is too insignificant and has not played a sufficiently important part in the making of the structure to have his name appear. The statement is suggestive of the position of architects. American newspapers are only too glad to introduce names, and if they pass over those of architects it must be to please the public in general, who are supposed to be indifferent to designers. It would be well for the Chapters to consider whether there are any grounds for the departure from the ordinary practice of journalists. It should be mentioned that the omissions are not confined to America. In Europe exclusion of architects' names is common. It is not to be supposed that posterity will take the trouble to make researches in order to discover who was the architect of a particular building, and on that account the engraving of the names on buildings would be justified if there were no other reasons.

An effort has been made to have the Institute schedule of charges generally adopted, in which the minimum commission is 5 per cent. upon the cost of the work when over 10,000 dollars. It is laid down that every architect should charge higher rates whenever the demand for his services will justify the increase, rather than accept work to which he cannot give proper personal attention. No member is to compete in amount of commission, or offer to work for less than another. The Washington Chapter announced a scale of minimum charges. For buildings costing less than 10,000 dollars; the percentage was to be from 5 to 10. For two or more buildings erected from the same plans, full charges are to be paid for the first and one-half for the others, provided they are contiguous and erected at the same time. On buildings where the architect takes the place of the contractor an additional charge of from 5 to 10 per cent. is to be made. Drawings, specifications, &c., being instruments of service, are to remain the property of the architect.

From the foregoing remarks it will be evident that

the position of architects in America corresponds in a large measure with that of architects in England. A man who contemplates building can in England have his work done by people who technically are contractors, but who would not be recognised as trained builders. Municipal authorities are also disposed to be sceptical about the disinterestedness of architects in connection with schemes of public improvement. Time is, however, a great teacher, and sooner or later an improvement may arise in both countries, to the advantage alike of the public and of architects.

AN ACADEMY RECORD.*

THE completion of the Dictionary of Exhibitors at the Royal Academy is an event on which Mr. ALGERNON GRAVES deserves to be congratulated. The work is one which has interest not only for artists but for amateurs and those who buy or sell paintings, as well as for all who care about the history of English art. It is dedicated by special permission to the KING, and is worthy of such patronage.

In the eighth volume the dominant painters are TURNER and WATTS. The productiveness of TURNER is suggested when it is found that the list of his works requires seventeen columns and a half. Beginning in 1790, when he was a lad of fifteen, and continuing until 1850, the year before his death, his paintings exemplify not only manners but moods. It is remarkable that he started with representations of buildings, and it must not be supposed that he was at any time indifferent to them. The first work by him which was seen in the Academy was a "View of the Archbishop's Palace, Lambeth." In 1791 and 1792 he restricted himself to the same class of work. His address was then 26 Maiden Lane, but in 1793 he had a studio in Hand Court, Maiden Lane, from whence his works came until 1800, when he was elected an Associate and removed to 64 Harley Street. In 1808 he had also a second studio in West End, Upper Mall, Hammer-smith. TURNER removed to Queen Anne Street in 1811 and in 1815 his riverside address was Sandycombe Lodge, Twickenham. It would take us too long to analyse such a vast number of paintings. TURNER was willing to depict English scenes or Classical subjects, and occasionally he made experiments which were at least curious. For instance, in 1807 one of his paintings was "A Country Blacksmith disputing upon the Price of Iron, and the Price charged to the Butcher for Shoeing his Poney." TURNER purchased this picture from its owner twenty years afterwards. In 1808 he adopted another strange title, "The Unpaid Bill, or the Dentist reproving his Son's Prodigality." An experiment was made by him in 1831, for his "Watteau, studied by Fresnoy's Rules," was an endeavour to demonstrate that "white, when it shines with unstained lustre clear, may bear an object back, or bring it near." In 1843 his "Light and Colour" was supposed to exemplify GOETHE'S theory. Mr. GRAVES is careful to give the extracts introduced in the catalogues from "Fallacies of Hope," the curious lines which TURNER composed to suggest the character of his paintings. The last works he exhibited in 1850 were "Mercury sent to admonish Æneas," "Æneas relating his story to Dido," "The Visit to the Tomb," and "The Departure of the Fleet." Each of them was accompanied by a sentence from "Fallacies of Hope," but this time it appeared as a prose composition.

GEORGE FREDERICK WATTS commenced exhibiting at the Academy in 1837 with two portraits of young ladies and "The Wounded Heron." In 1840 he attempted the subject of "Isabella and Lorenzo;" in 1842 he had a scene from "Cymbeline;"

in 1849 a design for a fresco. His "Good Samaritan" of 1850 must have surprised people, for WATTS announced that it was "painted as an expression of the artist's admiration and respect of the noble philanthropy of THOMAS WRIGHT, of Manchester." But during several years his contributions were mainly portraits.

Few artists were so loyal to historical painting as E. M. WARD. His first contribution in 1834 was a portrait of O. SMITH, the player, as DON QUIXOTE. In 1839 he began the series of historical subjects which were continued until 1877. Mrs. E. M. WARD worked in the same line from 1858. JAMES WARD, the animal-painter, exhibited from 1792 until 1855. His career was therefore equal in length to TURNER'S. Another veteran was THOMAS UWINS, whose works were familiar to visitors from 1803 to 1857. The eighth volume would support the theory that exhibiting is favourable to longevity. BENJAMIN WEST'S "Departure of Regulus from Rome" and "Venus lamenting the Death of Adonis" appeared in the first of the Academy exhibitions, or 1769, and from that time until 1819 there was only one year in which the American painter was an absentee. RICHARD WESTALL'S paintings and drawings were to be seen from 1784 to 1836. WITHERINGTON was an exhibitor during fifty-two years and WILKIE during thirty-six.

It is to be regretted that among those of honest painters one name has to be introduced which would be apposite only in the "Newgate Calendar." THOMAS GRIFFITH WAINWRIGHT, the murderer, who was a friend of CHARLES LAMB and DAVID WILKIE, was an exhibitor in the Royal Academy in 1821, 1822, 1823, 1824 and 1825. He exhibited two scenes from "Undine," one from "Der Freischütz" and one from TASSO'S poem, "Paris in the Chamber of Helen" and "The Milkmaid's Song." DE QUINCEY confessed that he was interested in the man's judgments on the great Italian painters and the chief Italian engravers, and his manner gratified the Opium Eater at a time when he was misanthropical.

The architects whose names appear in the eighth volume are not, with few exceptions, as distinguished as those in the earlier volumes. WILLIAM TYLER, the Academician, was a sculptor as well as an architect. But among his works were the Duchess of GLOUCESTER'S villa near Kensington, a design for the town hall at Bridport, the goal at Dorchester, a belvedere to be built in a shrubbery, and a garden front of a villa. He was a foundation member, but he does not appear to have gained much renown. Another forgotten exhibitor was G. VARDY, who may have been related to JOHN VARDY. He contributed a "Design for a Banqueting House" and "A Public Building." LEWIS VULLIAMY exhibited in 1822 a design for a court of a palace. In 1830 and 1832 there were drawings of his Law Institution, Chancery Lane. In 1837 and 1838 he exhibited the Royal Institution; mansions for Lord PORTARLINGTON and Sir G. T. STAUNTON; Christ's Church, Woburn Square, and a church at Highgate were other contributions. Although living until 1871, Mr. VULLIAMY did not exhibit after 1838. THOMAS LARKINS WALKER contributed buildings from 1837 to 1841. They comprised the Royal Berks Hospital; Camp Hill House, Warwickshire; church in Spicer Street, hospital at Bedworth, church at Attleborough, and church at Friar's Mount, Bethnal Green. He was induced to seek fortune in China, and he died in Hong Kong in 1860. R. WALLACE exhibited in 1819 Cloncaird Castle and a mansion at Achans. In 1830 he sent a design for "Waterloo Gate, being an entrance into St. James's Park from the south termination of Waterloo Place, after the manner of the Propylea at Athens." SAMUEL WARE in 1799 began in the customary way at that time with a "Design for a Temple," to be followed by a "Temple of Fame, a national edifice to commemorate British heroism," and a "Design for a Nelson Memorial." In 1807 his work was more prosaic—a "Mill and Wool Manufactory." His design for Bethlem Hospital was hung in 1811, and in

* The Royal Academy of Arts: a Complete Dictionary of Contributors and their Work, from its Foundation in 1769 to 1904. By Algernon Graves, F.S.A. Vol. VIII., Toft to Zwecker. (London: H. Graves & Co., Ltd.; G. Bell & Sons.)

1814 a view of Lismore Castle, which was rebuilt under his direction for the Duke of DEVONSHIRE.

The late ALFRED WATERHOUSE began modestly in 1857 with a "Cottage erecting in Cumberland." Then in 1861 came a view of the Manchester Assize Courts. After another interval he reappeared with a view of the Manchester Town Hall, and then followed a more varied series of work than had come from one architect during the century of the Academy's existence, Gonville and Caius College, Cambridge; Eaton Hall; the Liverpool Seamen's Orphanage Institution; Owens College; the Court Chambers, Lincoln's Inn; the Natural History Museum; Iwerne Minster; the Prudential Insurance Offices; Pembroke College; shops in Piccadilly; Heythrop Hall; St. Paul's School; the Turner Clock Tower; the City and Guilds Institute; St. Elizabeth's, Reddish; St. Mary's, Twyford; Home of Rest, Liverpool; Cambridge Union Hall; Allerton, Cannes; National Liberal Club; Prudential Offices, Liverpool; Girton College; Infirmary, Liverpool; Liverpool University College; Hôtel Métropole, Brighton; the Weighhouse Chapel; Prudential Offices, Glasgow; Provincial Bank, Manchester; Yorkshire College; Provincial Bank, Piccadilly; Refuge Assurance Offices, Manchester; Prudential Insurance Offices in Nottingham, Edinburgh and Holborn; Christie Library; University College Hospital; Bank in Leeds; Surveyors' Institution; with various landscapes and views of ancient buildings, forming a remarkable collection and display of extraordinary artistic power.

WILLIAM WILKINS gained a travelling Fellowship at Cambridge in 1801, but although he travelled in Greece and Italy, he prepared no views of ancient buildings for exhibition. His attention was drawn to architecture at an earlier time, for in 1799 he sent a view of the entrance of Caius College, Cambridge, and a design for improving a nobleman's seat in Nottinghamshire. On his return from his travels he contributed designs for a college at Cambridge. He was largely engaged in University work, but in 1806 he had a design for the East India College and various other works. His design for the University of London was exhibited in 1827, and for the National Gallery and Royal Academy in 1835. His last works were in the exhibition of 1838. A man of a different class, who also made his first appearance in 1799, was THOMAS WILLSON. He obtained the gold medal in 1801 for one of those national memorials then in favour. In succeeding years he contributed designs for national monuments, royal pavilions, official residences, &c. The climax was reached by his last work in 1831, when he prepared the bold project of a pyramid cemetery for the Metropolis. The following description was given in the catalogue:—"The base of the Pyramid comprehends 18 acres, which being multiplied by the several stages to be erected one above another, will generate nearly 1,000 acres self-created out of the void space overhead as the building progresses above the earth." WILLSON, in this novel project, not only anticipated but surpassed the office builders of the United States. Another colossal scheme was seen in 1814, when JOSEPH WOODS sent a design for a palace extending 2,500 feet from Hungerford Stairs to Westminster Bridge. Some years earlier he proposed to construct a masonry bridge of a single span across the Thames at London.

The lists relating to the WYATT family deserve attention from students of heredity. Works of about twenty bearers of the name are recorded in the volume. JAMES WYATT in 1770 exhibited plans of the Panthéon in Oxford Road, and continued to contribute until 1799. His son, BENJAMIN DEAN, had drawings accepted in 1811-2. But his most important works were produced at a later time. There was also JEFFRY WYATT, who was better known by his assumed name of WYATVILLE. THOMAS HENRY WYATT and his brother, Sir MATTHEW DIGBY WYATT, were among the most distinguished representatives in the nineteenth century. As sculptors and medallists the WYONS have been also remarkable.

Having completed the record of the Academy, Mr. ALGERNON GRAVES at once undertook the preparation of the catalogues of the Society of Artists of Great Britain (1760-91) and the Free Society of Artists (1761-83). Both societies were rivals of the Academy, which, however, derived recruits from them. The catalogues are more rare than those of the Academy. Mr. GRAVES's efforts to preserve the history of the societies from oblivion is in keeping with much else which he has done in the cause of English art.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, in the premises at Tufon Street, S.W., Mr. Walter Cave, vice-president, in the chair.

The following gentlemen were elected as members:—Messrs. J. Quekett, H. Brewis, E. J. Hatherell, H. F. Chandler, C. E. F. Roe, J. G. Allen, J. S. Huxley, A. F. Bryan and F. Winton Newman.

A paper on the "General Tendencies of Modern Architectural Design in America and American and European School Work," written by Mr. R. Clipston Sturgis, F.A.I.A., of Boston, U.S.A., was read in his absence by Mr. Arthur Keen, who made the following prefatory remarks:—"May I say by way of preface that Mr. Sturgis, the senior partner in the firm of Sturgis & Barton, who has kindly written this paper for us, is an architect with a large practice in Boston, doing Government and municipal work in addition to the domestic work which forms the principal part of his private practice. He is vice-president of the Boston Society of Architects, a fellow of the American Institute and chairman of the Board of Schoolhouse Commissioners of the city of Boston. This Board controls the erection of the State schools, buys the sites, appoints the architects and employs the builders, and in his position as chairman Mr. Sturgis is intimately associated with many leading architects. As a younger man he spent one year in the office of a London architect to get experience of English work, and he has been many times since in England and on the Continent, so that he is well acquainted with English work and well qualified to compare modern American architecture with what is being done here."

Modern Architectural Design in America.

At the time of the break with the Mother Country architecture in that part of the country which was colonised by England was following closely on the lines of English work. At the end of the eighteenth century the magnificent architectural record of the Mediæval builders had become history, and archæology and Classic forms and Classic formula had taken the place of a vital art.

The revived Classic forms with their fundamental principles of proportion and symmetry were, however, by no means unsuited to the new conditions among which they found development. The growth of cities, with the obvious requirements of direct thoroughfares and economical use of ground, encouraged and gave reasonable opportunity for the symmetry of Classic planning. From the practical and economical point of view the regular plan commended itself on all sides, and the fact that it was the prevailing fashion on the Continent was sufficient to fix it firmly as the universally accepted method in America.

In England it had its wise and reasonable expression in innumerable buildings in city and country, and while the rambling and picturesque plan of the Elizabethan and Jacobean work will always remain, to the foreigner at least, the distinctive and altogether perfect expression of English domestic architecture, the houses built under Queen Anne and the Georges have a charming quality of homelike comfort which in its way is unequalled, and which, in its close adaptation to what one might call modern domestic conditions, was more reasonable than a plan based on feudal conditions.

This was the condition architecturally that set its stamp on the English colonies in America, and, inasmuch as we had not the wealth of the Mother Country, we followed the simplest and best expressions, and were under no temptation to imitate the extravagances of the more ambitious English examples. It was that charming house in the Close at Salisbury, and the host of examples that are in line with this work of Wren's, not Houghton or Blenheim, that guided the taste of the colonists. For a while after the establishment of the United States our architecture con-

tinued in a quiet and dignified way to follow the trend of matters architectural in the western world. The acts that made the United States an independent power were not acts of revolution in the ordinarily accepted sense. We had no quarrel with England's Government as a form of Government, but only with certain exceptional applications of it that were invented for our special benefit. When therefore we started to govern ourselves, a republican form of Government was adopted (we could not very well have had any other), but there was no radical change in our civilisation, our outlook, or our environment. The fine arts, architecture and literature have their proper place and their due prominence in such a social condition. With Jefferson, as with Washington, these things were a necessary part of the equipment of a cultivated man, and the cultivated man was the one who naturally belonged at the head of affairs. These conditions, however, did not continue with us. A variety of causes demanded and produced a type of man essential for the development of a country of whose resources Washington had but the faintest perception. A type of man who must combine the indomitable courage and perseverance of the pioneer with the shrewdness of the promoter, who must be able to understand what the resources and possibilities of the country are and to be competent to develop them. Such men had neither the time nor the temperament for that sort of cultivation which every gentleman of the first generation considered essential.

Even in the old world the period from 1830-70 was a dull time architecturally (to put it very mildly), and with us it was the abomination of desolation. Every kind of good precedent was thrown to the winds. Sound Classic precedent slipped into a spurious Greek executed in wood; Gothic, which had long been a terra incognita even to the cultivated, was explored by the ignorant and rendered in wood with the aid of the jig saw. Here and there were sporadic cases of fairly good work, but architecture as a whole was in a most deplorable state at the close of our civil war. In judging work of this period, however, it is only fair to bear in mind the special circumstances that differentiated the United States from the older Western civilisation. In the early days both economy and speed of construction favoured the use of wood and the necessity of clearing the land made it practically imperative. Following on good Georgian precedent, much good and exceedingly clever and interesting work was done. Stone precedents and examples were interpreted in wood with a delicate and charming sense of the difference in the character of the material. Thus wood came to be established as the common building material, and as long as good taste ruled and modest means limited expenditure the result was charming. But when men without cultivation or taste acquired wealth the temptation to extravagance and eccentricity resulted in work wholly bad; and these bad examples were received with popular approval and caused rapid deterioration in the perception of what beauty and truth really meant. Rapid growth of wealth and rapid expansion of the people into new territory made it impossible to build in any but the quickest way and the constant shifting of population encouraged ephemeral work. The contrast in the construction of railways in America and England is an excellent example of the necessities which forced upon America its methods. England, building for a compact and settled community, built with a view to permanency and safety. The United States, forced to build to serve scattered communities in vast unoccupied areas, with a sole eye to setting rails on which a train could run, built in the quickest and cheapest way; and it was years before there was time or money to consider better methods. In architecture it was the same story, and this accounts for, if it does not excuse, the amount of unstudied and vicious work done in the forties and fifties.

After 1865 with the establishment of peace and the rapid growth of prosperity people had once more a chance to pay some attention to the fine arts. There was an enormous demand for buildings, and those who in the seventies were thinking of architecture as a profession had the assurance that the well-equipped and well-trained architect had before him a great career. Our own architectural schools were in their infancy, but one or two had already begun to do good work at that time. The Ecole des Beaux-Arts at Paris offered the best opportunity for sound training. Our people have always felt kindly to France and have admired her position in the world of fine arts. To Paris then our students went to receive sound training on Classic lines. At the same time attention was again directed,

chiefly through English influences, to the value and beauty of Mediæval work. You know what that was in England, and how Ruskin and a host of saner followers of that great enthusiast reawakened in the hearts and understanding of all English-speaking people the marvellous treasures of the centuries that preceded the Italian Renaissance.

With eyes newly opened our people began to see the sound common sense beauty of the simple Classic work of our forefathers.

Queen Anne and Georgian work, and the buildings of the early days of independence, once more received the attention and reverence they deserved. A small but growing body of men began to stem the tide of horrors which had resulted from an ignorant and unreasoning demand for something new, something American, something which was not part and parcel of the effete civilisation they fancied we had left behind.

Added to this new self-respect for our past came a reawakening sense of the treasures of architectural history in Mediæval times. It was like discovering a virgin field, so long had it lain fallow, and it was entered on with the greatest enthusiasm. Students returning from abroad had their sketch-books packed with picturesque and often very cleverly drawn sketches of French manor and farmhouses, Romanesque work from the south of France, early Italian work, the vigour of Tuscan palaces, the subtle beauty and gorgeous colour of the south and of Constantinople, and the Gothic of France and England. It was a surfeit of good things, far more than we were able to digest. The result at first was a host of miserable failures, and to offset this a few brilliant successes.

The few successes were, however, a great stimulus to the students following and to those already at work. Each succeeding year saw the students begin work better equipped, and the men in active practice gained knowledge rapidly through great opportunities, and by failure as well as by success. A nation with so little in the way of architectural inheritance and with so few conservative tendencies must necessarily be open-minded to new impressions. The American student abroad is constantly envying the greater opportunities which Englishmen have. They envy them not alone nor chiefly for the architectural treasures that surround them at home, for the wealth of precedent that guides them aright in English ways, but for the handy Continent, France and Holland across the Channel, Italy but a few hours' journey further on, so that a short holiday may at any time put the English architect in the midst of the best examples of architecture in the western world. But, as a matter of fact, one is inclined to think that the American student, when he does cross the Atlantic, sees with more open eyes, and profits more readily from what he sees, and so is better off than the Englishman; nor need he really envy those who live in the midst of the treasures of the Continent. The Frenchman may go to Italy to study, but does not often trouble himself to seek architectural knowledge in England or Holland. The German may travel in France and Italy, but apparently profits little by such experience. But the American student goes everywhere with the eager eye of one to whom all is new and wonderful. No native bias, no prejudice, no conservative respect for the work of his own people hampers him in his study.

This is a great advantage. Another equally great is that architects in the United States are largely drawn from the class who have the means for a thorough education as a foundation. To limit a gentleman's occupation to the army, the navy and the church would be utterly unintelligible to an American. The church here undoubtedly holds an important place in the community, but that could not be said of the army and navy. Nor is diplomatic service as yet looked upon as an important and interesting field for the well-educated and ambitious man. Those who in England are by birth entitled to the best education are attracted to occupations which seldom tempt us. The result is that professions like architecture, medicine and the law are filled by the best educated men. Architecture as a profession is as highly esteemed as the law, and rather higher than the occupations which until recently were looked upon as the only ones available for an English gentleman's son. The students who go abroad are generally well equipped intellectually to take full advantage of the opportunities offered them.

The result of this with us has been twofold. The lack of established precedent and the wealth of ideas accumulated by study abroad has had the effect of urging our people to new effort, and our confidence in our great and

prosperous future has helped us to believe that we would develop a new style of architecture, something American, something quite our own. On the other hand, the study of the fine old examples has encouraged a sincere and deep-rooted admiration of the masterpieces of the past, and a wholesome modesty as to our ability to equal them by anything that does not follow closely on the precedents of the past.

Both phases have had their development here, and one is inclined to think that the sober sense of the present generation sees good in both points of view, but is far more governed by the former. That is, we may in time develop something especially adapted to modern use—the many storeyed structure on immensely valuable land may bring its logical solution. The modern methods of construction—the steel skeleton—reinforced concrete—may lead us to new expression; but, if we do so develop, it will be along the lines of the sound planning of the schools, the reasonable laws of construction and decoration that have been exemplified and proved in all the work of the past, and that has stood the test of time.

The best architectural work of the past decade in America is not new, is not American, but is conservative. More conservative, one ventures to say, than much of the work of France, with its Exposition style of architecture influencing work that is worthy of more serious treatment; more conservative than Germany, with its often grotesque strivings for an art that is new; more conservative than England, whose civic architecture has neither advanced Mediæval development from the point at which Pugin placed it when the Houses of Parliament were built, nor improved on the Classic sobriety and dignity of St. George's Hall in Liverpool.

American architects have been influenced more or less by all the architectural experiments of the Continent, and have had their own vagaries of experiment. Richardson dug into the treasures of Romanesque work, and conceived and executed one or two noble buildings with the spirit of the past and a certain modern vitality; but the experiments conducted by his numerous followers brought disgrace and obloquy on the style. Only in the backwaters of civilisation is it attempted now. The decorative motives of India and the Far East were taken by some as the proper form in which to clothe a skeleton structure, the ornament being truly superficial rather than structural—a sound enough theory. But the experiments along this line were more interesting than convincing. Modern French has set its rather loud and often vulgar mark on much of our municipal and domestic work in the great cities. The debased examples of this, however, have been such a warning to the leaders in this movement that the work of these leaders is tending to the quietest, simplest and most refined expression of French art; indeed, the best work of this class is almost more closely akin to the precedents of Italy—the Renaissance fountain-head—than to those of France. English Gothic, especially its collegiate phase, has found its expression here, and with the chastened memory of the early American barbarities in this style, and a grateful affection for such sound old-school examples as Trinity Church, New York, the development here has not departed much from sound precedent, but in a general way tends toward what might have been expected if Gothic had continued its natural course. It is, perhaps, needless to add that there has been much ignorant handling of this most difficult style.

The most discouraging tendency in American architecture to-day is its individualistic character. It is the natural outcome of our form of popular government, and it is one of the penalties we pay, along with untrained public service and ill-executed public utilities, for the uplifting effect on the community of popular control, for the self-respect and confidence engendered by the sense that each voter has of being a definite factor in shaping the progress and the destiny of his country.

The effect of the individual tendency is twofold: first, to encourage the expenditure of study, time and money on private projects, unhampered by limiting restraints, even those that are for the general good. The individual may exercise his taste and judgment, or give a free hand to the architect in whom he has confidence. The architect thus has exceptional opportunities.

On the other hand, the individual tendency makes directly against all work that has for its primary element the general good, and, consequently, we lack in America good examples of work which depend more on the execution of a well-considered whole than on the excellence of

detail. That our architects are able to handle well general problems of planning and composition was abundantly shown in the buildings surrounding the Court of Honour in the Chicago Exposition, and it has been repeated with more or less of success at Buffalo, Omaha and St. Louis. Such opportunities do not occur under ordinary conditions governing either Federal or large State and municipal undertakings.

The absolutely autocratic control of Napoleon made possible the reconstruction of Paris. The almost equally autocratic or independent County Council cuts great thoroughfares through London, and lays down conditions for the buildings which are to line them. The control of great properties in the hands of individual owners makes possible the systematic and uniform treatment of a given civic area. You think promptly of Cubitt and Belgravia, but there is something pretty distinguished there which Kensington lacks. There are things in Bath not often rivalled to-day in city streets or squares. No such conditions exist with us.

It may be said that France is now a Republic, and yet Paris has still laws which, by limiting cornices and sky-lines, produce the regularity which is almost the only thing needed to give dignity and distinction to a great thoroughfare. It may equally be said that the South American Republics in their great cities, Buenos Ayres and Rio de Janeiro, show a sense of general civic beauty which is not to be accounted for by autocratic control or large holdings of real estate. This is true, but France grew in Republicanism with a well-defined and established policy, and had sufficient taste to appreciate it. Brazil and the Argentine inherited the Latin outlook, which is primarily one of subservience to law and order; and temperamentally they, too, like the French, were sufficiently imbued with the love of art to appreciate this inherited tradition. England, from whom we inherited our architectural tradition, in common with most of the Anglo-Saxons, laid no great stress on general schemes of civic beauty.

It is, perhaps, not strange, but it is certainly deplorable, that America, with its many brilliant examples of individual or isolated works of architecture, should be so absolutely lacking in distinguished civic architecture. No autocratic power, either of an individual or of a group of men, has as yet been sufficiently interested in large architectural schemes as to insure their execution. Perhaps for us it is as well that there should not be and that we should turn, perforce, for support and encouragement to the people themselves; but I believe it is more than doubtful if this expression of art will ever be popular.

In view of recent developments we may await this issue with more patience and courage, for city after city has awakened to a sense of its lost opportunities in the past only to determine that those that lie in the future shall not be lost. Here, at least, we are reaping the benefit of the big exposition groups, and the lesson they taught of the value of concerted action, of standard dimensions and repeats, of a well-considered whole, in which the parts, while admitting variety, yet conform to the general laws controlling the whole. Most of these are still in the condition of beautiful drawings embodying fine ideas; here and there one, as in Cleveland, is already taking form. While we may not expect the public to imitate or even fully understand these plans, we must for their development depend on the people for support, and unless our ideas are rational and practical, and the average man can see some return for his money—beauty is beginning to have its commercial value—we cannot advance far in the solution of broader problems.

In our individual work, where most progress has been made, our incursions into a variety of styles has resulted in a pretty generally diffused knowledge, a somewhat quick recovery from the strained effort to do something new and different, and a restrained sobriety among our best men which is having its influence in moulding taste throughout the country.

On the whole, then, the general tendency of the best work in America is toward conservative lines, but in following this course one sees that intelligent use of precedent which shows that the stage of student and copyist is past, and that we are entering—slowly, but soberly and carefully—on the more responsible period of imaginative handling of well-understood laws. That we have learned that there are laws under which we work is a most important thing; once accept this and we have gained that perfect freedom which is possible only to those who have learned to obey.

The illustrations which are to be shown are necessarily

very few, and cannot be considered even representative of the vast architectural field in the United States. You have perhaps noted that I have said no word as to the old French influence and its architectural records in Detroit, St. Louis, or New Orleans, or of the Spanish work in California and on the Mexican border. These have had a strong influence, and especially the latter—the charming work of the Spanish monks on the Pacific coast. Some of the slides will show modern interpretations of this.

With the exception of the first few slides the work shown is nearly all quite modern. These few early slides are simply to show the kind of thing we had in Colonial days, a type familiar enough in England, but very cleverly adapted for execution in wood here, and what we were doing in the early days of independence. The gloomy architectural period from then up to modern days might have been shown as a warning, but that no body of English architects needs.

The CHAIRMAN said they must thank Mr. Keen for explaining the slides to them, and also for the admirable way in which he had read the paper.

Mr. LOUIS AMBLER, in proposing the thanks of the meeting to Mr. Sturgis and Mr. Keen, said that the latter and himself were perhaps the only members of the Association present who knew Mr. Sturgis in the year when he was studying in London. They were in the same office, said the speaker, and it was interesting to hear Mr. Sturgis's views on American architecture, though it was a little doubtful whether they would quite agree with their own. He regretted the author had not shown any photographs of his own work. Many of those present he thought would remember having seen the illustrations of some of the American buildings before—certainly those of the firm of McKim, Mead & White, which were brought to their notice when Mr. McKim received the Gold Medal of the Institute. It was interesting to see how some of the buildings had developed from Spanish examples; but in some cases the architects had adopted more the characteristics of the Italian school. Mr. Ambler said it was noticeable that Messrs. McKim, Mead & White had based most of their building on Italian work, and suggested that the nearer their building got to the beauty and proportions of the original the better it was. He was surprised to hear in the reading of the paper that the American architects had not the same opportunities for doing buildings in a grand manner as English architects. Mr. McKim, when he was over here, had led them to believe there were opportunities in America for treating large open spaces and developing important sites. The libraries in America were certainly built on large, square and open sites—much more so than in this country; in fact, said Mr. Ambler, the laying-out of their sites seemed to be more on the lines of continental cities, such as Paris, Munich and Berlin, and yet Mr. Sturgis, in his paper, suggested that it was otherwise, and that the Americans had not such opportunities.

Mr. MATT GARBUTT seconded the vote of thanks and said, from the views of some buildings he had seen exhibited at the recent Architectural Congress, he was under the impression that Americans had great chances for laying-out buildings on a grand scale.

Mr. W. H. LEVERTON supported the vote of thanks.

The CHAIRMAN, expressing the thanks of the meeting to the author of the paper and Mr. Keen, said it had been very interesting to see so much American work, but having heard how hastily it had to be produced he felt glad he did not practice in America. He had been told that as many as one hundred men were employed in some architects' offices and that drawings had often to be prepared and issued within a few days owing to the keenness of competition. In America 75 per cent. of the profits would go to meet office expenses, or, in other words, out of 5 per cent. fee on his commissions the architect only made one-quarter for himself.

Mr. KEEN, briefly replying, said that though the conditions under which American work was produced might seem inconceivable to them, yet he thought they had seen on the screen that evening examples of architecture which were worthy of the Americans.

Mr. George Clausen, A.R.A., will deliver the annual address to the students of the Birmingham Municipal School of Art and distribute the prizes on the evening of Thursday, February 14, in the large lecture theatre of the Midland Institute.

THE DESERT TOMBS OF BAHREIN.

EXCAVATIONS are in progress by Captain Prideaux, C.I.E., the British Agent at Bahrein, under the instructions of the Government of India, on the fringe of the remarkable desert tombs which stretch for miles and miles in the interior of the island. A special correspondent of the *Times of India*, who has been touring in the Persian Gulf, visited the scene of excavation and describes these mounds, stretching away as far as the eye can reach, as constituting the most gigantic cemetery in the world, and as probably also the oldest and the earliest burying-ground of the human race still in visible existence on such a scale. Yet comparatively few people know of its existence; the literature dealing with it consists solely of a few allusions in the works of classical geographers, a report or two in the records of learned societies, and a chapter in a book by the late Mr. Theodore Bent. Mr. Bent thought the mounds were of Phœnician origin, but the correspondent gives reasons for holding them to be of still more ancient origin. Primitive civilisation first began in this region in all probability, and possibly this desert sepulchre is the oldest piece of man's handiwork now existing in the world. The mounds nearest to the village from which the necropolis is approached are 50 feet high, but the vast sea of mounds beyond is made up of tombs from 20 feet to 30 feet in height. The few excavations so far made, confined to the higher mounds, show that each tomb consists of two large chambers, one above the other, built of vast blocks of stone. There are side chambers and passages, and the interior is neatly covered with layers of cement. First, the chambers must have been constructed, and then the tomb was covered over with compact layers of earth and small stones, very many feet thick, thus forming a mound capable of withstanding the flight of many ages and not giving the slightest hint of what lies within. The masonry is cyclopean in character and perfect of its kind, but no marks of mason's tools are discernible. Not a vestige of an inscription has been discovered anywhere. The work of excavation is very difficult, but, despite the obstacles met with, good progress has been made by Captain Prideaux, who has already accumulated a large collection of fragmentary relics. A scientific report will, no doubt, be issued by the Government of India in due course.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THIS Association, desiring to commemorate its Jubilee year, has arranged to hold an exhibition in the rooms of the Royal Scottish Academy, Edinburgh, during July and August 1907. The exhibition will be limited to work executed in the course of the past fifty years by Scottish architects, with the addition of such old or special work as the committee may consider of sufficient interest. An interesting incident in connection with the exhibition is the forthcoming visit of the Royal Institute of British Architects during the period of the exhibition.

It is desired to include in the exhibition photographs and drawings of work that has been completed, and the committee will have discretionary powers to admit exhibits of the applied arts, as designed and controlled by the architect, if available floor space permits.

Architects and others who have photographs and drawings which they consider of sufficient interest to be included in the exhibition will please communicate with the exhibition secretary, Mr. John McIntyre, architect, 28 North Bridge Street, who will furnish further particulars.

It is proposed that a guarantee fund be raised in connection therewith. The total sum desired is 300*l.*, and it is intended to limit the guarantee of any member of the Association to one guinea. If the exhibition is well patronised there may be no deficit, but should such occur and only part of the guarantee fund be required, the guarantors will be called upon to meet same proportionately. The guarantee of a guinea or any smaller sum may be intimated to the exhibition treasurer, Mr. W. G. Walker, C.A., 39 George Street, Edinburgh, and it will be esteemed a favour if this is done on or before Monday, February 4.

Mr. John Burnet, A.R.S.A., has been appointed assessor in the competition for the buildings to be erected for the Scottish Exhibition, which will be held in Edinburgh next year.

NOTES AND COMMENTS.

ANOTHER move has been made in the action respecting the claim of the late Mr. MACKISON for fees connected with extraordinary duties performed by him as burgh engineer. Although the claim was reduced from 49,000*l.* to 15,000*l.*, the Town Council endeavoured, in the first place, to obtain a decision that there was no case. They were not successful. Another effort was made this week to bring the action to a premature end by advising the Town Council to offer a sum of from 3,500*l.* to 4,000*l.* in settlement of the claim. When it is remembered that the Council when they first heard of the claim, treated it with contempt and dismissed an old and faithful official on account of it, the readiness with which, by a voting of 19 to 3, the proposal to offer the money was adopted is enough to suggest that the Council have no fixed basis on which to stand. The claimants should therefore hesitate before they accept the offer. Apart from their interests, which no doubt are important, it is desirable that the Courts should formally decide whether municipal engineers and other officials are to be paid for services which were not supposed to be comprised among the duties they were engaged to perform.

ALTHOUGH the circumstances of modern life in France do not appear to be favourable to long life, yet many of the artists attain an age which is considered as venerable. It would be difficult to decide who is the NESTOR among them. FÉLIX JOSEPH BARRIAS, the painter, who died on Saturday last, won the Grand Prix de Rome in 1844. In those distant days young men were able to conquer, and BARRIAS was only twenty-two when he succeeded. Three years afterwards he exhibited in the Salon and obtained the usual third-class medal, to be followed in 1851 by one of the first class. NAPOLEON III. patronised him by purchasing his *Exilés de Tibère*. It was as a history painter he went to Rome, and he continued faithful to that class throughout his long career. Governments and theories of art might change, but BARRIAS was an ultra-conservative, and there was little difference between the student and the professor. He was one of the very numerous pupils of LÉON COGNIET.

A GREAT many people in England have long believed that the difference between theory and practice is not to be overcome. We may consider it as no more than a prejudice which originated in the peculiarities of English education. A man might stand high in a college for his knowledge of mechanics, and in course of time he might become a professor of the science without being able to realise the connection between his problems and machinery. Men of that kind were not to be blamed. They were simply upholding the tradition which had come down to us from the Greek and Roman philosophers. It is not the office of philosophy, said SENECA, to teach men the use of their hands. Her business is to form the soul, and he considered that the making of transparent windows or the heating of a building was only fitted for slaves of the lowest class. Happily all such nonsense has ceased to be respected unless in some very wealthy institutions intended for men who need not trouble themselves about foreign competition. The grand intellectuals of a past age would be horrified to find that a faculty of commerce has been introduced in some of the new English universities. Birmingham has not only one, but the Council have departed from all precedent by forming an advisory board, which consists solely of gentlemen who have the closest connection with business affairs. The members of the board are Mr. NEVILLE CHAMBERLAIN, a director of a metal company, &c.; Mr. CLAUGHTON, a director of railways, banks, canals, waterworks, gas companies, ironworks; Mr. DUDLEY DOCKER, director of a carriage company and a small arms company; Mr. A. H. GIBSON,

a director of W. & T. AVERY, LTD., and other companies; Mr. W. E. HIPKINS, the managing director of W. & T. AVERY, LTD., and other companies; Mr. J. S. TAYLOR, the chairman of the Birmingham Chamber of Commerce; and Mr. T. SIDNEY WALKER, director of the Metal and Munitions Company, &c. All are connected with local industries, and their experience will be utilised in aiding in the training of students in order that they may become efficient leaders of industry.

As Ravenna is comprised in the circuit of cheap tours, the buildings are known to more Englishmen than in BYRON's days. The old buildings are interesting to architects as examples of the Byzantine style. The theory of a Syrian origin for them was lately maintained by Professor DÜTSCHKE before one of the German societies. Romanesque art, according to him, should be considered as Christian-Oriental art. He cited MARTIAL as evidence that prior to the Christian era Roman culture was being orientalised, or rather, Syrianised. Both Egypt and Asia Minor were among the influences. In Ravenna a part of the city was called "Armenia," owing to the numbers of merchants who inhabited it. Professor DÜTSCHKE compares the cultural movement to the ebbing of the tide which carried ALEXANDER THE GREAT to India. He finds resemblances between the Syrian churches and those of Ravenna, and the Mausoleum of GALLA PLACIDIA may have been derived from an example of the third century still existing in Asia Minor. In the symbols and sculpture he also traced a Syrian influence which passed from Ravenna to other parts of Europe.

THE leases of the old houses forming St. George's Terrace, Gloucester Road, W., having nearly all fallen in, the site, which has a frontage of about 400 feet and a return frontage of about 170 feet to St. George's Place, and covering an area of nearly 1½ acres, is being cleared. By arrangement with the London County Council and the Kensington Borough Council an important street improvement will be carried out. The new frontage of the site will be utilised for the erection of a number of blocks of shops and flats, the plans of which have been prepared by Mr. PAUL HOFFMANN, Palmerston House, E.C. A new feature will be introduced in the shape of roof gardens on the first-floor level, the upper part of the premises setting back considerably behind the line of shops.

THE *Discobolus*, or quoit-player, by MYRON, was always recognised as one of the great works of sculpture. Several copies were made of it, and one is in the TOWNLEY collection of the British Museum. But they do not all agree with the description which LUCIAN professed to give of the original. According to him, the figure was "bending forward in the attitude of throwing, with the head turned back towards the hand that holds the discus, one knee gently bent. The figure appears ready to rise as soon as it has discharged the discus." According to Professor Rizzo, the world has now been enriched by another ancient copy, discovered at Castell Borziano, in a small garden belonging to one of the old villas. Unfortunately, the statue was broken; but the fragments have been collected, and the important parts of the head, the right arm and the feet can be completed. The Professor has compared the parts obtained with the figures in the Vatican and other galleries, and has come to the conclusion that it was one of the best versions of the famous figure.

WANDERINGS IN CENTRAL EUROPE.*

SOME of you know the excitement the lover of art in any branch has when his dream of years is about to become a reality, and he is to see a great work at last; if so, you have tasted one of the greatest pleasures of the traveller.

Illustrations and photographs are now to be had so cheaply, and every corner of Europe has been sketched and photographed so often, that there are few spots that really surprise us; but an impression is gained by the actual seeing that no plate can give. I should like to inspire everyone (particularly students in art) with a longing to wander through Europe, for I think that in most men a real desire to do anything is a distance along the road to its accomplishment. I myself, at eighteen, without a pound to call my own, made up my mind to go abroad on my first trip, in four years' time, and I estimated what I should require, and, strange to say, in time and expenditure I had correctly foreseen. Travel is better than the money it may cost, and no one can take the memory from one so long as he lives.

After hard work in England and France, we retired for a month to Switzerland, and there, nearly a mile and a quarter above sea-level, enjoyed a most delightful rest before descending into Germany.

On my previous visit I had crossed the Alps in the depth of winter, up to my neck in the snow, and nearly died in the process. The lakes were voyaged sitting on the engine boilers, and Switzerland was quiet, lonesome and dreary, but now the sun had shone and transformed everything; the whole country was full of life and clothed in summer, with rich growth about us, trees laden with brilliant red, purple and white berries; the stately pines, grand and beautiful, had shaken themselves free from their burden of snow, and in perfection gave their dark green as a contrast to the lighter shades of the other trees. Here and there a simple square tower, capped with a graceful octagonal spire, with heavy bell-casting eaves projecting far, gave a little architectural interest.

The eternal mountains we soon left behind us, and we were steaming across Lake Constance with the freight cars towed astern, and a little later we were on a German train leaving Switzerland, but not her chalets, for far from the border the houses are of the same type. My run up the Rhine never seemed to me like Germany half as much as this approach to the fine city of Munich. The chalets gradually became plainer—in fact, often like a great box with a roof over, doll's-house fashion; the graceful spires were gone, for on the German towers stand cupolas, more like inverted onions than anything else I can call to mind. The Greek church tower seemed to be in its infancy.

The country was a good one, but beyond these features and a well-laid railway track, there was little of interest until we arrived at Munich, and though it has one of the finest collections of art treasures and a population of 200,000, to us Australians it is almost unknown, or, to say the least, unrealised.

Naturally our first steps took us to the great Pinacothek, treasure houses of paintings of new and old masters, and they are enough to satisfy any hungry soul. Here was a feast indeed worth the study of weeks, nay, months and years. The buildings themselves are an example of what picture galleries should be, not vast chambers, but a series of rooms suitable to the size of the works exhibited.

Here, as throughout most German cities, the secessionists have founded their own special gallery. While these galleries do not possess, when compared with the old ones, much of a very high standard, yet the work done is admirable. It has taken centuries to gather the older collections, and can it be expected that a new set of artists, striking out on new lines, could in a few years gather pictures to compare with collections the choice of all the best for hundreds of years? True it is that many of their works are decidedly bad, and often deserve the extravagant criticisms that they receive. It is sometimes hard to understand how such art absurdities, both of composition and execution, are allowed to be hung; but, with the mass of mediocrity, there stands out an occasional jewel that is worth the whole secessionist movement's efforts. I was much charmed with the excellent taste displayed in small pieces of furniture and ornament, and as the galleries are not intended for their reception so much as for the pictures, only good examples are exhibited, sometimes not more than one or two in a room of thirty pictures.

* A paper read by Beverley Ussher at a meeting of the Royal Victorian Institute of Architects.

The whole secessionist movement is a striving to get away from the bonds of tradition, and many patrons are willing to sanction modern notions in place of mere copying of old and famous styles of painting and architecture. This new art is no longer on its trial, but, in my opinion, it has come to stay, and perhaps to lay the foundation of a new and living style.

The great German exhibits at the World's Fair in this style were never extravagant or devoid of reason, but proportion and utility were hand in hand, producing a harmonious whole, a delight to the eyes, full of luxury, and having the very essence of beauty.

It may be that the life of this movement depends upon a few great men; but it is sincerely to be hoped that what happened in America, after H. H. Richardson's death, will not be repeated in German-speaking cities.

Had America followed up the great Richardson's lead there would doubtless have developed a style well worthy of the nineteenth century; but, alas! they lacked the ability or the inclination to follow, and the States only possess a few beautiful American Romanesque buildings, and the style is looked upon as out of date, and Renaissance methods are generally adopted. The hope is that the German movement, being general, may prove its saving.

We are now in the empire of William II., whose personality is extraordinary, and whose untiring energy and genius are pushing a once second-rate Power into the forefront of the nations. As a boy his motto was, "If I rest I rust," and now new inventions and discoveries in medicine, in telegraphy, in electrotechnics, in postal service and in naval architecture all receive his appreciation, and he spares neither time, pains nor influence to use them for this nation whose head he is. In art, and particularly in this secessionist movement, the Emperor has shown the same vigour and used his influence. It is strange that for the exterior of buildings he has done his utmost to crush it, yet for internal work he has been a patron. The forty furnished rooms at the St. Louis Fair were said to have been personally supervised by him. The great feature of these was a thorough blending of colour with neutral or half-tints predominating, sinuous, graceful lines in ornament and hangings; the lines following the fancy of the craftsman, with no attempt to copy nature or even suggest objects from nature. Every piece of furniture was fully suited and shaped entirely for its place. It was craftsmanship at its best, and the whole seemed the result of a master mind. Thus Germany is slowly but surely creating a distinctive art of her own. The scum is still on the surface, but soon the world will awake to see an art new, vigorous and full of beauty and delight. The taste of the people themselves is on a high standard, at any rate, judging by the paperhangings exhibited in the shop-windows, which are, by-the-by, a very fair indication of the common taste. In England and America the majority of wall-papers are not well designed. In Germany even papers of 3d. and 4d. a roll are fit for first-class work as to style, drawing and colour.

Fergusson praised German Classic homes, but predicted a great downfall in their architecture, which prophecy became only too true; for those who neither followed the Classic lines nor the secessionist breaking away have developed (particularly in the capital) a base, fantastic, distasteful style, without sign of education or original genius, filling street after street with otherwise grand and costly mansions.

Munich perhaps of all cities needed a breaking away the most, for seldom do you find such examples of copyism as here. Almost, one might say, it is a museum of examples of buildings of note, reproduced copies of the Pitti Palace at Florence, the well-known Loggia in the same place, and even the Parthenon at Athens are here, and some of them in stucco. No wonder that there has been a recoil of thought. The Germans have copied everything, no matter how unsuitable to their uses. The secessionists aim at copying nothing. I do not wish to be misunderstood. If you travel this country through you will see few good examples of this new work without searching, and it must not be forgotten that the secessionists' work has been carried out best in interiors, and there are few exteriors worth looking at, and many examples are full of extravagant absurdities, and without other merit than originality.

The great beer gardens and cellars are among the first sights of the place, and even the works of art in her fine galleries are not enough for you to see if you would do Munich properly.

This fine capital of Bavaria is well worthy of the usual

German pride, for no people are so capable of conducting the growth and upkeep of their cities.

Again we are speeding towards Nuremberg, and more into the heart of Germany. The absence of the country seat or nobleman's château was noticeable; in fact, from the Adriatic to the Baltic there are practically no fine mansions nor comfortable houses like the middle-class home-steads that cover England.

Women are everywhere to be seen working hard in the fields, and it is no strange sight to see them with their high tapering baskets filled to the brim with some weighty merchandise, and in the cities with their shovels mixing mortar, and doing many other things that we consider only fit for men.

Nuremberg is perhaps the quaintest and most interesting Mediæval city of Europe; yet when one arrives at the railway station there is nothing about it to suggest that you are at its gates. Within a few yards the old tiled roofs of every conceivable pitch and angle, broken by innumerable little turrets and slit dormers, can be seen stretching from wall to wall, and all through this ancient town are found fine specimens of ironwork, sculpture and carving, to say nothing of famous pictures and drawings. Wherever a town in any country, ancient or modern, has been blessed with good examples, whether handed down by antiquity or inspired by a great architect, the result is, as a general rule, a higher standard of excellence. Nuremberg for centuries has guarded her beauty. Her citizens even in these days of commercial utility have with pride tried to retain something of its character in new works.

It had always been a dream of my life to walk her lanes, with all their twistings and turnings, and to become familiar with this town of roofs. We often forget that in picturesque architecture the roof plays the most important part. One of the first buildings one sees after passing through the gates is the huge corn market, sometimes called the "Giant's House," with its many storeys, a great gable at each end and one at each side, being otherwise devoid of breaks. Half of the storeys are in the roof, and though this building is severe yet it is an example of what size and simplicity can do.

These grain houses are noble structures. Little in ornamentation is allowed excepting to gables and entrances. The whole speaks its purpose so well that it is easy to guess its use. Though a mere unadorned storehouse, it stands forth and asserts its claim upon public admiration. You can see such simplicity particularly in the glorious old houses of Hildesheim, Rothenburg and Brunswick. Ernest George and Norman Shaw in many of their works have charmed us in the following of methods inspired by their travels in the old cities of Northern Europe.

To illustrate this grand simplicity let us examine the Weinstadel with the older Wasser Turm water tower, sometimes called the hangman's tower, because the town executioner used to live in a house (the Henkersteg) on the graceful covered bridge which spans the river Pegnitz.

The strength of this defending tower, combined with the picturesqueness of the venerable looking inn, with the quaint single storey connecting them, make a composition indeed worthy of the imagination of any artist. This is the very heart of Nuremberg, and with the undulations of the city as she rises from the river banks, we can catch perhaps some of the most wonderful roof scenery to be seen anywhere. Here also we note the simplicity of the chimney-stacks and the multitude of attics.

The little Pegnitz and her many bridges allow glimpses of uncommon beauty. The picturesque houses are on the water's edge; the stream is full of fish, but none of them are allowed to be drawn; nevertheless the children cannot resist the sport, and the culprits, detected, go off to the watchhouse and are punished. Wherever you wander there can be seen evidence of a high standard of craftsmanship. Her workers in metals, cutlers, casters in bronze, and her goldsmiths were considered the most cunning and skilful in Europe. To-day Nuremberg may be called the world's toy shop, but not that she has altogether lost her art for more serious manufacture.

The modern, well-designed Jewish synagogue, on the bank of the river, while incongruous with the general surroundings, brings home to us the history of these much persecuted people. Their treatment was so terrible that only their vitality could have withstood it, or have dared or have afforded to erect so good a building. They were subjected to all kinds of insult, were restricted in every way, were obliged to don a peculiar costume, to shave clean and to keep to their own quarter. But even this was not

enough; they were blamed for deeds never theirs, and in 1349 were cruelly massacred. The Nurembergers, becoming jealous of their usual prosperity, and a rumour having gained a hearing that they had poisoned the town wells, they were driven out to the site of the Maxfield Park and there burnt to death. Their whole quarter was destroyed, their synagogue and cemetery not even being respected, and for hundreds of years they were not allowed in the town.

Owing to this clearance the fine market-place was made way for. There you can see numbers of large umbrellas shading the stalls. These have been handed down from generation to generation.

A few years later the Frauen Kirche was built on the site with a history most unchristian. A feature of this church is the procession of mannikins placed on top of St. Michael's Chapel, and worked by the clock.

The fountain, 60 feet high, deserving its name, "Beautiful Fountain," is one of Nuremberg's treasures, though just at present it is suffering from over much colour decoration. Crossing one of the bridges I came upon one of the beauty spots, and, placing my camera on the parapet, I photographed the strangely-built hospital carried upon a bridge, and legend lends enchantment to this view. Its founder was wealthy, but suffered from a painful disease for which he could find no remedy. In a garden outside the city he dreamed that he saw the gleam of some jewels on the ground. He felt to pick them up, but, as they faded away, he heaped some leaves to mark the spot. Feeling convinced that this was a sign from heaven, he vowed that he would build a hospital if he ever found them. The day following, in his own garden he saw a heap of leaves, and very soon he had dug deeply and unearthed a chest of jewels and gold hidden in war time. The first patient cured him of his skin trouble. Konrad's recumbent effigy beneath a massive slab, borne by eight kneeling patients, is a fitting testimony of this good man's gift to Nuremberg.

To ramble around the walls of this once well-fortified city is a great pleasure, and no matter how callous the sightseer may be, he must be impressed with the ever-changing loveliness of its gardened ditch, with its roofed-over walls crowned with numerous towers of all shapes, which dominated the surrounding country.

In this ditch every citizen had a finger, for every man, woman and child was obliged to work one day in the year, find a substitute, or pay ten pfennings.

The castle should have been mentioned first, for the name Nuremberg may be made up of the words Nur ein Burg, only a castle, and perhaps when the Burg was built, with its five-cornered tower, the castle was all that there was of the now ancient town. It was occupied by aristocrats, overawing the townsfolk, who were so subjected to the raids of the young burgers that they erected the four-pinnacled tower (Lugisland) to keep an eye on the aristocrats' movements.

The churches of Nuremberg are treasure houses of art, the finest being St. Sebald's and St. Lorenzo.

The Lutheran church of St. Sebald I saw crowded with scaffolding inside; but, notwithstanding this, there was enough free to show how well it had been carried out.

Legend says that the saint was laid in this spot, where then stood a church dedicated to St. Peter. When St. Sebald died his body was put into a cart drawn by unbroken oxen, which were allowed to wander in search of a resting-place. Whether through the sniff of the marketplace near by St. Peter's or guidance from above, we cannot tell; but at any rate, here this saint's bones were deposited. Three times the townsfolk removed the body, only to miss it and find it again where the oxen had chosen.

St. Sebald's is in several styles of Nuremberg Gothic, early and late. In 1361 the original chancel was pulled down and replaced by the present beautiful eastern apse, which follows the French plan. The nave is the oldest portion, and the towers of the fifteenth century. There is no harmony of east with west, no gradual leading up from simple to late Gothic, no history of every generation, as so often seen in our English cathedrals.

One is apt to forget the purpose of the church, and is likely to think only of Peter Vischer's masterpiece, in the most elaborate tomb of St. Sebald. It is not only one of the treasures of the church but of Germany itself, and some go so far as to say that it is the most perfect piece of metal work in existence. For twelve years the famous iron-worker, aided by his five sons, toiled to produce this shrine, and without other than voluntary payment, which did not

amount to much. It is borne on twelve large snails and four dolphins, and is enriched by figures—apostles and others—about seventy in all, including the grave and the gay, and even children at play. The base is enriched with bas-reliefs, and the whole is a canopy of imperishable metal, sacred to the memory of the saint so revered.

One of the later-date features of the church is the bridal door, with a decided German Gothic cusped and traceried canopy, all most suitably designed, with figures of the wise and foolish virgins on either side.

The oriel of St. Sebald's parsonage is very beautiful, but time will only allow of mention.

The position of the fine church of St. Lorenzo, being more open, has the advantage over that of St. Sebald's. It is not to be expected that (whatever may be said in favour of German Gothic) it compares with the purity, loveliness and beauty of detail to be seen west of the Rhine; but St. Lorenzo recalls French methods, especially in its fine doorway, 40 feet high. As a whole, the conception is grand, and a look at its details adds greatly to its charm, and for a doorway, even in the west, it has seldom been surpassed.

The whole illustrates Bible history. We see the Virgin, the childhood of Christ, the Passion, the Crucifixion, while Our Lord, with the sun and the moon at His feet, judges the dead who rise from their graves, and are also depicted in heaven and hell. The two-thirds proportion of the whole doorway taken up by the carved tympanum is extraordinary.

The masterpiece of Adam Kraft is here to be seen in the famous florid Gothic tabernacle. Kraft, kneeling between two of his assistants, supports, with their aid, this tall pyramid of stone, 65 feet high, which, when reaching the vaulting, heads over like a plant checked in its growth towards the light. While this work to us is extravagant, its detail foreign to our way of working, and its parts not constructional, yet it is a most graceful and pleasing piece of stone carving of rare minuteness of detail. Adam and his apprentices worked for five years on it.

One of the most famous and perhaps the most world-wide-known relic in Nuremberg is the little inn, the "Bratwurst-glocklein"—in English, the little bell of the Fried Sausage. The bell used to be rung when the sausages were ready, and its history goes back 600 years. It clings like secular buildings often do in Europe to a chapel, and that a mortuary chapel. Contrast the jolly life with the mourning of the bereaved. Here Dürer, Vischer, Veit, Stoss and Hans Sach we may imagine eating their daily sausage, while they talked over the doings of Martin Luther. Folk have flocked from all parts to sit in the very seats occupied by great artists long since gone.

The Rathaus, with its dreadful dungeons, can tell many a story. It and the castle, and even the outside of the town in several directions, are connected by underground passages. The courtyards of Nuremberg are good, particularly this one at the Rathaus.

On a fountain near the Spitalplatz is a figure of a bagpiper, and the story of how he got there is amusing. Nuremberg in those days needed a sanitary system, and, for want of it, the plague used to run riot. The bagpiper, greatly beloved, started on his way homewards, no better for his good time than a brother piper from Scotland. Falling asleep in the track of the plague cart, which came heavily loaded with the dead, the ox and horse drawing this awful hearse hesitated to go over him. Promptly the driver lifted the piper on to the top of the cart. The roughness of the cobbled streets made the fellow sit up. All his screams did not impress the driver, used as he was to dreadful sounds, so he kept on his way. Remembering his bagpipe, he played, and he received the notice of the undertaker and, full of fright, he was allowed to get down and go home a changed man.

The Nuremberg stations of the cross are also by Adam Kraft, though most of them have been restored. One Kilzel discovered that the distance from his home on Thiergarten Platz to the entrance to St. Johannes Cemetery was the same exactly as the road from Pilate's Judgment Hall to Golgotha. Kraft was employed to carry out seven bas-reliefs in stone to mark this way that our Saviour carried His Cross, and a large Calvary with full-sized figures was placed inside the cemetery. These bas-reliefs were set up on great pillars two hundred paces apart. Kilzel's home now retains the name Pilatus House; but, alas! little is left of these works of Kraft's. Albert Dürer's life and name seem to be bound up with the town. The artist of Germany and the delineator of the world, painter, sculptor,

engraver, engineer, mathematician, and ardent Protestant reformer, why he seems more the patron saint than St. Sebald in the hearts of the Nurembergers. He was a noble character, his walk was upright, and he was early to accept the teachings of Luther. He was a man in a million. Alas! the town has lost many of the best of his works, but they are to be seen scattered throughout the great galleries of Europe. His home is preserved as nearly as possible as it was in the days when the master occupied it.

Opposite St. Lorenzo stands the sixteenth-century Nassau House. A fine specimen, with its plain walls, its beautiful oriel and carved balcony, and its graceful turrets and roof. The group of buildings here, St. Lorenzo, the Nassau House, the picturesque houses adjoining, while far away down the hill turret after turret grows out of the vast cloud of red roofs, make one of the most interesting spots of this splendid old town.

This Nassau House, which is almost uninjured by time, is one of the noteworthy monuments of German secular architecture of the Middle Ages, probably finished in the fourteenth century. The oriel and the angel are fifteenth century, placed there to mark a visit of Sigismund in 1424.

A fountain here is an interesting specimen of German Renaissance at its best. A better known one is the goose fountain of the market-place, with a figure of a man holding a goose under each arm, and from each mouth squirts the water.

It is hard to leave Nuremberg without even speaking of more notable spots and buildings, and a few words must be said of the Germanic Museum and its treasures of art. This old monastery, transformed by the Reformation into a museum, contains many most interesting exhibits, and, arranged in a picturesque Gothic cloistered building, they are enhanced. Some of the old German heavily-timbered rooms were particularly good. The courtyard, with its well, makes an interesting picture.

On Saturday afternoon we left Nuremberg for Rothenburg, another once strongly fortified town. The railway ran through a part of the country which gradually grew more interesting; sights of beautiful forests, rich undulating lands and quaint villages passed away the journey quickly. At about sunset we were outside one of the quaintest places I have visited, with practically no sign of anything modern, and completely walled around, with all the gates especially strengthened; some of these entrances are so well guarded that no fewer than four gates must be passed before one is actually within the town. One of these, the Marcus Thurm, is said to be 1,000 years old, and it is still in a state of almost perfect preservation.

Rothenburg reminds me very much of some of the Mediæval towns of Italy. Like Orvieto and Siena, it is built on the crown of a hill, or group of hills, and one always has an extensive view of the beautiful surrounding country from the walls. The church, or cathedral, and the Palazzo Publico, or Rathaus, are in the centre, and from the market-place the streets wriggle outwards, and to follow these in any direction in a few minutes the sightseer is on the walls or through the gates.

The Rothenburg Rathaus is a very interesting structure with Gothic lines; it was erected in 1240, and the portion facing the market-place (a Renaissance front) was added to it in 1522, after a destructive fire which destroyed half of the old building. Tradition says that the fire was caused through the spite of a pair of storks that had built a nest in the old belfry. Incensed by their litter the janitor's wife one day flung the fledglings into the street while the parent birds were away. The old birds' distress was very great on their return. That night a fire broke out near by, and one of the birds was seen to pick up a brand and carry it to the nest in the belfry, for the tower was soon ablaze and the janitor and his wife perished.

From the tower three times a week a chorale is played with a verse for each quarter of the compass. When a wedding occurs there is often an extra performance, and in case of death at sundown the sad tidings are conveyed in the solemn notes of a hymn.

The Franciscan church, eleventh century, is the abbey of Rothenburg, for there rest the great leaders and patricians of the town, which fairly bristles with legends and memories of noble deeds.

That Sunday was one never to be forgotten, for devoid of excitement of any kind the whole place breathed peace. The kirk bells rang out loudly, calling the folk for miles around to their abbey and echoing through the hills. From the window of our homely little inn, which had likely been there for centuries, we looked out upon the Gothic

side of the Rathaus. A few yards away at the end of the street there is a strange garden, the walls of which are built on the edge of the rocky declivity that ends the tableland upon which the town stands, and here after church the town band played, as German bands can play, and the townfolk walked about for an hour. In the afternoon we went beyond the walls, where the slopes are covered with gardens, with seated winding paths, and often the trees are laden with ripening fruit, the property of the municipality, untouched by the pilfering schoolboy.

Walk where you will in and about Rothenburg there is inspiration for an artist. Old gabled houses, sometimes dangerously toppling, and beautiful nature, combined with the life of these gentle folk, are here to relieve the monotony of the up-to-date modern cities.

But, however great our pleasure to stay, we could not linger too long if our programme were to be carried out, so the following Monday found us in the train going towards Austria.

The German agricultural country seemed poor, and as if every nerve had to be strained to get the full value out of it. Before we reached Passau we had skirted the Danube for many miles, but when we crossed the mighty river into Austria the change was wonderful and almost immediate, for instead of passing through fields poor-looking, we were for hours in what might have been a lovely park, with all kinds of beautiful trees and the lawn carefully mown. We should do well to copy Austrian tree-planting laws; some obligation on the part of every owner of a block would transform our suburbs into parks. Here and there were women and children with sickles cutting the grass and gathering it to make hay, but all in such a neat, tidy fashion as not to detract from the garden-like appearance. Shall I say that at last I had found a country which for beauty and spick-and-span upkeep surpassed dear old England? At any rate, as we approached the Austrian Tyrol the scenery became the most beautiful of any I have seen in temperate climates.

We reached Salzburg at dusk, and now, while we are at comparisons, we might say that if any town compares with Edinburgh it is Salzburg, with its castled hill dominating the pass 700 feet below, where rushes the fine river Salzach.

The climate was delightful, and all our meals were served under the elm trees of our hotel garden.

Leaving Salzburg, the railway took us through scenery growing more beautiful—the gurgling, dashing, quarrelling river, now alongside us, now beneath us; the mighty hills, bare, rugged, snow-capped, either richly wooded or rearing sheer up to the heavens from the very banks of the stream. For a ride or a walk to Zell am See you cannot equal this road anywhere that I know of—beauty mixed with grandeur, and then the lovely lake, where we took train for Innsbruck. Walking down her main streets we were struck by the contrast between the several-storeyed buildings and the bold-fissured limestone mountains towering above the town and dwindling everything into insignificance. Here one Frederick of Tyrol, better known as “Empty Pockets,” wishing to refute the impeachment of poverty, erected a gilded roofed Late Gothic balcony in 1425, costing him 14,000*l*.

Another thing of note is the tomb of Maximilian, in the Franciscan Church, which almost fills the nave, and one again wonders if the building has lost its original purpose in the worship of an emperor. On each side are lined up large bronze-armoured knights—Maximilian's contemporaries and ancestors, two of them by the great Peter Vischer, of Nuremberg. The bas-reliefs surrounding the tomb, representative of the life of the Emperor, are wonderful. He can be easily recognised in the different periods of his life. This is said to be the most perfect work of its kind.

Adjectives are useless in describing the track from Innsbruck through Botzen to Italy. Rising 4,490 feet to Brenner and we were on the watershed from which the two rivers flow away—one east, the Danube, to the Black Sea; the other south, the Po, to the Adriatic.

As we descended into Italy the scenery underwent a great change, and so did the people—neither for the better. The Germans, clean and respectable, were replaced by dirty, rowdy Italians, and to be yarded into a Customs shed on a hot day with them was most unpleasant.

The beautiful Tyrolean Alps have gone, and the plainer, barren Italian hills are around us. The vineyards have begun, and many of their beautiful arbours, with their fruit hanging ripe and purple beneath, cover acres. Again there is a change, and the vines are festooned to fruit trees, a

chain apart, with fields between. The hilly country is left behind, and we are heading east, round the grand old towers of Verona, and passing Vicenza and Padua we approach the Queen of the Adriatic.

THE ART OF F. WALKER, A.R.A.

THE art of Fred Walker was the principal theme of Professor von Herkomer's address on the 24th ult. at the Royal Academy, and the England on whose rustic charms the lecturer dwelt so lovingly was the peaceful rural England of the painter of the “Harbour of Refuge,” “The Bathers,” and the “Marlow Ferry.” The Professor said that twenty-five years ago he should have smiled at an attempt to speak of the loveliness of England, because in those days it was expressed by the art of the time. English painters then still saw it with English eyes, and there was still existing a connection between them and such artists as Gainsborough and Morland, who led the way to David Cox, to William Hunt, to Walker and to Mason. There were many ways of expressing in art the charms of rustic England—the village life, the lanes, the blue distances, the flowered hedges and the cottages that commercialism had not yet destroyed, but the misfortune was that the young modern painter tried to avoid it. It was said that it was hackneyed as a subject, and hackneyed perhaps it had been by second-rate painters. The pinafore-girl had been, for example; but then see what Mason made of her. After a poetic description of the delightfulness of an English village and the character of the faces of the English peasants, the lecturer, according to the *Morning Post*, said that in his opinion their variety of dress was for the artist a good feature. With the French peasant the cap was too marked a note; instead of painting a face you paint a cap with a face in it. In England we saw the individual, not the costume. Turning to the peasant of Millet, Professor von Herkomer caused some amusement by trying various pronunciations of the French painter's name, and saying finally, “We'll English him, and call him Millet.” So of Millet—pronounced as spelt—the lecturer proceeded to say that he expressed the peasant because he reduced to a minimum the peculiarities of the costume. But Millet produced only the peasant that appealed to him, a downtrodden peasant without a face, without a hope.

Walker and Mason saw in the English peasant both a face and a hope, and to both would have been impossible the realism of some pictures painted since the change of type from an essentially English art to one evolved by foreign painters. It was only the modern painter who filled his eyes and nails with clodded earth, and got no further, and the change was not a gain for England. Walker may be said to have been the creator of a revolution in English art by his combination of the antique with rural English life. He was a man nervous and sensitive to the last degree, and perhaps would never have completed a picture if need for money had not compelled him to work. Rarely—and then only to a few trusted friends—would he show anything unfinished. When he was in the country and his pictures had to be packed to go to London even the carpenter never saw them. He would tell the man to leave the case in the passage or in the studio, and then send him away, while Walker himself put the picture in with the back outwards, leaving nothing for the carpenter to do but to screw down the lid. Walker worked with Whympere the engraver, and helped to cut some of Thackeray's drawings on wood until he tired of this and wanted to do work for himself. The engraver took him to Thackeray and explained matters, and the novelist, taking out pencil and paper and giving them to Walker, turned his back on him and said, “Draw me.” Walker drew the back of Thackeray, who was so pleased with the sketch that he gave the young engraver a chance, and the illustrations to “Philip,” in which the influence of John Gilbert on Walker can be traced, were the result.

Walker in his illustrations reproduced his mental type again and again, and this might be called mannerism. But all originally tended to mannerism, and the painter of strong personality does not fall into the error of copying his model, who is only a means to an end. And Professor von Herkomer told the story of an art student known to Diderot, who before commencing to paint from the life knelt down and prayed, “The Lord deliver me from this model.” Walker's “Bathers,” though badly hung at the Academy, had a great effect and showed that he could produce something new in a field that had been much traversed. He

brought into all his work the freshness that made illustration interesting in those days. His technique in oil showed the influence of his early work in illustration and water-colour, and with the troubles that faced an oil-painter, educated as he was, the lecturer said he himself had had experience. The man who only worked in one of these mediums found his range limited, as a subject might be suitable for one and not for the other. He compared them with music—water-colour the strings, oil the full orchestra. Mason's range was wider than that of Walker, and their period was epoch-making. It was a fine point, however, whether Walker would have done more had he lived, and whether his curiously sensitive nature would have been prepared to face the new conditions of things that had since come about. The picturesque—"comedy in art," as it was defined—and beauty next were touched upon, and the lecturer speculated upon the reasons why the tumbled-down, the damaged, the unsymmetrical should lend themselves as they do to the painter's art. Who was to say what beauty was and whose ideas on the subject should be accepted? Show Rossetti's maidens—his idea of beauty—to the Philistine and he would say the girls had niggers' lips, looked crazy and were obviously in need of a holiday. After a passing reference to the value of expression, without which mere physical beauty soon palled, and a flattering comment on the work of Du Maurier, the Professor concluded an interesting address with an appeal to the students. "See England," he said, "with English eyes, and proclaim with your art that England is one of the most beautiful and paintable countries in the world."

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the rooms of the above Society on Thursday, the 24th ult., Mr. E. Nichols read a paper on "Gothic Sculpture as applied by the late William Burges, A.R.A." Mr. H. S. Chorley, president, was in the chair. The lecturer said:—I have great pleasure in coming to Leeds to talk about William Burges, because were I to give this lecture to a London audience they might ask what had he done that we can see? I should tell them to go to Cork or Cardiff, whereas here in Leeds, Studley Royal Chapel and Skelton Church are within easy reach. The memorial chapel at Studley Royal suffers, I think, from being too near to Fountains Abbey; what is left of the Abbey is so grand and reposeful, while Studley Royal Chapel seems too small for the amount of over-decorated detail. Skelton Church stands alone; there nothing is forgotten, even to the holy well in the churchyard. Burges loved these things, detail, animals and colour. He said in a paper on the mural paintings of Chalgrove Church, Oxford:—"The interior of every old building invariably glowed with richest gold and colour and every village church was a Sainte-Chapelle or a St. Stephen's, Westminster, according to the general run of antiquaries." Thus he wrote to the Society of Antiquaries in 1861. I have never been able to make up my mind on the subject of painted sculpture; the South Kensington authorities have recently added some carved and painted Gothic spandrels, which are splendid and most effective, but time, I feel, has much to do with it. My slides are mostly animals. Mr. Burges gave to the British Museum an ivory dagger handle in the form of a lion's head, and which is now in the Assyrian Gallery. I have a cast of it with me; this small lion's head and the Assyrian winged bulls appear to have inspired him in his treatment of animals. He never perpetrated a Gothic lion. He designed many lions, but always of an Assyrian character. The four Evangelistic emblems on a ground of gold mosaic surrounding the great rose window of Cork Cathedral are distinctly Assyrian or, rather, Babylonian in style.

Cork Cathedral was his *magnum opus*, and it was barely completed when he died twenty-five years ago. The central doorway with a figure of the Bridegroom between the five wise virgins and the five foolish virgins is a most original and daring treatment. Of all the Gothic revivalists Burges was the only man who got humour into his sculpture, and surely there was a strong sense of humour in Gothic. I do not mean the comic or merely grotesque. Take, for instance, the large gargoyles on Cork Cathedral, "Chastity subduing Lust," "Faith piercing the eyes of Idolatry," "Pride and Humility," "Avarice." In Burges's own house in Melbury Road, Kensington, he had a grammar chimneypiece, where all the parts of speech were

carved, noun, verb, adverb and all the rest. The slides I am showing to-night are taken from the original models made by my father, the late Thomas Nichols, with the exception of those made from the drawings, &c. I have a few of the architect's original sketches, and you can see in the actual working out by the sculptor how wonderfully the two men worked together in perfect sympathy and accord. My original intention was to exhibit models, but I do not think that all Pickford's staff could have got them here, therefore I must depend upon the lantern.

A vote of thanks to the lecturer was carried.

COMPETITIONS IN GERMANY.

IN a letter to the *American Architect* Mr. Gustavus Staehlin writes:—Thinking it might interest your readers, I have translated some of the "principles" governing competitions in Germany as formulated by the United German Architects' and Engineers' Societies in 1897, and revised by the Thirty-third Convention of their delegates in Düsseldorf in 1904.

They have, first, competitions open to all the world; second, for Germans only; and third, limited to architects residing in certain districts, where probably home pride exists, or where a thorough knowledge of the "terrain" is absolutely necessary to solve the problem properly. Then they have "limited competitions" in the sense of our "big five," where each competitor receives remuneration and the names of the competing firms are made public. (That the standard of professional ethics would be raised by the selection of these "big five" by the aldermen of most of our cities I can only imagine.) The German code recommends a "sketch competition," first, *i.e.* for all larger buildings, a competition of ideas, at a scale of 1:400 and 1:200, and then a limited competition between the competitors successful in the first struggle, at a scale 1:200 up to 1:100.

The code insists that the number of judges in competitions must be uneven and that the majority of them must be architects, and that the programme must be agreed upon by all the judges and their substitutes before its publication. The architects selected as judges are men of reputation who have gained their position by winning just such competitions and by erecting buildings of importance themselves. They are judges to-day, competitors to-morrow.

The judges must follow this procedure. The entire board examines and decides which sets of drawings are entitled to consideration; whether the requirements, as to time of arrival, cost, &c., have been fulfilled, and also weed out the palpably inferior designs. The remaining drawings are then thoroughly examined by the technical members—the architects—of the board, never less than two passing on each set of drawings, and judgment thereon is reported to the entire board. The eliminating and sifting of designs by the entire board proceeds, and is continued until the number of remaining designs equals the number of prizes given. Usually a majority decides the elimination of a design. The judges must publish the reasons governing them in making the awards, and must furnish each competitor with a copy of them. All drawings, together with the verdict of the judges, must be exhibited publicly for at least eight days. The most prominent architects in Germany have no hesitancy in entering open competitions thus safeguarded, and it frequently occurs that unknown men carry off the prizes. No one man would consider himself competent there to decide anything more than a school competition among students. No less than *tres faciunt collegium*, and they must be architects.

THE LLANDUDNO TREASURE TROVE.

A COLLECTION of Roman bronze coins was lately found near the Little Ormes Head. Mr. Willoughby Gardner, of Deganwy, the president of the Llandudno and District Field Club, having been asked for his opinion upon them, said that he had not yet had an opportunity of carefully examining them. I have seen, he said, nearly 500 of them for a few moments in a rather dark room at the police station, but that would not of course suffice to justify a definite opinion. It will be necessary to have the coins cleaned and to classify them carefully. In addition to the 500 which I saw, there may be 150 knocking about which have been picked up or acquired by different persons. Accounts are conflicting as to how many were actually found, and as to the box in which they were enclosed, or the

remains of which were found at the same spot. I have seen portions of a bronze case which seems to have belonged in some way or other to the "find." The men who have these fragments are holding on to them as though they were gold. I should like to get them all together so that we may photograph them, and this we may do later on.

It may be well (Mr. Gardner continued) to correct one or two misconceptions which have got about in reference to the discovery. There are the remains of buildings near the spot, but they are the ruins of a Mediæval farm, and can have nothing to do with the hoard, which consists almost entirely of coins minted by Carausius, who usurped the throne of Britain in 294. The Christian inscribed stone at Bodafon has been referred to as indicating a Roman occupation of the locality. The idea may have arisen from what was said by me in a recent lecture, when I showed photographs of the stone and indicated that it was a sixth-century Christian tombstone. The inscription upon it is in Latin, but it has no other connection with Roman times in Britain. Nevertheless, there can be no doubt that the Romans worked the copper mines of the Great Orme, and the coins may have been brought here as wages for the men employed or pay for the soldiery. In fact, hoards of Roman coins have been very frequently found in the last fifty years all along the Welsh coast, and also in the valleys, such as those of the Clwyd and the Conway. Not very far from Llandudno, some years ago, there was a remarkable hoard of not less than 5,000 Roman coins found, of which I have some. News of this piece of good fortune did not reach the general ear, but collectors are well aware of it. I consider that the law which the police very properly felt it their duty to act upon in regard to the present "find" is a very unfortunate one for the archæologist, for it leads to the destruction of many gold and silver coins and other ancient things which would be of priceless value to the student, but which are of comparatively little value when melted down and sold to the jewellers. Finds of coins and other treasures are constantly made in Ireland, and it is said that the practice of the finders is immediately to melt the metal down and dispose of it to the goldsmith or silversmith in the neighbouring town. This destruction of archæological material of which so great scientific use might be made is deplorable.

As to how the recent hoard came to be where it was hit upon so unexpectedly, the explanation is probably very simple. There were no banks in those days, and men who saved either money or bullion were obliged to hide it. Very often they would choose some spot, such as that where this store was placed, where there would be some stone or other object that would enable them to find the hiding-place readily. Often the hidiers would die before they recovered their property, and there it would lie all through the centuries until chance revealed it. I have indicated how very numerous Roman coins are, and you will see that they are of no great value in the market as curiosities. It would be a pity to give the men who found the Llandudno collection an exaggerated idea of their value. The only curious feature of this hoard is that the coins are all, as I have said, with one or two exceptions, those minted by Carausius. As a rule, hoards are composed of a wide variety of coins. When I come to work out the Llandudno coins I may be able to explain how it is that they all belong to Carausius, who, by the way, issued an extraordinary number—some 300 altogether—of different coins during his seven years' reign.

TESSERÆ.

Samuel Cooper.

THIS miniaturist, who was born in 1609, owed great part of his merit to the works of Vandyke, and yet may be called an original genius, as he was the first who gave the strength and freedom of oil to miniature. Oliver's works are touched and retouched with such careful fidelity that you cannot help perceiving they are nature in the abstract; Cooper's are so bold that they seem perfect nature only of a less standard. Magnify the former they are still diminutively conceived; if a glass could expand Cooper's pictures to the size of Vandyke's, they would appear to have been painted for that proportion. If his portrait of Cromwell could be so enlarged, I do not know but Vandyke would appear less great by the comparison. To make it fairly one must not measure the Fleming by his most admired piece, Cardinal Bentivoglio; the quick finesse of eye in a florid Italian writer was not a subject equal to the Protector, but it would be an amusing trial to balance Cooper's

"Oliver Cromwell" and Vandyke's "Lord Strafford." To trace the lineaments of equal ambition, equal intrepidity, equal art, equal presumption, and to compare the skill of the masters in representing the one exalted to the height of his hopes, yet perplexed with a command he could scarce hold, did not dare to relinquish, and yet dared to exert; the other, dashed in his career, willing to avoid the precipice, searching all the recesses of so great a soul to break his fall, and yet ready to mount the scaffold with more dignity than the other ascended the throne. This parallel is not a picture drawn by fancy; if the artists had worked in competition they could not have approached nigher to the characters of their heroes. Cooper with so much merit had two defects. His skill was confined to a mere head; his drawing even of the neck and shoulders so incorrect and untoward that it seems to account for the number of his works unfinished. It looks as if he was sensible how small a way his talent extended. This very poverty accounts for the other, his want of grace, a signal deficiency in a painter of portraits, yet how seldom possessed. Bounded as their province is to a few tame attitudes, how grace atones for want of action. Cooper, content, like his countrymen, with the good sense of truth, neglected to make truth engaging. Grace in painting seems peculiar to Italy. The Flemings and the French run into opposite extremes. The first never approach the line, the latter exceed it, and catch at most but a lesser species of it, the genteel, which is familiar grace, as grace seems an amiable degree of majesty. Cooper's women, like his model Vandyke's, are seldom very handsome. It is Lely alone that excuses the gallantries of Charles II. He painted an apology for that Asiatic court. The anecdotes of Cooper's life are few, nor does it signify. His works are his history. He was instructed, with his brother Alexander, by their uncle Hoskins, who, says Graham, was jealous of him, and whom he soon surpassed. The variety of tints that he introduced, the clearness of his carnations and loose management of hair, exceed his uncle, though in the last Hoskins had great merit too. Another capital work of Cooper, the portrait of one Swingfield, recommended the artist to the court of France, where he painted several pieces larger than his usual size, and for which his widow received a pension during her life. He lived long in France and Holland, and, dying in London, was buried in Pancras Church. Graham adds that he had great skill in music and played well on the lute.

Italian Terra-Cotta.

Clay during a long period was not only used for the purpose of solid construction in Italy, but also moulded into forms so exquisite as to take its place as a material of high value and dignity in art. So rich is Lombardy in early works of terra-cotta as to be fitly called by Hope the "great country of brick." Among the most ancient remains of the kind are the crypts of the church of Lenno, on the lake of Como. There sundry relics are still extant of colossal statues in terra-cotta of a close-grained and tough consistency, all of which are considered to belong to the constructions of Christianity. The use of terra-cotta followed the fortunes of successive schools of art in Italy. Both in sacred and secular architecture it enables us to trace the development of taste. The golden period of the art was marked by a wise sobriety and simple severity of ornament, with a scrupulous care to confine the material within its appropriate limits of style. In the hands of the gifted architects who flourished along with Lucca della Robbia, that pre-eminent modeller in terra-cotta, ceramic ornament entered into all that was purest and most noble in the arts of design. Crema, Chiaravalle and, above all, Pavia, were the headquarters of the graceful school. At Milan, in the Ospitale Maggiore and the Castiglione palace, were exhibited the arabesques and medallions of the cinque-cento period. In the subsequent age, in the hands of the so-called imitators of Michel Angelo, art overpassing the boundary line of truth lapsed into exaggeration. The severe, modest and delicate beauty of terra-cotta refusing to lend itself to the contortions and imitative tricks of the barocco or rococo style, the entire art soon fell into decay and eventual oblivion.

Iona Cathedral.

The earliest work at Iona has some manifest peculiarities; is it not likely that some light might be thrown upon them by a comparison either with Kirkwall or with Trondhjem? The later work is Scottish, as might be expected. The history of Scottish architecture is an excellent comment on the political history of the country. Up to the time of Edward I., Scottish architecture is essentially English. It

differs from other English work only as a dialect, as the Early Gothic of Ely differs from the Early Gothic of Wells. From the fourteenth century onward Scottish architecture becomes a distinct language; it has a character of its own, but a character coming much nearer to French than to English. Nothing can be more un-English than some of the fourteenth-century details, as the sedilia and the east window of the south aisle. The work of the twelfth and thirteenth centuries differs far less widely from English patterns. The church is small, the whole length being not much above 150 feet. It ranks then with the class of churches of which Brecon Priory is perhaps the finest, such as Chelsey, Ewenny, Leonard Stanley, the cathedrals of Killaloe and St. Asaph. Like all these, it is a cross church with a massive central tower, and like several of them, including Killaloe, it has no aisles to the nave. But small as the church is, it has been greatly enlarged since its first beginnings in the twelfth century. The eastern limb is now larger than the western; it has an aisle to the south and seemingly a contemplated aisle to the north. It was doubtless rebuilt, as was done in so many greater churches on a larger scale, in order that the ritual choir might be placed east of the central tower. No doubt, in the original Romanesque church it was under the tower. The belfry windows are very peculiar square openings filled with tracery. They may be compared to the windows in the middle stage of the East Anglian towers, and to the well-known domestic window at Clevedon Court. The monastic buildings lie on the north side, and present nothing remarkable in their arrangement. The refectory has a good range of lancet windows.

Scottish Gothic.

The first Pointed style is found in Scotland with many combinations of Romanesque features, and the stage of transition appeared for a much longer period than in English or French work. The style produced some of the most beautiful works that Scotland possessed. Arbroath and Kilwinning abbeys, St. Andrews and Elgin cathedrals and Holyrood Chapel afford perfect specimens of purity of design and beauty of execution that have never been surpassed in any other country, even in structures of larger size. These works have been said sometimes to resemble English, sometimes to resemble French churches. They do neither. They were designed in a more compact manner than in England; they are taller in proportion to their widths, the parts are smaller, they are united more to the adjoining ones, and have been studied more in relation to the parts that came next to them. While it is true that the plain flat soffits of the porches of Laon Cathedral are found also at Arbroath, yet, speaking generally, while there are certain resemblances, there are many features in French work that never appeared in Scotland, and many Scottish features not to be found in France. One of the most remarkable features of Scottish architecture, and one in which it greatly differed from either English or French, is that there were but two Pointed styles and not three. What is known as the Perpendicular style in England did not appear in Scotland. In its place there was a continuance of second Pointed forms, with certain variations in the design of the window tracery, at first not a little perplexing to the student. The beginning of the style had all the features of our own geometrical work, and the same stiffness in the design. Of this Glasgow Cathedral in its choir and also in the nave affords the largest and one of the best examples, and the progress of the designs to the first incipient example of open tracery—three lancets contained within a single window, a design not only graceful but very common—can be traced. The church of St. Monance, erected about 1369, has, with far more solidity of form so far as regards the structure, all the features of our own flowing Decorated style as regarded the patterns of the windows. The apse of Linlithgow, some few of the windows of Dunblane chancel, and the east window of Melrose have certainly upright lines in the tracery not unlike our Perpendicular style, and so far, but no more, there might be a certain resemblance. Yet the college chapel at Aberdeen, erected about 1494, had flowing Decorated tracery enclosed within a semicircular arch. Dunblane itself had flowing Decorated windows besides, and of the same date, and at Melrose the same thing might be observed to a far greater degree. Iona Cathedral is of early form, but its ornamentation is late. Corstorphine Church, founded in 1429, is also very early in appearance, but very late and curious in all its features. It is stone-roofed, showing an elaboration, but a continuance of the form of roofing of the earliest

oratories. Crichton Church is another early-looking church with a low tower, having the peculiar Scottish feature of a parapet-walk around it and a saddle-backed roof. Its windows have flowing tracery, but it was only founded in 1449. The design of the window tracery is infinite in its forms, and all of very great beauty—in some examples similar to English patterns, in some few to French ones. Statements have been made to the effect that these windows are Flamboyant in design, pure and simple. There is nothing but what any school of artists could work out for themselves, and a single man of genius would have individuality enough to introduce the use of such a feature as that to any style. Scotch work is full of such signs of personal design, and Roslin Chapel might be cited as the design of one mind following upon contemporary work. It is neither foreign nor English. Its lacework patterns here and there might find a counterpart in some Belgian work. Its heavy-pointed band vault might find a better one in many a Scottish castle, but the 'Prentice pillar and the general conception is nothing if it was not an individual design. The same might be said of the adaptation of the beautiful and peculiar crown on the steeple of St. Giles's, Edinburgh.

Imitation of Nature.

The rage for making everything assume a supposed appearance of nature was almost universal in England till lately. Artificial gardens were exchanged for others with serpentine walks; avenues were cut down or disregarded; the formal beds, balustrades and terraces of our old gardens were looked upon with horror, and every part of the ground about a house was required to assume the varied aspect of nature. At the same time, gravel walks, themselves artificial, were admitted; and if the rage was not carried quite so far as to allow weeds to grow instead of cultivated flowers, it was equally inconsistent to have the (supposed) wildness of nature about a house, which is a work of art, with its angularity and formal lines. It was a vain endeavour to make two opposite conditions coincide. To be in keeping with the aspect of a house the garden in its immediate vicinity should agree with its artificial character, and nothing can be more in accordance with the style of that work of art than an ornamental dressed garden, from which the gradation to the wild country should be maintained by a decreasing formality in the grounds as they leave the one and approach the other. "Nothing, indeed," as Sir Walter Scott has well observed, "is more the child of art than a garden," "and flights of steps, balustrades, vases and architectural ornaments," says Price, "are not more unnatural, *i.e.* not more artificial, than the house they are intended to accompany." The change from the old dressed garden was the consequence of the fantastic caprices of the Dutch (by whom it was caricatured) having been brought into England. A reaction then took place in favour of nature, and the opposite extreme of irregularity succeeded. But it was equally studied and unnatural, and as it was done without regard to adaptability and without a reason, the result was the anomalous juxtaposition of two incompatible ideas. The same is attempted in the colouring of works of art, and as it is equally inconsistent, it must equally lead to error.

The Certosa, Pavia.

The Certosa in Pavia is considered as one of the most beautiful buildings in the world, and may be cited to show how much more effect the appearance of riches and splendour had on the judgment of the multitude than fine taste and elegant proportion. It was begun in 1396, a period at which several splendid ecclesiastical structures were raised in Italy. The cathedral of Milan, the church of San Petronio at Bologna and the church of San Francesco at Assisi are all nearly of this date. The architect is said to be the same Henry of Zamodia or Gamodia who designed the Duomo at Milan. Malaspina supposes it rather to have been built under the direction of a certain Marco di Campilione, who disputes also the honour of the cathedral at Milan, but this appears to be a mere guess. There is a bust of the architect within the building, but without name or date. The style of the two edifices is so different as almost to preclude the possibility of their being the productions of one man, and the Certosa offers no indication of the taste of northern artists, while the cathedral abounds with them. The nave has four square divisions, each subdivided on the vault and with oblique groins. The groining of the side aisles is singular, each space being in fact covered with five unequal pointed vaults,

meeting in a common centre. Beyond the side aisles on each side two chapels open towards each square division of the nave. The choir and arms of the cross have each two square divisions, so that there are seven on the whole length of the church and five on that of the transept. The whole is in the highest degree rich with painting and gilding, and the orders of the altars of the chapels of the side aisles are of the richest marbles, while the altars themselves are of inlaid work in precious stones. Nothing is neglected. Even the washing place of the monks is a magnificent marble monument. The tomb of the founder, John Galeazzo Visconti, is said to have been designed in 1490, and completed in 1562, which is the date mentioned in the inscription. Circumstances might induce us to expect here one of the finest productions of the cinquecento, but this is not the case. The ivy represented on a door jamb just by is far more beautiful than anything in the tomb. The outside of the flanks and transept of the building is full of pinnacles and ornaments which do not rise naturally out of the construction of the building. The visitor becomes tired out with the interminable splendour of the edifice: every little part seems to say, "Come and admire me." There are two cloisters, one of which is of immense size, with marble columns and a profusion of ornamental brickwork, and there is a spacious palace of later date for the reception of visitors. The front was erected after the rest of the church, and is itself a distinct object. It was begun in 1473, from the designs of Ambrogio Fossano, and, as might be supposed from the place and date, is not Gothic, but an immense heap of little parts, in the taste of the cinquecento, often beautiful in themselves, but leaving no impression as a whole, except an undefined sentiment of its immense prodigality of riches. There are acres of bas-reliefs in figures and ornaments, often beautifully executed and never ill done. The material is marble throughout, but words cannot express the richness of the building, or the feeling of fatigue with which the visitor takes leave of it.

III—Effect of Science on Gothic Architecture.

As the stability of a Gothic church rested on a nice poise of mutually counteracting forces, so the maintenance of the style itself at its perfect point depended on a due balance of the intellectual forces which had generated it. This balance was soon to be disturbed. The fascination of the statical *tour de force*, the craving to bring down to an irreducible minimum the amount of material that would suffice to the stability of a building extravagantly lofty, was irresistible. Mathematical calculation played a daily more absorbing part, and resulted in the rearing of such a structure as the choir of Beauvais, which, presuming too much on abstract calculation, was so lacking in solidity that it gave way within a few years of its erection, was rendered relatively stable only by doubling the number of its supports, and is held together to this day only by a network of iron ties—a building which distresses by its stilted and meagre aspect, and lifts its vault to such a height that the eye cannot be directed to its summit without considerable physical discomfort. Another church, no doubt in its way beautiful, which exemplifies the training down of constructive forms to the last extreme of attenuation is St. Urbain of Troyes, in which the flying buttresses have the skeleton meagreness of iron girders, and the principle of external props is carried so far that two tiny vaulted porches at the north and south entrances think it necessary to provide themselves with flying buttresses standing out at either angle on the pavement. This building has the further peculiarity that it seems by some fissiparous effort to have split its substance into two layers, as though the outer church had been shed, so to speak, leaving another inner one intact and complete. Again, by the elimination of all idle portions in a structure of which the active portion is a skeleton, line becomes dominant through the omission of planes; lines were soon needlessly multiplied; narrow ridges first ran up the faces of the shafts, and then, as if convexity of surface was in itself a culpable waste, what had been a shaft was hollowed into furrows divided by an arris; concavity and rigidity invaded everything with an exasperating angularity of effect. An illustration of this is in the cathedral of Auxerre, where the choir retains the fuller forms and those of the nave shrivel into concavity.

Mr. Chatfield Clarke has been appointed a Land Tax Commissioner for the City of London.

The Durham County Council intend to apply for authority to borrow 127,548*l.* for the erection and alteration of schools.

GENERAL.

Mr. George Henry, the painter, was on Wednesday elected an Associate of the Royal Academy. By birth he is a Scotsman, and is a member of the Royal Scottish Academy, but from his parentage he was allowed to exhibit in the exhibition of Irish art at the Guildhall.

The Late Mr. William Whiteley, it was announced on Wednesday, has bequeathed about a million of money for providing almshouses.

The Top Stone of the Stockport town hall was laid on Wednesday in the presence of the architect, Sir Brumwell Thomas, and others.

The Archaeological Department of the Indian Government have taken in hand three old pagodas at Pagan, viz. the Nagayon, built in 1064; the Sulamani, built in 1183, and the Kyaukku, built in 1188, which have been secured against further damage from the weather at a cost of about 16,000 rupees. An outlay of 41,592 rupees for the repair and restoration of the Mandalay Palace spire has also been made.

The Next International Congress of Archaeology will be held about Easter at Cairo. A committee, presided over by Professor Maspero, is at present settling the details of the coming assembly, which will be attended by a large concourse from the world of light and learning representing both Europe and America. Alexandria and Thebes will also be visited, and possibly some excursions undertaken into the regions of Upper Egypt. The last congress, which met in 1905, had its assembly at Athens.

The Exhibition of the works of Mr. Holman Hunt at the Manchester City Art Gallery closed on Sunday. The exhibition has been uninterruptedly open for eight weeks—since December 4 last, with the exception of Christmas Day. On Sundays, however, the exhibition was open only from half-past two to five o'clock in the afternoon. The average week-day attendance has been about 2,300. The total number of visitors to the exhibition was estimated at 116,000.

The Avebury Estate, forming part of the Wiltshire estates of Lady Meux, has just been disposed of. It is situate 6½ miles west of Marlborough, and includes the manor-house, dating from the fifteenth or sixteenth century, and formerly a Benedictine priory. On the property are the remains of the Druidical temple of Avebury; it originally consisted of an outer and two inner circles of huge stones, some of which are still in position.

At Ardingly (Sussex) Parish Church a memorial has been erected to the memory of the Rev. J. H. Lee Booker, archaeologist. It is a brass tablet containing a list of thirty-nine rectors of Ardingly, dating from 1200 to 1875, when the present rector, the Rev. James Bowden, was appointed. The inscription runs:—"This list of rectors, prepared by the late Rev. J. H. Lee Booker, M.A., curate of Ardingly, 1883-8, is placed here in grateful recognition of the labour and research which he devoted to the history of Ardingly Church and parish. He died vicar of Elmbridge, Worcestershire, August 19, 1905."

The "Dublin Gazette" states that the Lords Justices-General have appointed the following gentlemen to inquire into the memorial of the Corporation of Waterford, praying for liberty to build a bridge across the Suir within the county borough, and alleging that the present wooden toll bridge is inadequate for modern traffic:—Denis B. Sullivan, K.C.; John Purser Griffith, Alexander M. Burden, county surveyor of Kilkenny; William E. L'Estrange Duffin, county surveyor of Waterford; and Edward H. Hackett, county surveyor of South Riding of Tipperary.

Holy Trinity Church, Exmouth, has been reopened after restoration. The scheme of restoration when complete will cost 15,000*l.*, the nave and lower portion of the tower, the first portion undertaken, having cost 6,100*l.* The work was begun in August 1905. One of the features of the new building is a triplet of arches in the west end, with highly ornamental arches nearer the base. The whole of the old windows have been replaced by new ones.

A Public Meeting was held last week in Birmingham to consider how the eminent services rendered to the city by the late Sir Richard Tangye and Mr. George Tangye can be permanently commemorated. It was then agreed:—"That the memorial take, firstly, the form of a mural tablet to be erected in the Art Gallery, the surplus, if any, to be applied to such purposes as may be found desirable to perpetuate the memory of the brothers Tangye."

The Architect.

THE WEEK.

WHEN the recommendation of the establishment committee concerning the competition for the London County Hall was brought before the meeting of the London County Council on Tuesday, objection was raised to the proposal by which one-tenth of the 5 per cent. commission was payable to the Council's architect. One of the members declared that a most dangerous precedent would be created, for henceforth the Council's officers might expect to be paid by commission on outlay. Another member said the business of the Council's architect should be confined to advising the establishment committee. The amendment was lost and the recommendation adopted. It is to be hoped no further obstacles will be created and that competitors may enter on their onerous task without any misgiving that only one section of the Council are eager to have the hall erected. A doubt of the kind would be embarrassing and unfavourable to creative power.

THE church of Steyning, in Sussex, dates from a very early age, and is connected with the legend of St. CUTHMAN. He erected a timber church, in which he was buried, and it is believed that the pilgrims who came to visit his grave were the cause of the creation of the village. By EDWARD THE CONFESSOR Steyning was attached to the diocese of Fécamp, in Normandy. There are Norman remains which must have belonged to the church which the monks founded. It was said that the original plan of the building was never fully carried out. According to EDMUND SHARPE, the series of pier arches is one of the most remarkable to be met with anywhere. The church does not appear as beautiful as it is owing to the galleries, which were erected about seventy years ago. It is now proposed to improve the church, under the direction of Mr. CLAYTON, architect, of Brighton. He proposes to remove the galleries which conceal the whole of the side windows of the aisles, and have their fronts carried across between and into the piers of the magnificent Norman arcades. The sloping ceiling of the gallery also obstructs and destroys the view into the church from the south doorway. This entrance, a beautiful Early Norman doorway, now has its stone moulding partly covered and surrounded by modern Portland cement, and the tympanum filled in with plaster. Mr. CLAYTON also objects to the bricked-up doorway on the north side of the fane which is to be opened. A simple oak door will be hung and a seat in the side aisle removed to make a gangway. Other improvements are the rearrangement of the seats in the tower and also the chancel, the latter of which works will bring the sanctuary into full view in addition to improving the accommodation.

THE establishment committee of the London County Council recommend that five additional assistants in the first-class and a similar number in the second should be appointed in the architect's department. At present there is a large unestablished staff, and it is considered desirable that a greater proportion of the assistants should belong to the established class. There has been considerable increase of work owing to the amendment of the Building Act. The committee have come to the conclusion that this work is of a nature requiring great skill and tact, and it is very necessary that it should be in the hands of experienced officials rather than that new officials should be appointed for it. They have accordingly selected for permanent appointment six assistants who have been in the service for periods varying from three to five years, and in two cases for nine and eleven years respectively; of these assistants,

five are employed in the Building Act and escape sections, two in the general constructional section, and one each in the fire-brigade, housing and highways sections. The assistants recommended are highly qualified for the technical work on which they are engaged, six of them possessing the qualification of A.R.I.B.A. The pay received by the assistants in question varies from 3*l.* 7*s.* 6*d.* weekly to 4*l.* 14*s.* 6*d.* The salaries would vary from 175*l.* a year to 245*l.*, being the nearest yearly equivalent in the scale to the weekly rates of pay.

ABERDEEN possesses a Master Masons' Incorporation, which is registered as a limited company. One of the rules is that no member can be admitted whose age exceeds fifty years, and besides he must furnish a certificate from a duly qualified medical man that he possesses a good average insurable life. In July 1904 Mr. LESLIE SMITH, master mason, was admitted a member of the body, but in March 1906 he resigned. Every member is expected to contribute to the funds, and the Corporation therefore asked for payment of 100*l.* or such other sum as might be found owing. Mr. SMITH claimed that the Corporation was only a trade union, and under the Acts of 1871 and 1876 they could not sue. He also maintained that the articles of association had not been complied with, as he was sixty-eight and had never been medically certified. The Judge, however, held that the agreement to become a member was a contract entered into between himself and the Corporation. His Lordship accordingly ordered Mr. SMITH, within fourteen days, to lodge a schedule of the work performed by him inside the boundary line round the city and suburban area of Aberdeen, in order that the subscription at the rate of 1 per cent. on the prices of the contracts payable by the defender as a member of the pursuers' Incorporation might be ascertained.

A THEATRE is about to be erected in Stockholm which, if successful, is likely to be imitated in other cities. It is intended for representation of native and foreign dramatic art, like the Shakespeare Theatre of Vienna. As the audience will be select there will be accommodation for only 500 spectators, of whom 300 will be in the stalls, 100 in the parterre or pit, and 100 in the boxes. The promoters do not believe that distance lends enchantment to the view, for the small stage will be as near as possible to the spectators. Colour is to be avoided in the interior; the woodwork as well as walls and drapery will be white. It is contemplated to allow painters to exhibit their works on the walls, and in that way to form an exhibition. The style of architecture is to be Grecian, and white stone will alone be used for the masonry. It is expected that the cost of the building will be about 14,000*l.*

AN exhibition of works by the late GUSTAVE ADOLPHE CRAUK was opened at the Ecole des Beaux-Arts, Paris, on Monday. One of his works, the fine statue of Admiral COLIGNY, the Huguenot leader, is well known to English visitors to the French capital, as it stands behind the railings of the Oratoire in the Rue de Rivoli. The position which CRAUK is to hold in the art of France has been much debated. He was a native of Valenciennes, and there is to be seen the large *Victory* which he produced by order of NAPOLEON III. a short time before the commencement of the war with Germany. He studied under RAMEY, DUMONT and PRADIER. He won the Prix de Rome in 1861. CRAUK was an exhibitor at the Salon in 1857, when he obtained a third-class medal, which was followed in succeeding years by others of higher grade. Among his works was a large *Combat of Centaurs*, the *Graces carrying Love*, and several busts.

THE HOUSES OF PARLIAMENT.

THE House of Lords is an important element of the British Constitution. Although that truth is admitted, the business of the Legislature has been conducted in such a manner during late years that very little is left for the peers to perform. It is therefore allowable that they should sometimes endeavour to assert their power. One opportunity was devised during the last session by the appointment of a select committee to inquire into the unfinished condition of that part of the Palace of Westminster assigned to the House of Lords, as well as the approaches thereto. No doubt the investigation which followed might be said to be merely academic. Although the noble lords may desire to possess a completed and decorated part of the building, yet they are without the power to raise funds to meet the expenditure. At the same time the evidence obtained by the select committee will bear comparison with that of the Fine Arts Commission of 1847. Sixty years ago the principles of mural decoration were almost unknown in this country, and the public were enlightened for the first time about the differences between wall-paintings and ordinary easel pictures. The actual results were not as satisfactory as people expected. But in the course of the years which followed the subject was not altogether set aside, and the advance in knowledge is shown by the evidence of the artists and other witnesses before the latest committee.

The decoration of the Houses of Parliament as found at the present time can be taken as a symbol of the way in which all Government business in this country is transacted. To foreigners we are a mystery, for they cannot realise how a people who seem to be doomed to commit serious blunders in all great undertakings somehow contrive to hold the foremost place among nations. There is not one room, gallery or corridor in the Houses of Parliament which can be considered as finished. There are panels without paintings; there are niches without statues. Sir E. J. POYNTER designed two of the legendary patron saints of the country to be executed in mosaic in the central hall. The work on one cost 924*l.*, and the House of Commons was so scared at such an expenditure that the remaining patrons were never represented. J. R. HERBERT obtained a commission for decorating one of the most important rooms, and he was allowed to execute one fresco. MACLISE was entrusted with one of the longest of the galleries; it has two battle scenes in it, Waterloo and Trafalgar, but the greater part of the wall space is blank. All over the big building areas which were arranged for paintings or sculpture are vacant.

It is very easy for a critical public to blame the architect in the first place, and then the various authorities and commissions who were supposed to have the fullest freedom for carrying out decoration. The architect was blameless. The commissions were rather weak in accepting responsibility, for the members of them who were acquainted with the business of the House must have known that it was absurd to think of making the walls, as was proposed, serve the purposes of a school of British history. When members of either House attend it is not for the purpose of studying paintings or statues, or deriving inspiration for their speeches from them. They have far more important business to transact. During a session a number of outsiders, lawyers, agents, engineers, witnesses connected with private Bills are seen in committee-rooms. But even if a painting by WATTS, or CROSS, or PICKERSGILL happens to be hung on one of the walls the people are too engrossed with the evidence to pay any attention to art. For some years past the police have been very strict in preventing loitering, and a man who would stand before a statue by FOLEY or GIBSON would soon be advised to walk on. When Parliament is not sitting the public are allowed admittance during a few hours on one day in the week, and, as is usual in such places, their progress is quickened by the officials.

The inquiry before the Lords Committee suggests how little is known about the Houses of Parliament by artists. Mr. HOLMAN HUNT's knowledge is confined to the room with DYCE's pictures and MACLISE's gallery. He wanted to see HERBERT's pictures, but the room was shut up. Mr. ABBEY admitted that he was not particularly well acquainted with the building. Mr. DRAPER's intimacy was derived from one visit. Mr. T. G. JACKSON apparently also visited the buildings on one occasion. Professor LETHABY said he knew them "historically" very well. Mr. SARGENT professed to have gained his acquaintance through one visit. Mr. FRAMPTON went over it twice. It will be said that the Houses of Parliament were properly decorated, that artists as well as the general public would more often visit them. That assertion may be doubted. The buildings and exhibitions of all kinds the great public excludes the less. What the ordinary visitor is eager to see is the House of Commons, the House of Lords, and the throne of the Sovereign. He may observe the contrast between the colours of the benches in the two Houses, but we doubt whether one in a thousand would be able to describe the difference in the decoration of the House of Commons and the House of Lords.

Instead of expressing surprise at the incompleteness of the decoration the wonder is that any work of that kind was executed. It was not originally contemplated. The queer old building in which it was said to have governed the world while standing before the fire was nearly all destroyed in 1834. The Government wished to have a new building in the official style of the time, and Sir ROBERT SMIRKE received instructions to prepare the plans. But pressure was brought to bear upon Sir ROBERT PEEL, and a committee of the House of Lords decided that the style was to be Gothic Elizabethan, and that a competition for designs should be opened. CHARLES BARRY was declared the winner in February, 1836. One of the reasons given for the selection of his designs was that "from the unbroken character and general uniformity of the different front and external decorations being wholly unnecessary any of the courts, no design worthy of the country, of equal magnitude, can offer greater facilities for economy in the execution."

Then, as now, economy was supposed to excel other qualities. The building was expected to cost about 800,000*l.* and to be completed in about six years. The spirit in which the business was conducted by the Government is suggested by the circumstance that the usual ceremony was not considered necessary for starting the works, and the first stone was laid in 1840 by Mrs. BARRY.

We need not again relate the difficulties which CHARLES BARRY had to encounter in dealing with officials of various kinds who were supposed to possess greater competence than the architect. Apparently the first to suggest that the buildings could be made to subserve the arts of painting and sculpture was the PRINCE CONSORT. Under his presidency the Fine Arts Commission was appointed. Sir CHARLES EASTLAKE, the only artist connected with it, was the secretary. CHARLES BARRY was excluded. He had, however, to his own satisfaction visited Munich, where there was great enthusiasm about wall-painting, and he prepared a report which suggests that he was not incompetent to give advice about the decoration of the building. He recommended that the walls of the galleries, halls and corridors, as well as the public apartments, should be decorated with historical paintings placed in compartments of a kind which would promote an effective union between the painting and the sculpture and architecture. The paintings were to be wholly free from gloss. The plain surfaces of the walls were to be covered with suitable architectural decoration or diapered enrichment in colour, and blended with armorial bearings and heraldic insignia in the proper colours. The groined vaults were to be decorated in a similar manner, or with the occasional

addition of subjects which would not disturb the harmony or the effect of the architectonic decorations generally. The ceilings were to be ornamented in colour. He also proposed that the door jambs and fireplaces should be constructed of British marbles highly polished and relieved by gilding in the mouldings, that coloured marbles should be used in the staircases, the walls panelled in oak for eight or ten feet high, that on the panels armorial bearings should be emblazoned, that the windows should be doubly glazed to prevent the direct rays of the sun from interfering with internal decorations, that the outer glazing should be of ground glass and the inner of stained glass. That statues should be employed for dividing the paintings on the walls, that they should stand on lofty pedestals, under niches with rich canopies, and painted in such colours as would enhance the effect of the adjoining paintings. Westminster Hall was included in his scheme, and was proposed as a depository of all the trophies obtained in wars with foreign nations. Statues of British statesmen were to be introduced with others of naval and military commanders. It was also proposed to have twenty-eight paintings, each 16 feet by 10 feet, representing warlike achievements by sea and land on the walls of the ancient hall. A select committee of the Fine Arts Commission prepared a scheme which was attempted to be carried out, with the result which now can be seen by every visitor. By BARRY'S plan the Palace of Westminster would suggest the history of the country, and he hoped at the same time to raise up a school of decorative art.

There can be no doubt that the failure of the frescoes disheartened the authorities and made the public imagine that English artists were unfitted for work of that kind. Yet the endurance of the panel by Sir JOHN TENNIEL, which has remained perfect amidst seven wrecks by other artists, was enough to suggest that there is a method of employing fresco which is adapted to withstand the peculiarities of the English atmosphere. HERBERT'S *Moses bringing down the Tables of the Law* has also retained much of its original character. But as an Eastern scene bright colours, including a large amount of white in the draperies, were used, while in the other paintings the sombreness was a prelude to decay.

It is, of course, impossible to affirm that if experiments were again undertaken they would be more successful than those of which the results are visible in the Houses of Parliament. The chemistry of colours is better understood. Manufacturers are more careful than formerly. Moreover, it is practicable to produce pictures in an ordinary atelier on canvas which can be attached so firmly to walls as to appear irremovable. But there are other aids to decoration which might well be utilised at Westminster. Mosaic could be introduced for subjects which would be too highly placed for scrutiny; architectural ornament also deserves recognition, and there are places where tapestry would serve. In the old Houses of Parliament several pieces were used, but most of them had no relation to Parliamentary business. The world is now too prosaic to approve of such subjects as the Siege of Troy, Battles of Amazons, and other legendary subjects.

The committee of the House of Lords have not yet arrived at a decision concerning the methods which should be adopted for the completion of their rooms and approaches. Probably they will recommend the adoption of several varieties of decoration. But there is no use in making confusion more confounded by continuing the official practice in having two patron saints and blank spaces to suggest their companions. Those parts where a start has been made should be completed.

At the same time it would be wise to recognise that here is no necessity to give an utilitarian character to the decoration. The Fine Arts Commission wished to make the Houses expressive of great epochs in constitutional, social and ecclesiastical history. The Peers' Robing Room was to express the idea of Justice

on Earth and its development in Law and Judgment. The Painted Chamber was to suggest the acquisition of the Colonies. All that would be competition with the work of the schoolmaster. If buildings are supposed to be incomplete unless the walls are concealed with paintings, then it is right to expend money on the completion of them. But if paintings are expected to express constitutional, social and ecclesiastical history, they will require attention and therefore standing or sitting for a long time before them. There is no building in England where students of the kind would be more of an obstruction than in the rooms or corridors of the Houses of Parliament, and it deserves to be considered whether the money could not be more wisely expended in the embellishment of buildings where art would become a true teacher without any interruption of the business of the State.

TWO ENGINEERING MANUALS.*

IT is one advantage of Mr. FIDLER'S "Notes" that he has a definite idea of the class of student to whom they are addressed. There would be no difficulty in preparing a treatise on construction in steel which would require several large volumes. But when the title-page informs us that the work is intended for the use of junior draughtsmen in the architectural and engineering professions, a practitioner at once understands what is to be expected. Mr. FIDLER assumes that his junior draughtsman is grounded in the theory of construction, and can determine stresses in the structures he has to represent. But in the majority of offices the theoretical work would be performed either by the principal or a senior assistant, and the junior draughtsman's duty would consist in preparing drawings and sections to correspond with the conclusions arrived at with or without his assistance.

The preparation of drawings of steel structures must be restricted by the possibilities of constructive practice. A mason or a carpenter can cut stone or wood into a variety of forms. But in using steel we have to depend upon the sections which are found in the market or others which differ slightly from them. Much depends on custom. When Mr. FIDLER advises the junior draughtsman "that a 6-inch by 3-inch tee is by no means the same as a 3-inch by 6-inch tee," he suggests one of the numerous oversights of which contractors for steelwork complain. In fact, in many yards there is a rooted scepticism about the practical character of drawings coming from the offices of architects and engineers. Architects are also likely to fall into another error by endeavouring to obtain artistic appearance. Mr. FIDLER admits that economy of cost and painstaking in design are often obtained at the expense of appearances, and he says:—"It is to be feared, however, that any regard for appearances in structural steelwork, if it implies any increase in cost, real or imaginary, will in these competitive days be regarded by many as an economic heresy." In the pages information is given which will enable the tyro to produce drawings which will satisfy the demands of girder makers. Methods of determining the sizes of the different parts of a structure are not given. But the 400 diagrams might all have been reproduced from genuine working drawings. Although they may not have the finish of examples prepared by an engraver or lithographer they present a standard of style which could be attained by junior draughtsmen.

The examples represent lattice and plate girders, roofs, columns, struts, &c. There are also separate chapters on the structures connected with marine engineering, such as piers and jetties, piling, caissons,

* (1) *Notes on Construction in Mild Steel*. By Henry Fidler, M.I.C.E. (2) *Sanitary Engineering with respect to Water Supply and Sewage Disposal*. By Leveson Francis Vernon-Harcourt, M.A., M.I.C.E. (London: Longmans, Green & Co.)

Titan cranes, &c. Finally there is a chapter on the protection of steel surfaces. One of the early sections relates to the construction of water tanks and the girders required to support them. It is a subject which could be managed without difficulty by beginners. The following remark is worth quoting:—

In buildings of any considerable architectural importance it may be desirable to conceal the tank behind the parapet or upper portion of the walls of the main buildings. This leads to a diminution, other things being equal, of the capacity of the tank, as it is desirable to leave sufficient space between the sides of the tank and the enclosing walls for the purpose of examination, painting, or repairs. On the other hand, the tank is frequently open to view, and may be treated, as far as possible, as an architectural member of the design, although it must be confessed that the ordinary methods of embellishment are not usually remarkable for their artistic success.

A young architectural draughtsman who could devise an embellishment that would be satisfactory would earn an enviable reputation for himself. Unfortunately what is true of the tank is applicable to still larger structures in steel.

It is remarkable that in modern work evidence of the strength of steel, as of other materials, has to be derived from American rather than English experiments. Our engineers, no doubt, have tests applied, but they are generally intended for a special purpose and the results are not published. The Americans, on the contrary, appear disposed to rival the German professors in endless experiments. Mr. FIDLER's results in his chapter on columns are mainly taken from American experience, although the lessons derived from them are his own. The following piece of advice is worth the notice of beginners, especially as the virtue of proportion is supposed to be of small account in engineering offices:—

A temptation, often present to the mind of the designer when preparing his working drawings for a column or strut, prompts him to save time and trouble by only detailing, say, the cap and base to some convenient scale, and breaking off the remainder so as not to show to a true scale the entire height and length of the column or strut. This is a practice not to be commended, and one which the junior draughtsman is cautioned against, inasmuch as the opportunity is lost of viewing the true proportions of diameter or least dimension to height, a factor which is always of great importance. The complete elevation in true scale enables the trained eye of an experienced engineer to verify the theoretical conclusions he may have arrived at as to the proportions of his column, and may save him the embarrassment of the after contemplation of a work which may either look dangerously slender or unnecessarily stout.

It will be seen from the few extracts we have given that Mr. FIDLER's "Notes on Construction" is especially a book for students. It is complete within the limits adopted by the author, and should be also considered as an indispensable supplement to the more theoretical treatises on framed structures.

The scope of Professor VERNON-HARCOURT's volume is wide. Water supply including ancient examples, wells, lakes, masonry and other dams for reservoirs, purification, distribution and the no less important subject of sewage disposal require skill in condensation in order to be described in about 400 pages. It is also remarkable that from beginning to end there are no formulæ or other mathematical applications, although those relating to the problems involved in water supply are among the most interesting expressions of the science. The book is therefore adapted for others besides students of engineering, and an ordinary member of a municipal council could read every page without any chance of having a headache. It is satisfactory that so much has been accomplished in England during the past sixty years to have supplies of water in villages as well as in towns. It was a monopoly of joint-stock companies and people found difficulty in interfering with them. That they

were able to derive immense profits is suggested by the money it was necessary to pay in London in order to obtain possession of the scanty supplies and defective means of distribution. When the municipal authorities took the place of the private owners they also proved they were inspired by the desire of monopoly. Liverpool and Birmingham have offered to supply other towns at a profit because they possess sources far beyond the requirements of either city. The result is that practically London will be compelled to depend for many a year upon the Thames basin, for the remaining supplies in Wales or the Lake District are likely to be seized by more active rivals.

Some cases have occurred in recent years which have compelled many people to doubt the principles upon which masonry dams for reservoirs have been erected. The Bouzey Dam was one remarkable example, and the yielding caused an immense amount of damage. The Gros-Bois was another French case. But the number of disasters bears only a small proportion to the masonry dams which continue to work with safety. There is no more remarkable instance of that kind of construction than the dam at Assouan. It had to be not only sufficiently stable, but to allow of a discharge of 495,000 cubic feet per second through the 180 sluice-ways. It cannot, therefore, be described as continuous or solid throughout. The length of the dam is 6,400 feet, and the sluice-ways have a length of 1,181 feet, with an area of opening of 24,145 square feet. In one place excavations to the depth of 45 feet had to be undertaken. The dam is constructed of "rubble granite faced with coarse rubble masonry, laid in mortar composed of four parts of granitic sand to one part of Portland cement, except for the bottom 2½ feet and the upstream face, which were laid in two to one mortar." The cost of the work was 2,450,000*l.* But "if at any time in the future it should be determined to increase the capacity of the Assouan reservoir, in consideration of the very minor importance to Egypt of the retention of the Temple of Philæ in its present position, as compared with a great increase in the assured supply of water for the perennial irrigation of Egypt, the dam could be raised, without in the least endangering its stability sufficiently to impound the Nile waters to an increased height of 19½ feet, and thereby increase the storage to twice its present volume, at a cost of only about 250,000*l.*"

In the second part are chapters on house drainage and disposal of refuse, sewerage, outfalls and clarification of sewage, utilisation and purification of sewage on land, and chemical, electrolytic and bacterial purification of sewage. The volume is abundantly illustrated and will be of general utility in explaining principles which are essential to the public health.

ROMAN MANCHESTER.

THE date of the occupation of the Roman station of Mancunium has been treated by Professor Conway before the local branch of the Classical Association. He said that in preparing a table of the coins found on the site of Mancunium they had arrived already at a result of considerable historical importance. In the course of their inquiries a private collection of some hundred Roman coins found in Mancunium was placed in their hands. Thirty-eight of these were identified, and there were one of the Emperor Claudius, two of Emperor Nero, and there was a continuous series down until Antoninus Pius. It was the fact that the coins found formed a continuous chronological series that made the importance of the discovery. It suggested the theory that the Roman occupation of Manchester began in 60 A.D., and not 80 A.D., and thus ranked Manchester rather with Chester than with York. Why did these coins stop at the time of Antoninus Pius? It raised the question how much longer than the end of the second century did the fort of Manchester continue to be occupied as a Roman military station? If it were found that it ceased to be so after that date, then the presumption would be that the district had already become so civilised that it had ceased to be necessary to have a military fort here.

HOLYROOD CHAPEL.

THE following important letter from Lord Rosebery appears in the *Scotsman* :—

Dalmeny Park, Edinburgh :
February 2, 1907.

Sir,—I have been watching the correspondence with regard to the restoration of Holyrood Chapel, and I must confess that it has left me profoundly dissatisfied. A hope of restoration is held out to us, and then we are abruptly and curtly told that one expert has been consulted and the matter is at an end.

Now, it seems to me that this is not the way in which so important a transaction should be conducted, as there are two parties to it of supreme importance.

I do not in this connection mention the King. His consent is, of course, necessary, but I cannot believe that it would be withheld were His Majesty convinced that the restoration was practicable.

No, the two parties are these—firstly, the late Earl of Leven and his enthusiastic desire for the restoration, as expressed (among many others) to myself.

Secondly, the people of Scotland, to whom practically this money has been bequeathed for the preservation of one of her most cherished monuments. They have a right, due also to the wishes and memory of Lord Leven, to the most exhaustive inquiry into the possibilities of the matter.

Now, the trustees are honourable and competent men. But I doubt if they have entirely realised their immense responsibility to the solemn injunctions of Lord Leven and to the just rights of the people of Scotland. I will note only one instance. Lord Leven seems to have had the most absolute trust in Mr. Ross. Mr. Ross was evidently his confidant. Mr. Ross was to carry out the work. It does not seem possible that Mr. Ross, an architect of repute, should have undertaken the task of restoration, being at the same time convinced that restoration was impossible. What part, then, has Mr. Ross, Lord Leven's right-hand man, played in the recent inquiry?

Again, the people of Scotland are parties, the chief parties, to the case. I should have thought, then, that they had a right to the most public and exhaustive inquiry before their rights were set aside and their historical ruin condemned. But the people of Scotland, what do they amount to in these days? They scarcely dare whisper a wish, and they receive the inevitable refusal on their knees.

I say advisedly "their historical ruin condemned." For there are only two alternatives, restoration or destruction. And it is safe to say, at the present rate of detriment, that there are children, perhaps adults, now alive, who will be able to say—whether with pride or not I cannot predict—that they have survived the structure of Holyrood Chapel.

LIVERPOOL AND PRE-RAPHAELITISM.

ON Saturday an exhibition of paintings by Mr. Holman Hunt was opened in the Walker Art Gallery, Liverpool. The following statement addressed to the "Frequenters of the Walker Art Gallery, Liverpool," was received from the artist :—

Perhaps what I have already said elsewhere of the service which the Liverpool Academy, representing your city, in the year 1852 rendered to the pre-Raphaelite Brotherhood might seem sufficient, but I must not be deterred by fear of appearing egotistical from acknowledging the great service Liverpool rendered our body by awarding me the annual prize. After a lapse of over half a century I gratefully bear witness to the conscientious courage of the Council, which incurred contemporary odium by its championship of our efforts at art reform. Its action was represented at the time as gross and blind favouritism, but, now that the generation to which it was a vexed question has passed away, it is worth while to recall that several of the committee were local artists who gradually won deserved distinction by their own work, which in some cases had an independence of style quite distinct from that which stamped our own. Oakes is a name familiar to you all as that of a Liverpool landscape-painter of excellent character. W. L. Windus, also of Liverpool, won for himself great and continually advancing distinction throughout England by his figure-pictures. William Davis, battling with straitened circumstances, painted pictures of most poetic strain, often illustrating the lives of those vagrant actors who, in carrying their own burdens, lighten the yoke of others. I call to

mind the picture of "Punch and Judy," men and acrobats plodding with their paraphernalia and finery along rough country roads from one Midland city to another, patiently preparing to awaken mirth with sound of pan-pipe and drum. In 1852 our school was again encouraged by the award of the prize to Millais for the "Huguenots," and in the following exhibition I again received it for "Claudio and Isabella." Travel abroad delayed my making the acquaintance of our Liverpool champions, but in 1856 I visited the city, when Ford Madox Brown had been awarded the prize for his painting of "Christ washing Peter's feet."

Some of these works are now either in your Walker Art Gallery or are within the reach of the knowledge of most of you, and you can now decide whether the pictures which represented our movement and won the Liverpool Council's favour were, as our opponents represented, ignorant affections or honest endeavours to open out a fresh field for art. Millais's "Huguenots" is to be seen in the Tate Gallery, Ford Madox Brown's "Last of England" is in the Birmingham Art Gallery.

The Council of the Liverpool Academy of 1856 was a homely company presided over by Mr. John Miller—I believe they were sometimes called the "Miller and his Men." He was a merchant with an ingrained love of paintings, with which even his business office was plentifully furnished. They were stacked, face against the wall, several deep. Some of them were Academy exhibition stars of earlier days; one was a large painting by Maclise representing some Irish moonlighters of the day enrolled by a notorious "Captain Rock" of wild memory. One of the outlaws appeared pulling the trigger of a gun, whose muzzle was so directly foreshortened that each spectator wherever he stood saw himself to be the mark of the weapon. Like many other paintings of the early part of the last century, it was going to destruction in great fissures caused by contraction and expansion of asphaltum, which the artist had used in his first painting. Mr. Miller appeared to store away his pictures mainly for the pleasure of possession. On my first visit to Liverpool this kindly art patron took me to his house to meet the committee; he was a hearty septuagenarian of fresh complexion and boyish temperament, with a cheery word for everybody on the way. His home was superintended by his daughters, who seated themselves to preside over high tea. His son, Mr. Peter Miller, and the members of the Council were there to receive us. I spoke of Ford Madox Brown being present in the city, and a messenger was at once sent to invite him. They all declared themselves resigned to the storm which their predilection for the works of our school had raised up, and they complimented us upon our staunch attitude against the London phalanx of attack. Thus at once we became warm friends, and when the ladies had retired joined in smoking Mr. Miller's pungent "cavendish."

The Walker Art Gallery, representing Liverpool, has in more recent times shown its sympathy with our school by the purchase of our pictures. Millais is represented by his wonderfully precocious work of genius, "Lorenzo and Isabella;" Rossetti (who of all modern painters was best qualified by his native feeling and study fitly to interpret the poetic visions of the great trecento Florentine) is represented by "Dante's Dream;" and, lastly, my own picture of "The Triumph of the Innocents" was acquired partly by a sum voted by the Council, and partly by the contributions of the citizens, collected by the energy of Mr. Harold Rathbone. Thus the work of our school has long been familiar to you.

It might be a pertinent question to ask whether the original promise of our programme was justified by what our body has yet produced, and I must confess that the hostility of our enemies was so powerful and continuous as to become a never-ceasing obstruction to our course. I must remind you, however, that several of my paintings which would add to my toll of work are at the Taylor Buildings and at Keble College, Oxford, and are unavailable, while the life-size "Light of the World" is now at the Antipodes. Yet it is with me, as I doubt not it has been with other pre-Raphaelite painters, that many of the most cherished ideas have never been interpreted to the world, having remained but as dreams of the imagination. "The end is not yet," however; our principle was not alone for any one manner of work, nor was it in the imitation of any art, past or present. It was the opening of a door to the wide region of nature, which is without boundary either to eye or imagination; we forced the rusty hinges for the interpretation of new delights. Mulready, singled-minded enthusiast as he was, once said to me :—"One can never

stand still in art; one must go forward or one will inevitably go back." This principle is recognised not only by experienced and thoughtful artists, but by practical men of all kinds. A science investigator, physician, the religionist, the politician and the merchant will testify that this is a universal law. They will at the same time tell you that change is not necessarily advanced—it may be retrogression, degradation and corruption. Yet fresh delights are ever offering themselves to the world, crying, "Catch me who can, and make the catcher crowned."

The number of professional teachers in the present day would naturally appear to be a gain to art, but I, feeling somewhat as an aide-de-camp charged from his general to a battalion with a message on which the fortunes of a hard-fought battle depend, must not (when so many of my compeers have already fallen) shirk my responsibility by leaving unsaid the truth; and it is this, that the increase of camp-followers has its great danger from the fact that now many come into the field who are not chosen by nature herself for the struggle.

Michel Angelo used the chisel when he was a mere child. Many now as adults enter the lists, and finding much hard study and practice are required of them, having no heart for such service, take a short and royal road to eminence by proclaiming themselves impressionists, adopting reckless handling and purpose as signs of masterliness, and, together with others in the same straits, they deafen the world with cries of "We will have no more study, no more design in art, no more high thought, no care for noble selection of form, no harmonious chords of colour, no worry over perspective and foreshortening, for now the happy reign of uninstructed genius has come to be worshipped in the light of modernity." Whether or not the affectation of reckless execution and indifference to selection will, in the end, destroy English art (quite a possible prospect) it is certain that true art, on whatever soil, will have none of such paradoxes. The common sense of mankind will do without art if it is to be rude and ugly. There is no doubt that some work appearing in fellowship with that of the wildest impressionism displays honesty of effort and desire which should save it from classification with the work I have already described, but such merit arises from the recognition by its authors, that the quality characterised as impressionist is but one of the many which art demands, and this makes him understand that one quality alone cannot be so paramount as to overwhelm all others.

But beyond the question of mere manipulative skill we must consider the spirit by which pure English imagination has ever been guided since first our countrymen wooed poetic fancy to their service, leaving example to formative artists which they in turn have faithfully followed:—

Muse of my native land! loftiest Muse!

Oh Thou hast won

A full accomplishment! The thing is done,
Which undone, these our latter days had risen
On barren souls.

When not diverted by foreign influence the British notion of the purpose of art has ever been to consolidate principles of honour and purity and whatever tends to the innocent peace and stability of character of the people. It has done this by dwelling upon the rich bounty of creation, the glory of heroism, the sweetness of unaffected goodness and the misery attending betrayal of trust.

Whether England, built up as she has been by a succession of heroes, poets and teachers to a position of power, benevolence and justice, shall survive the rude shocks of party rancour and strife to which she is exposed in our days, or whether, like Spain, she shall be again reduced to the limits of a mere province, she will leave behind her a noble record of national aspiration. Whether our empire shall continue or decay, among the testimonies that will survive will be the works of our English artists, who in architecture, sculpture, painting and decoration have proved that they have been moved by the same original genius which had made England so noble in other domains.

The Manchester Art Gallery Committee have resolved to hold an exhibition in the Queen's Park Art Museum in the spring, to consist of oil-paintings, water-colour drawings and casts belonging to the committee, and, if possible, the works contained in the "Childhood" Exhibition now being held at the Baillie Gallery in London.

GUSTAVO GIOVANNONI AND CURVES IN PLAN IN THE TEMPLE AT CORI.*

By WILLIAM A. GOODYEAR.

THE object of this paper is to call attention to the recent remarkable observations of curvilinear refinements in the temple at Cori. Professor Gustavo Giovannoni, who has made these observations, is assistant professor in the Royal School of Engineering Architects at Rome, and at present holds the office of vice-president in the Roman Society of Architects (Associazione Artistica fra i Cultori di Architettura, Roma). Aside from other publications, he is the author of an important monograph on the building popularly known as the Temple of Minerva Medica at Rome, designated by Professor Giovannoni as the "Sala Termale della Villa Liciniana."

The attainments as an architectural surveyor and as an engineering expert and expert in construction which are implied in Professor Giovannoni's position as instructor in the Royal School of Engineers at Rome are additionally guaranteed by the technical precision of his monograph on the "Sala Termale della Villa Liciniana." The revolutionary importance of the observation to be described makes it more than usually necessary to mention the attainments, standing and expert character which are thus guaranteed in the observer. For in giving credence to the observations at Cori we are entering on unexplored territory, we are necessarily abandoning frequently-quoted and widely credited explanations of the ancient curvilinear refinements in favour of other explanations which have been widely ignored. More than that, we are facing phenomena which must appear almost incredible to the every-day current knowledge of ancient art.

Hence an unusually circumspect and careful consideration of all the facts is to be desired. To this end we shall, first, briefly describe the observation of Professor Giovannoni. Second, we shall explain in what sense it is novel and remarkable. Third, we shall rehearse the previously more or less well-known facts about the ancient curves, and consider what special theories relating to them must be abandoned and thrown out of court in face of the newly-discovered curves at Cori.

The announcement regarding these curves was originally made by Professor Giovannoni before a meeting of the Roman Society of Architects which was held on February 6, 1905. It was first published in the "Annuario" of the Society for that year. The additional facts to be related were then obtained through personal correspondence with Professor Giovannoni, who has also allowed me to describe and publish them.

I am advised by his letter of December 8, 1906, that the isolation of the temple at Cori from adjacent buildings will be shortly undertaken by the Italian Government, and that this opportunity will be used for the construction of scaffolds which will enable him to take measurements in detail of the upper portions of the façade. Meantime I quote from an earlier letter of July 2, 1906, the following information:—

"The Temple of Hercules at Cori belongs to the late epoch of the Roman Republic, and is one of the finest specimens of this period of transition from the Greco-Etruscan style to the Roman. The pronaos and the great door are still in almost perfect preservation, and show splendid execution, both from the artistic and from the constructive point of view. The suspicion of accident (in regard to the curves) cannot be entertained. No one, however, as far as I am aware, has previously observed or measured the curve of the façade. This curve exists notwithstanding, and is very clearly defined. The concavity (in plan), which is small at the columnar bases, where it measures 10 or 12 cm. deflection, increases to nearly 35 cm. in a length of m. 7.50 at the cornice. The gable follows the same line, and the regularity of the joints give assurance that neither (original) accident nor subsequent movements have produced this remarkable deflection. There are no curves on the flanks."

As regards the measurements just quoted, it is to be observed that the curve of 10-12 cm. quoted for the base is one of unusually large deflection for the given length of m. 7.50, as compared with other Classic curves, and that the curve at the cornice of 14 inches, or 35 cm., is far greater than any curve previously recorded for the ancient monuments, both as regards the actual measurement and sti-

* A paper read before the Archaeological Institute of America at Washington, January 2.

more as regards the relation of other smaller deflections to the greater widths or greater lengths of buildings.

Aside from the remarkable account of the curve, its still more remarkable feature is the concavity in plan, and I need hardly remark that this feature constitutes its most astounding and novel characteristic. It is further to be noticed that no other Roman temple has been so far announced as showing any curves whatever, with the exception of the Maison Carrée at Nîmes, which has curves in the cornices of the flanks which are convex to the exterior.*

Aside from the assurances given by Professor Giovannoni as to constructive intention, there are two evidences of such intention which speak for themselves, even to those who have not examined the temple, viz. that the curve is found in the bases of the columns, and that a concave curved deflection in plan of the cornice and gable, to the extent of 14 inches, could not have been the result of accidental movements without the appearance of very visible and palpable dislocations in the connected structure, which must also have visibly affected the supporting columns either at the angles or near the centre, one or both.

As regards the theories which have been advanced to explain the ancient curves, the discovery of curves at Cori, concave in plan to the exterior, has a revolutionary and far-reaching significance. The optical effect above the level of the eye of a curve concave in plan is that of a curve in elevation (that is, of a curve in a vertical plane) which descends towards the centre. Consequently the explanation, which has been so widely quoted and credited, that the ancient curves were intended to correct optical effects of sagging downward, is immediately and decisively thrown out of court in the case of the temple at Cori as far as that temple is concerned, for it is exactly an effect of sagging downward which is actually produced by this curve, as far as the upper horizontal lines are concerned.

So conclusive an argument leads us to examine the previous standing of the widely-spread impression that the Greek curvilinear refinements were intended universally to correct optical effects of sagging and thus cause the lines to appear straight. This explanation is frequently quoted for the rising curves in elevation, such as are found in the Parthenon and some other Greek temples; and these are the curves which have so far generally absorbed the attention of the majority of experts. It is true that different curves may have been employed in different ancient buildings for different reasons. It would be establishing a very important fact if this fact alone were established by the instance at Cori, but the opportunity is a convenient one to point out that the widely quoted explanation is essentially a popular misapprehension of an entirely different proposition, and that this widely quoted explanation has never been mentioned by any of the optical experts who have written special publications on the Greek curves.

It is a popular modern prejudice that architectural lines ought to be straight. It is consequently a proposition which instantly appeals to the popular mind that the Greeks curved their architectural lines in order that they might appear straight. Hence probably the widely-quoted but really mistaken proposition that all horizontal architectural lines tend to sag optically at the centre. This impression among architects may be due to the occasional practice of cambering interior flat ceilings or tie beams under a gabled roof, but the problem of optical effects in such interiors has no relation to the general, but mistaken, proposition.

It is an elementary proposition in perspective that horizontal lines above the level of the eye, on near approach, curve downward toward the extremities. This elementary proposition is most easily realised by assuming the position of the spectator to be opposite the centre of a building, of such dimensions that the head has to be turned first in one direction and then in the other in order to take in the entire upper line. As the really horizontal upper line to the left of the spectator will descend optically in perspective towards the left, and as the really horizontal upper line to the right of the spectator will descend optically towards the right, it is manifest that the eye in passing from left to right, or from right to left, must see the whole horizontal line optically as a curve descending towards the extremities and highest in the middle. It is equally true that all lines

which descend in perspective in a single direction must descend in a curve, optically speaking, because the line, which is really straight and horizontal, descends in gradually increasing amount according to the distance from the eye. Consequently, an actually horizontal straight line which, optically speaking, changes direction from point to point, must necessarily change direction, optically speaking, in a curve. It is only the mental knowledge that the line is really straight and horizontal which interferes with the perception that the line is really seen as a curve.

The interference of a mental conviction, based on general positive knowledge, with an actual optical appearance is a well-established fact. This interference of the brain with the true facts of vision has been ably described by Professor Guido Hauck in a publication to be presently quoted. Professor Hauck found that the ability to see the rising curves which optically exist in all horizontal lines above the level of the eye (unless interfered with by other lines) was strongest in women and in the persons whom he calls "Naturmenschen," among whom he includes artists; whereas persons with mathematical and scientific training were frequently unable to see the curves at all. He also found in his own experience a progressive improvement in his ability to distinguish the curves as actually seen by the eye. He also found that optical curves in lines really straight and horizontal could be seen in a line of separated lights illuminating an architectural line at night, when they could not be seen in the same architectural line by daylight. The mental conviction had an effect on the continuous line which did not occur with separated points of artificial light not visibly connected by the architectural line.

(To be continued.)

LIVERPOOL ARCHITECTURAL SOCIETY.

ON Monday last the President, Mr. Edmund Kirby, presided at the fifth sessional meeting of the Liverpool Architectural Society, when a paper, illustrated with plans and elevations from many sources, was read by Mr. Geoffrey Lucas on "Inexpensive Cottages." The lecturer rejoiced at the modern practice of retaining an architect to erect cottages, rather than to leave the work wholly to the builder, and remarked that a cottage surrounded by a garden and out of the dust of motor-cars should make a pleasant residence. Good models might be found among the old cottages in rural districts. The question of inexpensive cottages obtained additional force because of the national movement represented by the cry of "Back to the land," which improvements in transit, telegraphs, telephones and garden-city schemes were rendering practicable. Indeed, the first experiment in garden-city building promised to be successful. The most important feature in a cottage was a living room of good size, with the entrance shielded from draughts, a comfortable fireside, and a wide window, having a sunny aspect and a high sill. He pointed out that single or semi-detached cottages meant a sacrifice of dignity in the building scheme, and gave a village or town a straggling look, as at Letchworth in its present stage. The public were taking a rapidly increasing interest in architecture, and he need not impress on such an audience the importance of good architecture on the solution of the housing problem. Discussion and thanks followed, the lecturer accepting an invitation to visit Port Sunlight.

The Town Clerk of Coventry has issued a notice that the City Council intend on February 26 to apply to the Local Government Board for their approval to the appropriation of lands in Earl Street for municipal buildings, and to the borrowing of 30,000*l.* for that purpose. The memorial which is to be sent to the Local Government Board points out that the Council do not at present possess municipal buildings other than an ancient guildhall, and it is proposed to erect municipal buildings for the purpose of providing the necessary accommodation for their officers and servants. Following other details the memorial sets forth that, as such accommodation could be provided on the upper floors of the said municipal buildings, it is proposed to appropriate so much of the ground floor of the proposed new building as fronts to Earl Street for the purposes of shops to be let to tenants. When the Local Government Board inquiry is held into the City Council's application for borrowing powers of 30,000*l.*, it is understood very strong opposition will be forthcoming to the application.

* The constructive existence of these curves has been verified by the official architect of the city of Nîmes, and also by his predecessor in the same position. See Smithsonian Reports for 1894 (published in 1896), "A Discovery of Horizontal Curves in Plan in the Maison Carrée at Nîmes." Under the same title see also the *American Journal of Archaeology*, vol. x. No. 1 (1895), and the *Architectural Record*, vol. iv. No. 4 (1895).

NOTES AND COMMENTS.

THE Stockport waterworks litigation has taken so long to investigate there are some grounds for the rumour that the costs will amount to over 20,000*l.* The claim was made by Mr. HENRY KELLETT, the contractor. There was so much detail that the case was left to Mr. MUIR MACKENZIE, the Official Referee. In May 1903 Mr. KELLETT entered into a contract with the Corporation, amounting to 248,724*l.* 15*s.* 3*d.*, for the construction of a dam in the Kinder Valley. There was some difficulty in making the dam watertight, and it was necessary to cut a deep central tongued trench and to widen the foundations. There were stoppages, but ultimately the works were suspended. Mr. MANSERGH, the engineer, informed the Corporation that the contractor had not sufficient plant to carry out the work as rapidly and efficiently as was required. Evidence was given that the foundations as specified were inadequate to bear the weight of a masonry dam. The case for the Corporation was that there was no warranty on their part that the work could be carried out, and that it was for the contractor to satisfy himself about its feasibility. If the scheme had been carried out and the dam given way, there would have been fearful destruction of life and property in the Kinder Valley. The resident engineer admitted that he thought the contractor was only bluffing when he proposed to have the foundations deepened, although he was aware of the compressibility of the strata. The contractor claimed the balance of the retention money and interest; secondly, the price of the work done since the last certificate was given, but for which no certificate had been given because the contract had been terminated; thirdly, damages for delays in the work in 1904-5-6; and finally, compensation for profits which he had been prevented from earning. The Official Referee decided on the first point that the money should be paid. He valued the tongue trench at 8,610*l.*; he valued the uncertified balance at 5,475*l.* 4*s.* 11*d.* For delays due to the Corporation the sum of 3,696*l.* 4*s.* 6*d.* was awarded. The Referee considered that the value of the work which was not executed under the contract amounted to 328,100*l.*, and, allowing for contingencies, he valued the profit on that amount at 29,400*l.*; altogether the total amount came to 52,546*l.* 19*s.* 1*d.*, and the plaintiff was also awarded costs on the hearings at Manchester and in London. Although Mr. KELLETT has not obtained the total amount claimed, he has received compensation, and his action in declining responsibility for the safety of the dam as specified has been fully justified.

A FEW months ago we called attention to the efforts of the masons in Birmingham to have stone dressed in the city instead of at the quarries. Another attempt was made in the Council of that city to have all the stone required in the extension of the municipal buildings dressed in Birmingham or in an adjoining district. The tenders for that work are yet to be sought, and it is more fair to contractors to inform them beforehand about requirements than to have demands sprung upon them at a later time when other arrangements have been entered into. It is, no doubt, very hard that Birmingham masons should be deprived of a class of work which at one time they could claim as a right. But everywhere and in all kinds of business there is a search for cheapness, and by the use of machinery at the quarries stone can be delivered in Birmingham much cheaper than if all the work had to be performed within the city. If the people of Birmingham prefer to employ local labour all that is necessary is to resolve on paying a higher price for their buildings. If a contractor agreed to perform the work at a low rate and in consequence became a bankrupt, he would find little sympathy from his creditors. There was some truth in Mr. TONKS's remarks at the Council meeting when he said that stone worked under the supervision of a clerk

of works was likely to wear better than stone worked by machinery at quarries. But it is the Council who should act in accordance with that opinion and not the contractor. As there were thirty-five members in favour of the quarry system and thirty in favour of hand working, economy won the day.

ILLUSTRATIONS.

THE MANCHESTER WHITWORTH INSTITUTE, WHITWORTH PARK.

THE illustration shows the façade of the Whitworth Art Gallery as it will appear. The new façade will be built of thin red bricks and terra-cotta to correspond with the present galleries. The entrance hall will be only one storey in height, with a flat roof, so as to admit the light freely to the sculpture hall, which will be behind it. The two bays (over the staircases) will be carried up as square towers, breaking the long line of the façade.

Inside the porch there will be a large vestibule leading into an entrance hall 33 feet 4 inches by 33 feet 4 inches, the ceiling of which will be divided into panels by beams carried on polished grey granite columns, and in the large square central panel will be a glass dome to light the hall. On each side of the hall will be cloak-rooms. A wide doorway from the entrance hall will give access to a sculpture-hall 102 feet 6 inches by 33 feet by 20 feet, high-lighted from high windows along each side of the whole length; the two end walls are arcaded with three arches carried on polished granite columns, giving access to the present north and south galleries and to two staircases leading to the upper floors; beyond the staircase hall at each end is a square pavilion 33 feet by 33 feet, the one to the south on the ground floor to be used for official rooms and the one to the north for exhibition purposes. From the sculpture-hall in a line central with the front entrance a wide doorway will lead into a corridor, giving access to the present central gallery, and on each side of this corridor will be a top-lighted gallery for exhibition of textiles, &c. The galleries are so planned that a clear view will be obtained from the front entrance, through the entrance hall, sculpture gallery, corridor and central gallery, to the extreme end of the new western galleries, a total length of 244 feet. The upper floor will contain library, council chamber and exhibition rooms. Each of the two staircases gives access to the basement, which will contain, in addition to the present galleries, rooms for the staff, a large strong-room and storage for chairs, &c., and a connecting corridor between the north and south basement galleries. The architects are Messrs. J. W. BEAUMONT & Son, of Manchester.

MEMORIAL CHAPEL, CONVENT OF ST. MARY OF NAZARETH, EDGWARE.

THIS chapel has been built as an addition to the cloister, with which it is in communication through the arch of the centre bay of the east walk. It is intended as a memorial to the late Rev. Mother MONNICA, whose grave is seen in the foreground of the photograph, and who is commemorated in a short Latin inscription cut in a panel on the east side of the retable. The convent buildings, of which the cloister forms a part, were designed by the late Mr. JAMES BROOKS, and the present work has been carried out by his successor, Mr. J. STANDEN ADKINS (JAS. BROOKS, SON & ADKINS). The contractor for the work was Mr. PARMENTER, of Braintree. The carving has been executed by Mr. F. A. WYNNE, of Balham, and the copper roof and cross by Messrs. EWART & SON. The photograph is by Mr. CYRIL ELLIS.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. T. E. Colcutt, president, in the chair.

Royal Gold Medallist.

The PRESIDENT said it was his pleasure to announce the name of the architect the Council proposed to submit to His Majesty as a fit recipient of the Royal Gold Medal. The President was sure that the meeting, and indeed the whole profession, would feel with the Council that the architect they had chosen was the one most worthy of receiving the high honour; he was Mr. John Belcher, A.R.A. The President said he felt that Mr. Belcher was an architect who had revived and continued in his work the best traditions of the English Renaissance. The President did not propose to say much on that occasion concerning Mr. Belcher, but he believed the entire profession would receive with acclamation the choice of the Council.

Address to Students.

The PRESIDENT said:

We are assembled here to-night for one of the most pleasant functions of the session, that is, the presentation of prizes to those students who have been fortunate in their endeavours, and whose work has obtained deserved recognition. In their success we are all deeply interested, and in offering them our congratulations I feel sure we shall have the hearty support of those students who, for the moment, have failed to reach the goal, but who, nevertheless, we are confident have not lost heart.

It has been well said, "In the vocabulary of youth there should be no such word as fail." This is the spirit which should inspire the student, which should bear him up against temporary defeat, and should brace his energies to re-enter the lists with courage. And after all, those who are unsuccessful may console themselves by the reflection that "the race is not always to the swift, nor the battle to the strong."

We shall presently have the pleasure of listening to some critical remarks by Mr. A. W. S. Cross on the work that has been exhibited in competition for prizes. In the meantime I propose to adhere to the time-honoured custom in taking this opportunity of addressing a few words to you in the way of advice and encouragement. In following the excellent example of my predecessors, I must of necessity travel over ground with which some of you are already familiar; but having had a long experience I hope I may be able to offer you some serviceable advice.

In the first place, I wish to impress upon you the importance of fully considering whether the career you have chosen is your proper vocation. It is essential to be sure that you have not a mere inclination for your art, but that you feel for it such a love and reverence as will enable you to overcome serious difficulties. If after a period of work in the schools you find that your interest is not sustained, and that your labour becomes irksome, then I would advise you to consider seriously whether some other career would not offer more attraction and interest to you. Nevertheless, do not be easily discouraged. Remember that in all callings, even in the highest, there is a certain amount of drudgery and uninteresting work to be faced before one is qualified for the more pleasant studies which follow.

But perhaps these words of warning are not necessary. Let us hope that all whom we see here to-night are entering upon their career with enthusiasm, and with the feeling that they are serious students of the oldest of the arts—an art in which one always remains a student, and in the practice of which a lasting joy is to be found. Most of you are familiar with the educational work carried on at Grafton Street and with the advantages derived from attending the classes held there. The school is still in its infancy, and we have every reason to hope it will continue to develop in the right direction. My private experience of the high qualifications of those students and assistants with whose work I am familiar fully corroborates this encouraging view.

It is not within the province of such an address as this to dictate the course of study you should pursue. This has already been efficiently done by the Architectural School and by the Board of Architectural Education. However, I may remark that naturally among your first attempts will

be geometrical drawing, freehand, drawing from the round and perspective drawing. A student cannot pay too much attention to the acquirement of draughtsmanship so necessary to our art. In particular I would advise that perspective be very thoroughly learnt, and that in practising it at first only rigid lines should be employed, all picturesque, broken and shaky lines and "dodgy" lights and shadows must be regarded as pitfalls and must be avoided. I would urge you to do all in your power to become perfect in this branch of your studies. To design well is to think in perspective; to be able to think in perspective one must have a sound knowledge of its principles. Again, I would advise constant practice in sketching from still life; a quarter of an hour each day will be of immense benefit.

Always remember this: all your skill and accomplishment as draughtsmen, whether merely in geometrical or perspective work, or in the artistic representation of sculpture and carving, are only a means to an end. Do not forget that much of the great work of the world has been achieved without the aid of drawing; that is to say, without that quality of drawing which in the present day we are obliged to consider an essential to the complete education of the architect; for example, the drawings that we suppose to have been executed by Wren, will not bear comparison with the work that we ordinarily expect from an advanced student. The geometrical work of Wren was no doubt correct, but, according to the standards of the present time, it was certainly ill-drawn. Although there is evidence that he could very clearly indicate the carving he thought desirable, yet these indications would scarcely pass muster as really good drawings. I do not lay stress on this point as an excuse for slovenly and bad drawing. Good draughtsmanship is, as I say, necessary nowadays; but I wish to warn you emphatically against the temptation of thinking that pretty drawings are essential to good architecture.

I recently saw some modern buildings in Spain designed in a rococo manner, with a touch of L'Art Nouveau. Well, we have some pretty bad art even in England; but I think that this surpassed the utmost I have seen in the way of banality, feebleness, vulgarity and originality—save the word. I learned that this was the work of a man who had gained a Government diploma as a qualified architect; that he was a most accomplished draughtsman, and that the drawings of the elevations of these very buildings almost amounted to a work of art. I think this may be regarded as a lesson in considering drawing only as means to an end.

There is an old saying that "you cannot make a silken purse of a sow's ear," and you cannot make a fine building merely by means of fine drawing; you may embroider the sow's ear with the finest silk, but it remains a sow's ear.

In studying the ancient, the Mediæval and the later styles of architecture, I would advise separate study of each period as far as possible. Make a thorough study of the Greek, the Byzantine and following styles, taking as examples some well-recognised buildings, but bearing in mind that no buildings can be fully appreciated from mere illustrations, however well executed these may be. To gain even an approximate idea of what inspired the ancients and our more immediate forefathers, you must see for yourselves the monuments they have left for our wonder and admiration.

I may mention here my own experience in this direction. Although I was fairly familiar with the Doric Order as exemplified in the Parthenon, yet it was not until I had actually seen the building that I was able fully to appreciate and understand the wonder of this work, to my mind the simplest as it is the most beautiful of all the Greek masterpieces.

Although from books and drawings one may be perfectly familiar with the general lines and proportions of the Parthenon, yet one does not fully appreciate or understand the wonder of the work unless one has seen the actual building. When one contemplates it, even in its present condition, dominating the Acropolis, under the southern blue of Greece, it needs but little imagination to conceive something of its magnificence as it shone in all its glory twenty-four centuries ago. The more one sees of the Parthenon the more one is impressed with its marvellous purity of line, workmanship and material. It expresses in a wonderful measure the thought, religion and learning of the period during which it was built, and it reaches the highest ideal and the perfection of architecture and sculpture. I am not advocating the Doric as a style suitable for to-day, neither do I maintain that it would adequately

express the mind, religion and history of the periods succeeding the Greek. It does not appeal to modern requirements, ethics and social life in the same sympathetic manner as the Byzantine and the succeeding styles.

The Parthenon seems to me to embody perfection of line. The entasis of its component parts, the columns and the steps are perfect, and one feels that even such details as the curve and width of the flutings could not be altered by the fraction of an inch without damaging the proportions. The very dimensions of the building could not be altered without detriment. Perfection having been attained in the dimensions, the building would not have been so perfect had it been smaller or larger.

A lady of the inquiring type of mind once asked (not as a riddle, but as a serious question), "Why cannot architects improve on the design of a building erected so many centuries ago?" "Madam," was the reply, "has the Almighty improved on Adam and Eve?"

I am not advising you to study Greek work so that you may erect Greek buildings in England, but so that you may attain some notion of the motives and ethics that influenced Greek architects and sculptors—to fully comprehend these it would be necessary to have considerable knowledge of Greek literature, religion and daily life. It is very questionable whether Greek architecture is suitable to our climate and to the conditions of modern life and thought. In our country it tends to become "faultily faultless, icily regular, splendidly null." Think of the Parthenon with its colour, its workmanship and its setting of blue sky and clear atmosphere, and then look at the Doric portico to Euston Square station. Neither its material, its colour, nor its size is satisfactory. With regard to material the stone employed is not sufficiently delicate in colour or in texture to obtain the true proportion of light and shade, especially to the flutings. The diameter of the columns, and therefore the whole structure, is greatly in excess of any known ancient examples; and one cannot but believe the Greeks had determined the limit of magnitude for work in this Order.

I am afraid I am enlarging my discourse into a lecture, but I wish to impress upon you the necessity of acquiring a sense of proportion, and the only way to do this is to approach in a spirit of reverence the great works that have appealed to successive generations, and that are universally acknowledged to be masterpieces. Do not, at any rate to begin with, criticise too freely the works of art that have been established as pre-eminent by the verdict of expert opinion in ages past and present. Take this verdict for granted, and then study these great works by drawing and by contemplation, and try to understand wherein lies the excellence of their proportion, of their detail, and of their general massing.

I do not consider it advisable in pursuing these studies to exclude a study of the modern building from your curriculum; however enthusiastic in your admiration for one style or period, do not blindly condemn all others.

In giving your attention to the old masterpieces, do not omit to observe very carefully the materials in which they are built, for this is of the utmost importance. The student should not only make himself thoroughly familiar with the right use of materials, but he should be sure to realise the great influence that these have upon style. He should also compare the varying qualities of workmanship. Ruskin, I think, has somewhere made the assertion that perfection is not always desirable. An illustration of this theory may be found in comparing the perfection of the Greek Doric workmanship with the roughness and unevenness of the porphyry and other columns in Sta Sophia at Constantinople. In the latter case, perfection, I think, would have been fatal; the very unevenness of the surface of the columns gives additional charm. I will venture to uphold the theory that excellence of workmanship as regards exterior finish is altogether desirable for any architecture founded on the Classic, but that very high finish is not always desirable in Byzantine and Mediæval work. In most old examples it is not met with.

Let me counsel you, when you have made some progress in the study of a particular style, to practise design in that style; but I must warn you to avoid efforts after originality. A strong personality will inevitably assert itself sooner or later, but pray do not force it. There is nothing new under the sun, and it may safely be said of any too "original" kind of building that it has been done as badly before. I have warned you against the "New Art;" this, however, I do not utterly condemn, because I think it has occasionally shown some signs of merit; but a previous and acknow-

ledged style is generally found on careful scrutiny to be the basis of these signs of merit, the origin of "originality." Do not attempt the new art until you have a knowledge of the old. In your education as architects I think you will find plenty to do without striving to impress the public with your originality. In practising designing do not lose heart; this branch of your studies requires as much patience and perseverance, perhaps more, than any other. Do not hesitate to use india-rubber; never mind the soiling of paper—perhaps you will find the dirtier your paper becomes the nearer you are to achieving your aims. All may acquire an ability to give the world something pleasing although it does not come within the scope of all to leave a lasting mark on the history of their generation.

To turn to more prosaic matters, a somewhat homely comparison may be used to illustrate the diverse nature of acquirements necessary to an architect. A second-hand furniture dealer in a back street advertises the magnitude of his undertakings in quite a forcible manner. Over the doorway of his sordid-looking shop is written—

Do you want it? We sell it!
Don't you want it? We buy it!
From a microbe to an air-ship.

Well, this gentleman's business would seem to cover good deal of ground; perhaps his advertisement errs on the side of exaggeration. But some of the same words might very appropriately be applied to our calling. It is expected that your education should include a knowledge of almost every possible trade. You must necessarily be acquainted with the habits of the microbe, the mysterious tenant of the sewer; and possibly you must also be acquainted with the suitable decoration for a steamship saloon. You must certainly understand something of all the building trades involved in erecting anything from a cottage to a palace. It really appears, therefore, that your education must be as wide as the business operations of the man who will deal in anything from a microbe to an airship. But do not be discouraged. As you progress you will find that this diversity of subjects is not so formidable as at first appears. It is true that besides the fine art of architecture and the art of construction, there are many subjects with which the architect must have more than a casual acquaintance. Although experts may be consulted on steel construction, sanitary work, electrical work and heating, yet the young architect should endeavour to become master of the principles involved in such matters as these. It is also very important for the student to have some knowledge of the sister arts of painting and sculpture and under proper guidance to study the old masters. He should know something of the history of painting, and should be able to trace the gradual development of colour-decoration from early work, such as the Byzantine mosaics, to the culminating point of colour-decoration as exemplified in the pictures of the Italian Renaissance. Let him also study sculpture; in our museums he will be able to compare the Ninevehite and Egyptian work with the Etruscan marbles, and from them he will pass to a study of the Italian work. Neither must the lesser arts be neglected. Furniture, porcelain, needlework, tapestry, in fact, every department of the fine arts, should be considered. The collections at South Kensington Museum should be studied and compared with the architecture of the same date. Chippendale and Sheraton, Jacobean and Carolian furniture should be observed in reference to the houses of the periods in which they were designed to adorn.

In conclusion, let me repeat how great has been my pleasure in addressing you to-night. You are starting on your careers; I may be considered as having entered on the last stage of mine. I can conscientiously assure you that I still feel as great a devotion as ever to the art I practise, although age is generally supposed to dull enthusiasm and to give rise to a prosaic and worldly spirit. Happily our art always tends to maintain youthful thought. With all its difficulties it has this great compensation—that to the last we can take a joy in our work and a pleasure in striving to arrive at that ideal in art so ably described by George Gissing:—"Art might be defined as an expressive, satisfying and abiding, of the zest of life. This is applicable to every form of art devised by man; for in his creative moment, whether he produces a great drama or carves a piece of foliage in wood, the artist is moved and inspired by supreme enjoyment of some aspect of the world about him—an enjoyment in itself keener than that experienced by another man, and intensified and prolonged by the power which comes to him, we know not how, of recording in visible or audible form that emotion of rare vitality."

Mr. A. W. S. CROSS read the following

Review of the Works Submitted for the Prizes and Studentships, 1907.

Before proceeding to discuss, in accordance with the pleasant but responsible duty entrusted to me, the comparative merits of the various essays, designs and drawings submitted this year in competition for the prizes and studentships of our Institute, I propose, with your permission, to make a few general remarks upon the quality of the work I have lately examined.

In the first place, it is somewhat disappointing to the Council to have to record the lamentable fact that, with one or two exceptions, the work received falls below the standard of excellence attained in recent years, at least as regards the designs and drawings, for, as I have not had the pleasure of reading any of the essays submitted on other occasions, I am unable to state whether the two which have received recognition in the recent essay medal competition are above or below the average standard of merit of those of former years. However this may be, the best of the essays of the year, without perhaps possessing that somewhat mysterious and oft-quoted quality known as "literary style," are both eminently readable, interesting and instructive productions, which deserve the honourable positions they have obtained. Whilst it would be invidious and altogether unnecessary to point out glaring weaknesses in any particular design, it is quite obvious than many of the competitors for the Soane Medallion have paid very little attention to the elements of scientific planning. To those students I would reiterate the well-known fact that the ideal plan is one which is apparently of the simplest possible character, and indeed is so easily read and understood that its dominant idea can be immediately grasped even by an inexperienced observer who would, not unnaturally, imagine that it had been evolved after perhaps an hour or two's work. Now the unnecessarily complex nature of the planning observable in many of the designs is very noticeable, and their authors would be well advised to be mindful of the old saying, "Summa ars est celare artem," and in their future efforts endeavour to conceal, by the production of simple and apparently easily arrived at plans, the vast amount of study and labour involved in the solution of problems in planning arising from the multitudinous requirements of large buildings.

With regard to the architectural quality of the work submitted, I would plead for more accurate scholarship; and although, of course, our students are in no way to blame for the wholly inadequate existing arrangements made for their technical education and training, yet in an address that is primarily delivered to students, I trust I may be permitted to express the hope that the time is not far distant when the younger members of our profession will be enabled, by the institution throughout the country of a well-devised, systematic and co-ordinated curriculum of study, to produce designs of a far more scholarly type than those emanating from the majority of the architects of to-day. Zeal without knowledge is like expedition to a man in the dark, and in support of my plea I may mention the fact that, in some of the designs (and even in a measured drawing of what is supposed to represent a well-known building by an eminent architect of the eighteenth century), the authors have not taken the slightest trouble to correctly delineate the proportions and characteristics of the Classic orders with which the building and designs in question are embellished. Students should remember that the immediate future welfare of our art is in their hands, and endeavour to recognise the undoubted fact that skill in draughtsmanship, when not allied to architectural scholarship, does not admit of the production of good architecture. Although I have ventured to express the opinion that the drawings and designs generally are inferior to those of recent years, yet I must certainly make an exception in the case of Mr. Jackson's work for the Owen Jones Studentship, the quality of which is of so high an order of merit as to be quite beyond reproach, while the drawings submitted by Mr. Robertson for the Measured Drawings prize are also exceptionally good. With these few preliminary remarks I will now discuss the individual efforts of the various competitors.

The Essay Medal.

Six essays on "The Influence of the Use of Iron and Steel on Modern Architectural Design" were received, and the medal has been awarded to the one submitted under the motto "Three Ages," while a certificate of honourable mention has been given to Mr. Verstage, of Godalming, whose essay was placed second in order of merit.

The author of the successful essay treats his subject in a very practical if, necessarily, in a somewhat concise manner, and after a brief but interesting historical introduction there are some valuable notes on the use and properties of cast-iron, wherein mention is incidentally made of the widespread attention drawn to iron construction by the erection in 1851 of the Crystal Palace. The present use of steel as applied to the structure of buildings, its effect on planning, its economy of space and its influence on fenestration and design are discussed at some length, and diagrams are appended showing the comparative sizes of brick piers and steel stanchions necessary for the support of edifices respectively twenty and six storeys in height.

In conclusion, the author is of opinion that while the use of steel is, for the moment, an economical necessity, it does not necessarily follow that this form of construction, with its many unstable qualities, will be in vogue as a system of building for any very considerable time, or that it is likely to take permanent root in this country, and that in all probability the use of structural steel is but a passing phase.

The question is discussed at greater length by Mr. Verstage in his essay, which is copiously illustrated by photographs of Parisian and other buildings, including churches, bridges, railway stations, markets, libraries, and private edifices, in the construction of which iron and steel are employed to a considerable extent, and more or less dominate the designs; and the author quotes Ruskin as saying, in 1849, "that the time is probably near when a new system of architectural laws will be developed, adapted entirely to metallic construction." Mr. Verstage arrives at a conclusion diametrically opposed to that of his successful fellow competitor, for whereas the latter, as we have seen, describes the now general use of iron and steel as a "passing phase," the former states that "we have moved far in the architectural development of iron and steel, and although new laws and new canons have not definitely crystallised, yet, given the continued use of these materials, the time cannot be far distant when the proportions proper to them will be accepted as readily as we now accept those proper to stone."

The Measured Drawings Medal.

Despite the fact that this competition has attracted six competitors, the medal has not been awarded, but certificates of honourable mention have been granted to the authors of the drawings marked "Waynflete" and "Swallow" respectively.

The drawings submitted by "Waynflete" comprise six sheets of very careful brown-ink studies of Magdalen College, Oxford, and those by "Swallow" illustrate, in a singularly attractive manner, that most interesting building, Stokesay Castle, Shropshire. "Swallow" is to be congratulated both upon his powers of draughtsmanship, as evinced by the beautiful drawings he has produced, and upon his happy selection of a building so suitable for the picturesque type of geometrical delineation he has adopted. The measured drawings, marked with the heraldic device of a horse's head and illustrating Kirby Hall, Northants, are accompanied by a badly drawn perspective sketch, and the large scale detail drawing is weak.

"Thrums" has selected for illustration the well-known church of St. George, Hanover Square. The details and ornamentation are not well delineated, and the beauty of the fine west portico has been altogether lost, owing to the want of care or knowledge in drawing the columns and capitals. The full-size mouldings are rather unnecessarily crowded together upon a single sheet, whereby their value is greatly diminished.

The drawings, by "Adze," of Wren's Library at Trinity College, Cambridge, although not very vigorously executed, have evidently been conscientiously prepared.

"Spero" has selected what is now becoming a rather hackneyed subject for measured work, viz. the famous Orangery of Kensington Palace, but his drawings possess considerable merit and show distinct promise of future excellence.

The Travelling Studentships—(I.) The Soane Medallion.

In this competition, for which fifteen designs were submitted, the medallion and the sum of 100*l.* have been awarded to the author of the drawings marked "Cameo," whilst those prepared by "Simplex" and "Urn" have gained honourable mention.

"Cameo's" design is of the now popular Renaissance type, but I am glad to see that its author has not slavishly followed the prevalent fashion to an extent that would have

compelled him to leave a huge gap in his main cornice for the sake of more fully exhibiting the attractions, whether real or imaginary, of an attic storey. But whilst "Cameo's" elevations are satisfactory, there are several blemishes in his design; thus, the four small areas are objectionable features of the ground floor, and the access to the ball-room, on the first floor, is anything but good and direct, and neither the large-scale detail drawing nor the section exhibits a very happy effort of draughtsmanship.

"Simplex" submits a design in which the winter garden occupies the central position of the ground-floor plan. The external architectural treatment is good, but some of the details of the planning are weak, as for instance, in the case of one or two of the bath-rooms on the first-floor, which are, apparently, altogether enclosed by internal partitions.

The author of the drawings marked "Urn" has produced a design that, on the whole, is distinctly the best of those submitted. "Urn's" plan is laid out on broad and simple lines, and his elevations possess considerable merit; but I understand that its author, unfortunately, lost his chance of securing the prize by ignoring one of the salient conditions of the competition.

The time at my disposal does not enable me to do more than briefly mention the other designs, amongst which "Novo" is conspicuous by reason of a well-treated elevation accompanied by a simple and attractive plan. "Aero" and "Applique" both show the influence of trans-Atlantic art. "Pax" has a fairly good elevation, but his sections and plan are rather crude. "Cid's" design is in many respects a meritorious one. "Rush's" drawings include a rather poor-looking perspective, and those submitted by "A.T." are not particularly well prepared. "Dentil's" plan is weak, and "Kokrel's" Greek elevations are hardly suitable for a city hotel. "Silver Shield" has not overcome the lighting difficulty in an altogether satisfactory manner, and the capitals of his Ionic order are incorrectly drawn. "I. Parve's" plan is laid out on simple lines, and its author has happily managed to dispense with small internal areas, but "Pan's" scheme is of far too complex a nature.

(II.) *The Owen Jones Studentship.*

Two applications were received for this studentship, from Mr. Robert Atkinson and Mr. Arthur R. H. Jackson, and the certificate and the sum of 100*l.* have been awarded to Mr. Jackson, of the Royal College of Art, South Kensington.

Mr. Jackson's drawings, which are of far more than average merit, comprise very careful and painstaking water-colour delineations of the ceilings of Raphael's Loggia at the Vatican, mosaics from San Clemente at Rome, the painted barrel vaulted ceiling (by Luini), the later frescoes (by Ferrari), of the dome, and other drawings, sketch plans and elevations of the Santuario Soronno.

Studies from nature of chrysanthemums and three drawings of ornament, showing the conventional application of the studies, a design for a panel and a charmingly coloured representation of a Della Robbia-ware panel from the Pazzi Chapel, Florence, a tempera study after Raphael, and many other beautifully executed sketches and studies are also submitted, and Mr. Jackson is to be highly congratulated upon his brilliant exhibition of thoroughly good and conscientious work.

Mr. Atkinson sends a goodly array of very clever water-colour sketches and measured drawings of well-chosen subjects from notable buildings in Florence, Ravenna, Siena, Rome and Venice, and a finely drawn and coloured design for a lounge and staircase. Mr. Atkinson's drawings are all of a very charming character, but unfortunately, with one or two exceptions, they seem to bear no particular reference to the requirements of a studentship primarily founded for the special study of ornament and coloured decoration.

(III.) *The Pugin Studentship.*

Three applications were received for this studentship from the following, viz. Mr. F. Townson Clark, Mr. A. G. Margetson and Mr. Wilfred I. Travers; and the medal and the sum of 40*l.* have been awarded to Mr. A. G. Margetson.

Mr. Margetson's measured drawings, which are superior to his perspective sketches, include careful delineations of the organ screen and chapter-house doorway from Southwell, a bay of the arcading from the lady chapel at Ely, and other studies. The pencil perspective sketches include drawings of St. Mary's Church at Oxford and many of the collegiate buildings of that city.

Another competitor, Mr. Wilfred Travers, submits many good pencil sketches of well-chosen subjects, including

drawings of the old schoolroom at Uppingham, the Palladian Bridge at Bath, a pier of the Lion gate at Hampton Court, the Guildhall, Peterborough, and others from Gloucester and Lincoln Cathedrals, Crowland Abbey, &c.

Unfortunately Mr. Travers's measured drawings are few in number, and the examples selected for illustration comparatively unimportant.

Mr. Clark sends pencil and water-colour sketches of some of the colleges at Oxford, and a rather weakly delineated measured drawing of no very great interest.

(IV.) *The Godwin Medal.*

Only one application was made, and the Council was unable to award the bursary for this year.

(V.) *The Tite Certificate.*

No less than twenty-one designs for a Loggia for Sculpture were received, and the prize has been awarded to the author of the design marked "Vignola," Mr. G. Salway Nicol, of Birmingham. Mr. Nicol's design fully deserves the honourable position it has obtained, as it possesses the indispensable architectural qualities of good proportion and effective enrichment; but exception must be taken to the manner in which the short entablatures of the Ionic columns (which serve as the impostes of the large semicircular arches) are broken against small rustic pilasters, carrying cartouches, placed in the spandrels of the arches. The pencil perspective drawing scarcely does justice to the undoubted merits of the design.

The author of the drawings marked "Nisi" receives honourable mention for a well-thought-out design, of which the architectural treatment of the main block is decidedly good; but the general effect of the composition is irretrievably spoiled by the relative want of scale apparent in the side colonnades, of which the diminutive Ionic orders and small pavilions seem to bear no architectural relation to the stately and monumental appearance of the main building. Portions of the perspective view are out of drawing, notably the entablatures crowning the coupled Doric columns.

Among other prominent designs, that by "Hermit" is conspicuous for many good qualities, but it is conceived on too ambitious a scale; whilst the design by "Vita," although more in accordance with the spirit of the instructions, is illustrated by rather weak drawings. "Gradus" submits a carefully-thought-out scheme, accompanied by good drawings. "Spread Eagle's" perspective is a poor one, and the author of the design "Forced Draught" has rather allowed his imagination to run riot with his judgment.

"Valhalla's" drawings include a vigorous pencil perspective sketch, in which, however, the Ionic orders do not appear to be very correctly drawn, and the author of the design marked with the device of a "Wreath" submits some carefully delineated elevations. "Heart-easing-Mirth" sends some well-prepared drawings, and "Orne" a wreath set, of which the details are said to be taken from the north porch of St. Paul's Cathedral. The drawings of "Ecclesiastes" are effectively prepared in coloured ink, and "Delta's" elevation is well drawn, but his perspective is unfinished.

"Si Jeunesse savait si Vieillesse pouvait" submits an elaborate design in the French style. The drawings of "Ionicus" and of "Vincit qui patitur" are weak. "Robinson Crusoe" sends a rather crude detail and a poor perspective. "Meg's" design has merit, and "Crown's" is well thought out and illustrated, although the perspective view is spoiled by its heavy colouring. The design of "Altiora Petamus" is fairly good, but the outline perspective is weakly delineated, and "Cheiro's" unambitious scheme is suitably arranged.

The Arthur Cates Prize.

Competitive drawings for this prize were received from Mr. W. W. J. Calthrop, Mr. Frank Dyer and Mr. W. I. Quirke. The prize has been awarded to Mr. Calthrop, who has submitted a number of sketches and measured drawings of well-known examples, including the beautiful centre bay of the south front of Wilton House, the Palladian Bridge at Prior Park, the Banqueting House, Whitehall, and the cloisters of Norwich Cathedral. A sheet of working drawings for a stone dome are also included in the successful competitor's exhibits.

Mr. Quirke sends a set of well-executed measured drawings of the church of St. Nicholas, Old Shoreham, and other studies, including a perspective view and measured drawing of the portico of the church of St. Martin-in-the-Fields, and a well-executed sketch of King Henry's Gateway at St. Bartholomew's Hospital.

Mr. Frank Dyer's selection of drawings comprises a sketch of the tomb of Archbishop de Grey, from York Minster, and one of an oriel window from Lincoln Cathedral. St. Mary's Church, Beverley, York, forms the subject of the measured drawings submitted by this competitor.

The Grissell Gold Medal (for Design and Construction).

Four designs were received in competition for this prize, the subject being a grand stand, constructed of timber, on a racecourse. The medal has been awarded to Mr. W. A. Mellon, the author of the drawings marked "Royal Ascot," who has submitted a clever design of a Renaissance type, which, however, is marred by the introduction of a large semicircular shaped laminated timber rib placed over the central entrance and presenting a rather incongruous appearance.

The design by "Sceptre" appears to be worked out on perhaps more practical lines than that selected for the prize, and its suitable architectural treatment is well illustrated by a meritorious set of drawings.

The designs of "Hurst Park" and "Video" are of a commonplace type of architecture, but the plan of each of these competitors possesses merit, and the practical requirements of a building of the class in question have evidently been well considered.

In conclusion, I must compliment this Institute upon the wonderful zeal and praiseworthy self-denial of those students who have taken part in its competitions for the current year, as is proved by the enormous amount of time and study expended upon the designs and drawings it has been my privilege to examine and admire. I heartily congratulate the prize-winners upon the successful results of their labours, and to those who have been unsuccessful in the struggle, I would point out that an architect's success in the subsequent practice of his profession is not necessarily dependent upon his all-conquering career as a student. Finally, while I can scarcely expect that my estimate of the architectural value of the work submitted will be endorsed in every instance by the competitors, yet I am sure they will all credit me with having founded it upon a perfectly fair and impartial basis, and I advise any student who may, perhaps, feel momentarily disposed to take umbrage at my remarks, to solace himself with the comforting reflection contained in Byron's well-known lines, viz :—

A man must serve his time to every trade
Save censure. Critics, *all* are ready made.

Professor F. M. SIMPSON proposed a vote of thanks to the President for his address, and to Mr. Cross for his careful review of the students' work. The speaker reminded the meeting that last year he was selected to play the part of critic when the work submitted in the competitions was exhibited, and he said he found it difficult to preserve a balance between praise and public censure. The distribution of prizes he thought was always an interesting event in the history of the Institute, but he wished to see more importance attached to it. The work of the students of architecture was a matter of deep concern to their body, for it was by the quality and amount of that work they were able to take account of the ability and energy of the youth of their profession. In alluding to the prizes themselves, Professor Simpson said he had some hesitation on one point. It was true that travelling studentships were greatly coveted, but one might be permitted to doubt whether they were an unmixed benefit. The habit of regular work was difficult to acquire and of enormous value to the student, yet, at the beginning of his career, having gained a travelling studentship, he was released from all discipline and supervision, and off he went to wander where his fancy bade him, to study good or bad art in his own way. Professor Simpson admitted that in some cases travelling studentships had produced good results, but at the same time there were instances where study in that form had resulted in unsettling the student's mind. In this respect France set a good example, and the method of training offered to students in the Villa Medici was one that might be followed by our own students, but he thought it was perhaps hopeless to expect the Legislature to be interested in the importance of a British school of fine arts in Italy.

Mr. J. M. MONRO seconded the motion.

The President then distributed the prizes and studentships:—Essay medal and twenty-five guineas: silver medal and cheque, 26*l.* 5*s.*, to Mr. Victor D. Horsburgh; certificate of hon. mention to Mr. A. Halcrow Verstage. Measured drawings: certificate of hon. mention to Mr. R. Wynn Owen; David Robertson. Mr. Owen I not agree with the award of the Council, and declined his certificate. Same medallion and 100*l.*: medallion to Mr. Harold

Cooper; certificates of hon. mention and cheque, 10*l.* 10*s.* each, to Mr. Anthony R. Barker, Mr. A. J. Pitcher. Owen Jones studentship and 100*l.*: Owen Jones certificate to Mr. Arthur R. H. Jackson. Pugin studentship and 40*l.*: Mr. A. J. Margetson was presented as the successful student. Tite prize and 30*l.*, augmented by 20*l.* from Wimperis Bursary: Tite certificate to Mr. G. Salway Nicol; certificate of hon. mention and cheque, 10*l.* 10*s.*, to Mr. P. Napier Hemy. Arthur Cates prize, forty guineas: cheque to Mr. W. W. J. Calthrop. Grissell gold medal and 10*l.* 10*s.*, augmented by 10*l.* 10*s.* from Wimperis Bursary: medal and cheque, 21*l.*, to Mr. W. A. Mellon. Ashpitel prize: books value 10*l.* to Mr. J. T. Halliday. Godwin Bursary, 1906: medal and cheque, 35*l.*, to Mr. H. Inigo Triggs. Pugin student, 1906: medal and cheque, 40*l.*, to Mr. G. Drysdale.

DECORATION OF THE PALACE OF WESTMINSTER.

IN last July it was resolved to appoint a select committee to inquire and report with respect to the unfinished condition of the rooms in the Palace of Westminster appropriated to the service of the House of Lords, and their approaches. The following members were nominated:—Marquess of Cholmondeley, Earls Brownlow, Carlisle, Liverpool, Lytton, Plymouth, Lords Denman and Stanmore. The chairman was Lord Staunton. There were several meetings, and various artists gave evidence. Finally, their lordships stated that owing to the short time at their disposal they were unable to bring their inquiry to a conclusion, and recommended that they should be reappointed during the next session of Parliament. The following evidence was given by the first witness, Sir E. J. Poynter, P.R.A.:—

Chairman.

You are the President of the Royal Academy?—I am.

Are you acquainted with this building, and the apartments in it?—Yes, I went over it with your lordship yesterday.

What is the impression you have formed in regard to the interior of the building as to whether architectural ornament or painting should be the dominant feature as regards decorative treatment?—I have considered that point, and it appears to me that the architect almost settled that for us by providing everywhere spaces which were intended to be filled with pictures.

Are you aware that the architect did that somewhat under duress, and that it was not part of his original design?—I did not know that.

Sir Charles Barry's original design provided in many places for arcading and architectural ornament, but the Fine Arts Commissioners required the spaces for pictures, and he had to alter his design accordingly.—I was not aware of that, but as it stands the spaces are so provided, and it would be a little difficult to know what kind of architectural decoration would be suitable; to take this room, for instance, I do not quite see how architectural decoration could be carried out in the spaces provided.

Not in this room, but in some parts of the building it might be done?—In some parts of the building it appears to me it might be done.

May I ask in what parts of the building you would suggest such architectural treatment?—Those rooms where some of the panels are already treated with paintings it would be necessary to carry out the work in the same style. For instance, in the room which is decorated with Mr. Burchett's paintings of the kings and queens of England, the upper panels are left as if for wall-paintings; but I do not see why an architectural treatment should not be introduced in the upper panels. Paintings above paintings in regular order do not look very satisfactory, but arcading judiciously introduced into the upper panels would relieve the monotony of the room and would provide spaces perhaps for paintings of single figures or small groups, or such panels might be filled with sculptured decoration. As an instance I might refer to King's College Chapel at Cambridge, where carved coats of arms fill some of the panels very effectively; and there is a more conspicuous instance of it in Toledo, in the church of San Juan de Los Reyes, where there are magnificent coats of arms filling the panels with a very splendid effect. Or subjects in bas-relief or any other form of sculptured decoration might be introduced.

Is there any other part of the building you saw yesterday which you think would be more suitable to architectural

than to pictorial treatment?—I think in almost all the other rooms some of the panels are already treated with paintings, except in St. Stephen's Hall. There the panels are so evidently suited for wall-painting that I think it would be a pity to fill them up with architectural decorations. Architecture is already prominent in St. Stephen's Hall, and the wall spaces are well suited for some kind of pictorial decoration.

If a pictorial decoration were adhered to what, in your opinion, would be the relative merits of keeping them on a very large scale, or of a reduction in the size of the panels?—I should think the panels might in some instances be reduced by borders within the framing of the panels—decorative borders enclosing the picture. I do not think that ought to be carried too far; wall-paintings on the heroic scale are most effective. The paintings in the Royal Gallery, for instance, in the House of Lords are more effective than the paintings in the corridor, which are on a smaller scale. When the paintings are near to the eye the defects of the design or workmanship are more visible than when they are high up. The fault of the paintings in the corridors lies in their being treated more in the style of enlarged pictures than as decorative works. I can imagine that pictures in the corridors treated more decoratively would have a good effect, but on the whole I think the large paintings are more effective. Placed high and above the eye, they demand a large style of treatment and afford more scope for design and for the encouragement of a dignified style of decorative art.

Earl of Plymouth.

With regard to what you have just said, St. Stephen's Hall is another instance where the decoration would be rather lower down. It comes below the windows, does it not?—Yes. Of course, what I say is subject to limitations. The effect in the corridors is certainly not good, but whether this is due to the fact of the paintings being too near the eye or to their not being suitable to the architecture is doubtful.

What I had in my mind to ask you was this: the architectural treatment, so far as St. Stephen's Hall is concerned, would have, I suppose, to follow the Perpendicular style—that is, you would have to treat the wall as plain stone with mullions brought down through the stonework?—Yes. As regards the architectural work I ought to have said that everything, of course, ought to be done in accordance with the style of the building.

It would convert it really into a stone hall without any other decorations?—Yes; you mean that the decoration would be by perpendicular mouldings carried through from above.

Yes; and it would depend entirely upon the glass windows for any colour in it?—Yes. Of course there is an enormous amount of space provided for painting, and it would be a very long time before it could all be filled up. It would be an advantage in that way to have one of the rooms treated with the arcaded panelling. There is plenty of scope for painting still in the Royal Gallery and on panels in the other rooms which are not painted, without beginning on St. Stephen's Hall.

Chairman.

With regard to that I would like to ask you to look at the drawing in this book, where the marker is put in, of an arch in St. Stephen's Chapel. (The drawing is placed before the witness.) In your opinion, is not that kind of painting more in consonance with the feeling of the Perpendicular style than large paintings?—You mean the painting of these figures in the panels? I think perhaps they are more in accordance with the style of the building, but I do not think one should adhere too strictly to style in these matters. There are places about the palace in which the kind of decoration shown in this drawing might be appropriate, but I think it is possible to be too pedantic in the endeavour to be consistent, and produce an imitation of a Mediaeval building. I do not think that an exact adherence to style in all details is absolutely necessary—it is only necessary that there should be some accordance with the style of the work all through.

Earl of Carlisle.

In looking round the building, have you formed any opinion as to the comparative claims of the different spaces for treatment?—You mean for immediate treatment, I presume?

Obviously it would be impossible to undertake the whole of the work at once. I presume whatever is done would have to be done gradually. Have you focussed any

opinion as to what spaces or what parts of the building most pressingly require treatment, and what, supposing work is done, it would be best to begin with?—It appears to me the wisest thing would be first to complete the halls or galleries that are at present incomplete; for instance, the Royal Gallery, where Maclise's paintings are, is at present partly filled with paintings, but there are several panels which are not filled. It is the same, I believe, with the King's Robing Room—there are a certain number of Dyce's beautiful paintings, but three or four panels are not filled at present; I should have thought the right thing to do was to begin with the work of completing the unfinished rooms.

Chairman.

None of the panels are filled in St. Stephen's Hall?—No.

Earl of Carlisle.

But your view is that it would be desirable to complete things that are already begun?—I think if it were my own house that is what I should prefer. I am not making any objection to beginning with St. Stephen's Hall, but it appears to me that the other would be the more obvious course.

I was asking you what you thought would be the best place to begin with, and you say the Royal Gallery?—I should say so; if I had the control of it that is what I should do.

Chairman.

I think you are the designer and executer of the two mosaics in the central hall?—Yes, those were my work.

There are two panels vacant there still, I believe?—Yes and there are other panels in the building that might be dealt with in the same material. There are some panels still vacant over the paintings in one of the rooms where mosaic decoration would be effective. I do not think mosaic suitable for any position near the eye, but where there are upper panels they might be decorated with mosaic with great effect, partly because mosaic always looks best with reflected light, especially if there is gold in it—it does not look well in a direct light, because the gold always overpowers the colouring—but where you have a reflected light and the gold does not receive a direct light a gold background to a mosaic is extremely beautiful. I should certainly confine mosaic to the higher part of the building.

Then I pass to the next head, about which I wanted to ask you, which deals with just that subject, namely, in what proportion you think these spaces might be most appropriately filled, whether by painting, mosaic or tapestry, and whether there are any parts of the palace which appear to you to be more suitable to any one of these methods of decoration than the others?—Tapestry is very effective anywhere. Very large tapestries would be very effective in a room like this, for instance, but I do not see why the panels in St. Stephen's Hall should not be filled with tapestry—it would be very effective. Tapestry must be put in a good light, as it absorbs light; it is no use putting tapestry in a room where there is not plenty of light. But I suppose there would be great difficulty in getting tapestry suitable for the purpose.

Do you mean difficulties of expense?—And also difficulty in finding it. I do not know whether, in speaking of tapestries, you refer to getting ancient tapestries or to having tapestries made.

I was at the moment thinking of the Morris tapestry in Exeter College?—I have not seen it there. You mean, take it, that it would give an opportunity for promoting a school of tapestry. I think tapestry would look very well in St. Stephen's Hall.

(To be continued.)

The Curator to the Liverpool Corporation, in his report to the library, museum and art committee on the Holman Hunt Exhibition, states:—It has been more than usual difficult to obtain the results desired, because a large number of Mr. Hunt's more important pictures have already been out of their owners' possession for several months. The London and Manchester exhibitions, and there has been a natural unwillingness to be deprived of them for a further period. The curator, however, is glad to report that eight of the eighty-four pictures on view at Manchester have been secured, that five of the seven pictures previously shown at London, but not at Manchester, have been secured, and that in addition nineteen works not previously shown at any recent exhibition, several of the first importance, have been added to the list. One or two others may possibly be secured. There is, therefore, good reason to hope that the exhibition will be by far the finest collection of Mr. Holman Hunt's work ever shown.

A New System for Building Houses, &c.

SIR,—After long and careful consideration and making experiments and tests, I have arrived at the following conclusions:—A dwelling-house should be thoroughly dry, vermin-proof, weatherproof, fireproof and well ventilated. To do this successfully the timber employed must be old and well seasoned. After being cut to the sizes required—viz. rafters, beams, joists, &c.—these must be prepared with wood preservative, which is a preventive against vermin, fungi, dry rot, &c., so that the timber can be placed in water (if necessary). The timber-frame house can then be filled out with thin asbestos cement slabs, both externally and internally (ceilings, walls and floors). These asbestos cement slabs are extremely strong, fireproof, sound-proof, vermin-proof and weatherproof, and resist damp rising from the soil, such as a clay soil, &c. The spaces between the exterior and interior asbestos cement slabs to be filled out with broken bricks, concrete, mortar, &c. All timbers, either externally or internally, to be painted with asbestos fireproof paint. This paint dries hard, does not blister, crack or peel off, either under the sun's heat or the fiercest fire; the roofs to be covered with asbestos cement slates, which are much cheaper than the natural slates or tiles now in use. They are unbreakable and indestructible, and can be used over and over again, such as taken from old roofs and fixed again on new roofs. Buildings erected upon this system can have much thinner walls than either stone or brick buildings, and are far stronger and last longer, requiring no repairs, such as repointing, reslating and replastering, &c. All the materials are much cheaper, stronger and better than those in use at the present time. Directly a house is built it can be inhabited, as there is no waiting for plaster or cement to dry, &c. Building operations can be carried out in any season of the year according to my system. These houses being built of a non-conducting material are warm in winter and cool in summer, and are especially suitable for motor-houses, boat-houses, railway stations, sheds and all buildings where there is a large traffic going on, also cold storage, fireproof warehouses and offices, &c. According to this system old buildings can be made fireproof, weatherproof, damp-proof and strong at a comparatively small cost.—I am, sir, your obedient servant,
HENRY H. B. SANG, architect.

An Architect's Dilemma.

SIR,—Could any of your readers advise me under the following circumstances? I had a client I designed and superintended the carrying out of ten villas for. An objection was that we had provided too many rooms, mostly small (against my wishes), and although they all let this difficulty arose whenever he was letting. He had more land, and I designed some twenty more, getting over that difficulty, rents ranging from 45*l.* a year to 75*l.* My client died suddenly about two months back, and no correspondence had taken place between us, and no witness can be produced of my preparing these further plans and elevations at his request. His executors now repudiate the whole affair, and have instructed the local auctioneer and surveyor to prepare plans. Have I any redress, and if so, can I commence proceedings? My solicitor thinks I have a very poor chance, and suggests my not attempting it. Thinking possibly some of your readers may have had a like experience, I venture to ask you to publish this letter for

A YOUNG PRACTITIONER.

British and Foreign Marble Working.

SIR,—In explanation of enclosed letter and its delay in being forwarded on to you, we beg to state that the meetings of our Association are held every Saturday evening, and upon your issue of January 25 being brought to our notice (the same evening), the members voted that a letter should be drafted and read at the next meeting, which was duly done on the 2nd inst. It was then voted that we forward the same on to you, trusting you will do us the honour of publishing the same.—Signed on behalf of the Stone Carvers' Trade Association,

H. J. HERRIDGE, President.

ALBERT E. HARRIS, Vice-president.

Sir,—After perusing the account of the R.I.B.A. meeting in your issue of the 25th ult., some of the chief points were

discussed by the members of the Stone Carvers' Trade Association, who have long deplored the apathy shown to the British workmen in the marble trade.

In recent years carvers in this country have suffered to the extent of many thousands of pounds by imported worked materials, and in some cases grave suspicions rest on the British employer as to whether he has not for his own personal ends subcontracted work to foreign manufacturers and passed the same off as the work of British craftsmen.

It is a fact that a large marble hall erected on an estate in Suffolk a few years ago was mostly worked in a foreign country by foreign workmen from models actually taken from the small portion done by our own carvers and masons in London, who were thus in the unenviable position of knowing that the bulk of the money would go to the foreigners for copying that which British brains had supplied. So this instance proves in itself it is not the incompetence of our craftsmen to carry out the work.

One of the authors is reported to have said in the opening paragraphs of his lecture:—"He laments the fact that the bulk of the money spent in marble in this country should go to foreign manufacturers and workmen." We, the members of this Association, would like to ask him if he has not placed many of his works in the hands of the foreigners to the detriment of the workmen of this country?

The same author also says, "He regrets that this country imports annually thousands of tons of ready-made monuments in marble and granite for cemeteries and churchyards, most of them devoid of artistic character of any sort." With these remarks we are sincerely in accord, and we positively believe that if only three-fourths of the imported work was done in this country 90 per cent. of the masons and carvers at present out of employment would have plenty to do.

Mr. Hugh Stannus, in his reply, remarks on "The wonderful development of the use of marbles in their theatres, restaurants, town halls and other public buildings." We ask, is it not most deplorable that the public officials should permit the public money to be spent in a foreign country on work which could be done at home to the mutual benefit of those who help to raise the funds?

THE MEMBERS OF THE STONE CARVERS'
TRADE ASSOCIATION.

"The White Bear," Kennington Park Road, S.E.

Letchworth Housing Exhibition.

SIR,—The importance of matters that affect housing is now so widely recognised that we venture to draw the attention of your readers to the exhibition of urban cottages and homesteads for small holdings to be held at the Garden City, Letchworth, this summer. The project is an attempt to develop and extend the experience gained by the Cheap Cottages Exhibition of 1905, while avoiding the defects—some of them inevitable in a new project—for which that exhibition was criticised. In the exhibition for this year prizes will be offered in seven classes, arranged according to cost of erection, which will be held to include architect's fees and builder's profits. In the urban section, the limit of cost will vary from 175*l.* to 240*l.* for each house; in the small holdings section from 200*l.* to 300*l.*; while there will be a separate class for the best artisan's cottage not limited as to cost. It is hoped that the fullest scope will thus be given for the building of comfortable and well-designed houses, suitable for artisans and allotment-holders. With regard to cost of erection, effectual means will be taken to provide that all buildings entered for competition are entered at the price for which they can actually be erected. Not only will detailed specifications in every case be required, but all competitors will have to undertake, either to sell their cottages to the Garden City Co., if called upon to do so, at the price quoted in the catalogue, or to erect on the estate other cottages exactly similar at the same price. On the other hand, when the cottages are not taken over a rent amounting to 6 per cent. on the stated cost in the urban section and 5 per cent. in the small holdings section will be guaranteed to the exhibitor for a period of five years. The arrangements will thus be placed on a thoroughly sound and businesslike footing, and practical results of the utmost value to municipalities and others engaged in building work may be looked for. The present rapid development of Garden City offers a unique opportunity for such experiments.

The project derives additional importance from the fact that the Annual International Housing Congress is to meet

this year in London. One of the first excursions of delegates attending that Congress will be to the Letchworth Garden City to visit this exhibition.

On these grounds we desire to make a double appeal for support—(1) to builders, architects, landowners and others to enter for the competition, the plans for which must be submitted not later than February 28; and (2) to the general public to contribute to the prizes fund.

The liability for working expenses will be borne entirely by the First Garden City, Ltd., on whose ground the exhibition will be held; but a separate fund, which will be administered by our committee, is being raised for prizes. Donations to this fund should be sent to Messrs. Barclay & Co., Hitchin, Herts, or to the hon. secretary, Mr. W. V. Cooper, at 326a High Holborn, W.C., from whom full particulars may be obtained.—We are, yours faithfully,

(Signed) SALISBURY, President.

PHILIP MORRELL, Chairman of Committee.

W. THOMPSON.

F. E. FREMANTLE.

W. V. COOPER, Hon. Sec.

GENERAL.

The Exhibition of the remaining works of the late James Charles will open on the 9th inst. at the Leicester Galleries, Leicester Square. All periods of his work will be represented in about seventy canvases, and the exhibition will also include some water-colours and black and white drawings.

The Secretary of the Scottish Patriotic Association has received from H.M. Office of Works the following communication, indicating the non-success for the present of Mr. D. M. Smeaton's efforts to have the Borestone scheduled under the Ancient Monuments Acts:—"Referring to your letter of the 24th inst. and to previous correspondence on the subject of the proposal to place the Borestone of Bannockburn under the guardianship of the Commissioners of H.M. Works under the provisions of the Ancient Monuments Acts, I am directed by the First Commissioner of His Majesty's Works, &c., to state, for the information of your Association, that the Board have been in communication in the matter with the proprietor, who, while expressing his willingness to entertain any suggestions, is not prepared to accede to the transfer." The Borestone is situated on the estate of Mr. James Murray, of Polmaise, and lies close to the old Roman road at Bannockburn.

The Lord Provost's Committee of Edinburgh Town Council had before them a suggestion by the markets committee that the new art school to be erected on the site of the Lauriston cattle markets should be built in sections, so that while one section of the school was in course of erection the remainder of the site would be available for the purposes of the cattle market. The suggestion was made in view of the fact that it will be some time before the new markets at Gorgie are completed. It was remitted to a sub-committee to consider whether the proposal, if it were given effect to, would seriously delay the erection of the art school buildings.

The Vicar of Selby states that the work of restoring the abbey has now been seriously commenced. Contracts have been let for the roofing of the entire building. The lower piers are to be underpinned forthwith, and there can be no doubt that, given fair and open weather, the nave will be reopened for services in the autumn of this year. The anniversary of the calamity, October 20, will fall this year on a Sunday, and the latest date for the reopening of the nave must, the rev. gentleman states, be the eve of the fire, viz. October 19.

A Pre-Reformation Altar, dug up from the floor of Almington parish church, near Chepstow, has been fixed in the church. The Church Association has protested to the Archbishop of Canterbury, stating that the "altar is a Roman Catholic altar, and inviting the Archbishop to take such steps as were fitting to secure the speedy restoration of Almington Church to a due conformity with the ritual requirements of the Protestant religion." The Archbishop in reply said that it did not appear that the question was one with which he had anything directly to do.

Sir John Wolfe Barry will act as arbitrator between the Guildford Corporation and the Woking Water Company in regard to the purchase by the Corporation, under their recent extension order, of part of the company's undertaking. The company ask for 105,000*l.* and the Corporation offer 18,700*l.*

The Fifty-fourth Annual Meeting of the American Society of Civil Engineers was held in New York on January 16 several hundred corporate members being present. The Norman medal was awarded to Captain John S. Sewell, U.S.A., for a paper entitled "Economical Design of Reinforced Concrete Floor Systems for Fire-resisting Structures." The Thomas Fitch Rowland prize was given to Messrs. W. F. Denis and Geo. B. Francis for a paper on "The Scranton Tunnel of the Lackawanna and Wyoming Valley RR." No award of the Collingwood prize was made this year. The Society voted to issue a letter ballot to determine whether a committee shall be appointed to investigate the status of engineering education and recommend measures calculated to place it on the highest plane of efficiency.

It is Proposed to provide a new vicarage for Burgess Hill Sussex, at an estimated cost of 2,000*l.*

Messrs. Ould & Grayson, of Liverpool, have been appointed architects for the secondary schools to be erected by the Cumberland education committee. A proposal to obtain designs by competition was rejected.

M. Coutan, sculptor, is to receive the sum of 2,000 francs bequeathed by the late M. Lheureux for the encouragement of art.

The Committee for the erection of a memorial to Aspatia to the late Sir Wilfrid Lawson have met. Mr. Roselieb, the sculptor, and have decided to retain St. George and the Dragon as the surmounting figure above the drinking fountain. Lord Carlisle, who was called in to adjudicate on the designs submitted, had suggested a figure of St. Michael.

A Tablet is to be fixed by the London County Council on 33 Ampton Street, Gray's Inn Road, W.C., which was the first London residence of Thomas Carlyle.

M. Albert Thomas, who was one of the best known French architects, has died in Paris. A native of Marseilles he was winner of the Prix de Rome in 1870, and designed a part of the Grand Palais in the Champs-Élysées.

An Exhibition of drawings by the late Aubrey Beardsley was opened in Paris on Monday. It will close on March 2.

The Museum of the Hawick Archaeological Society is to be handed over to the local Corporation for the public benefit. The collections will be deposited in Wilton Lodge mansion-house, and the Society will contribute 450*l.* toward the cost of cases, &c.

The Main Drainage Committee of the London County Council state that as the third section of the sewer between Stepney and Trafalgar Square will, in its course, pass to the south side of St. Paul's Cathedral, they have been in communication with the representatives of the Dean and Chapter with regard to the manner in which the construction is to be carried out at this point, and they are satisfied with the proposed arrangements. It is anticipated that the work will be executed in the vicinity of the cathedral before the end of the year.

Mr. A. A. Hudson will read a paper before the Surveyors' Institute on Monday upon "The Ventilation of London."

Mr. G. H. Grocock, of Bedford, has been successful in the competition for the new schools at Newark-upon-Trent to accommodate 600 children.

The Croydon Borough Council is again in dispute with the London County Council over matters relating to the erection of houses on the estate at Norbury. On the plan recently presented for fifty-two new cottages the Spring Gardens authorities proposed a system of drainage not allowed under the Croydon by-laws. The Croydon Council has therefore decided to serve notices requiring a separate drain for each house with manhole and trap complete.

In a Review of a book on "Painters' Colours," which appeared on January 25, there was reference to "Charlton white." As our readers are aware, that paint was invented by Mr. J. B. Orr, who continues to manufacture zinc white on a large scale.

A Copy of Watts's fresco in the hall of Lincoln's Inn made by Mr. N. M. Lund, has been fixed in the Bar Library of the Royal Courts of Justice.

Lord Strathcona (High Commissioner for Canada) is informed by the Minister of the Interior at Ottawa that contractors in Canada state that 20,000 men will be wanted this year for railway construction. The Grand Trunk Pacific Railway Co. alone will require 10,000 men to conduct their summer operations.

The Architect.

THE WEEK.

ALTHOUGH many memorials are set up every year in France, it is rare that one is made the subject of a law-suit. One reason, no doubt, is that each is generally the work of one artist. An architect may occasionally co-operate with a sculptor, but in the majority of cases the sculptor obtains all the credit. A departure from the old method has occurred in respect of the memorial to EMILE ZOLA, the novelist. As he was the most prominent representative of realism, it was decided that a realistic sculptor should have the commission. CONSTANTIN MEUNIER, the Belgian, some of whose representations of miners and ironworkers were seen last year in London, agreed to undertake the work. But he desired to have jointly with him ALEXANDRE CHARPENTIER, the French sculptor. The price of the work (which was to be divided between them) was 90,000 francs, and each artist was to pay all expenses for assistance, &c., which would be in his part of the work. The models were completed. There was to be a statue of ZOLA flanked by the figure of a workman and of a woman with a child. Symbolic figures seem now in favour, and standing behind the novelist was one symbolising Truth, who wore a crown of laurels in her hand. The committee could not approve of it, and it was decided to substitute a relief, to be placed on one of the faces of the pedestal representing ZOLA at the assizes, to which he was summoned for the part he had taken in the DREYFUS case. The bas-relief was to cost 9,200 francs, and it is over the division of that money the action now before the French Courts has arisen. MEUNIER is dead and the action is brought against his heirs by M. CHARPENTIER. The work was arranged to be delivered on June 1, 1906, and the committee expect to have it on April 1, 1907.

Two years ago the Bishop of BIRMINGHAM appointed a commission to report among other things on the new buildings needed in the diocese. Great care was exercised in ascertaining the requirements. The report has appeared. A great many central halls, mission-rooms and parochial rooms are called for. In some places there is also a necessity for churches and vicarages. The church of St. Mark, it is pointed out, is built with soft red sandstone and is rapidly decaying. It is recommended that the church should be pulled down and a new building erected. Various suggestions are offered about alterations in the boundaries of some of the districts. For that purpose a map committee was appointed and an invaluable map was produced. It would, however, be too costly to multiply and distribute, although if reproduced it would be a valuable gift to the diocese. In ascertaining the accommodation of churches and mission-rooms required, the committee assumed that the basis should be one sitting for every ten inhabitants. The calculation only refers to Birmingham and its suburbs, for in the country districts the churches are on the whole large enough, though in some parishes the accommodation needs to be increased.

THE resolution of the Cumberland education committee appointing Messrs. OULD & GRAYSON, of Liverpool, to prepare plans for a girls' school at Carlisle and a mixed school at Whitehaven has not been received with approval by the local practitioners. A petition signed by nineteen Cumberland architects has been sent asking that the subject should be referred back to the education committee, with a view of giving those who desired an opportunity of submitting plans in competition, subject to the usual arrangements and decision of a competent assessor. With their knowledge of what had transpired elsewhere in connection with schoolwork the

general rule was to confine work to architects practising in the county, and the petitioners asked that such a rule should be adopted in this case, or that an equal opportunity might be given to them of submitting designs in competition with other members of the profession. It was suggested that one school might be erected from the designs of the Liverpool architects, but that any others should be thrown open to competition. There was a long discussion, but eventually the action of the education committee was approved. Lord MORPETH said that from his own experience of competitions they were nearly all thoroughly bad. It was stated that the Board of Education had approved of the arrangement, and that Messrs. OULD & GRAYSON had erected secondary schools in various parts of England. The Chairman remarked, in reply to the statement that the petitioners were ratepayers, that if one of the Cumberland architects had been selected he might have produced plans which would not have met with the sanction of the education committee and caused considerable expense to the county. The architect would have benefited himself, but his brother architects and ratepayers would have had to pay a great deal more. He did not think it was an argument that should be used, that they ought to go to a Cumberland architect because he was a ratepayer.

THE report of the committee of inquiry into the working of the Royal Hibernian Academy and the Metropolitan School of Art is likely to be discussed in the House of Commons. The following memorial against the proposals has been presented:—"That we, the undersigned, beg to enter our strong protest against the recommendations of the majority of the Parliamentary Committee of Inquiry into the Royal Hibernian Academy and Metropolitan School of Art, which are aimed at depriving the Royal Hibernian Academy of its academic function, as this must inevitably tend to its abolition and the discouragement of art in Ireland. We consider this to be a most untimely proposal at a moment when so much independent effort is directed to develop art in our country." In the drawing-up of petitions certain technical points have to be observed. That may be the reason why the memorial is less expressive than is desirable. The Royal Hibernian Academy has been during several years subjected to the authorities at South Kensington, and to an impartial member it is likely to appear less humiliating for the control to be exercised by an Irish Department. There does not seem to be much relation between art and agriculture. But, after all, "What's in a name?" The great objection to the report is the suggestion that the Academicians are incompetent to aid in the promotion of Irish art, while the true obstacles to progress are to be found in another direction.

THE promontory of Sunium was the site of two temples, one dedicated to ATHENE, the other to NEPTUNE. The white columns which are now so remarkable in a view from the sea are believed to belong to the former, and ATHENE would thus appear to be the guardian of Attica. The second temple is supposed to have stood on a hill to the north-east. In the latter position has lately been found by the German explorer, Herr STAIS, a colossal archaic figure of a youth as well as a torso of a second statue, which apparently served as a pendant. One is thought to be APOLLO, and, indeed, it is imagined that the second figure also represented the god. In size they must have been equal to the APOLLO of Delium, but the muscular development and the careful arrangement of the hair are also remarkable. It is considered that the two figures stood as guardians of the treasury in which offerings to the temple were placed. DODWELL, the English traveller, it may be remarked, considers that the whiteness of the Temple of ATHENE is owing to the effect of the air, which contains sea-salt, and, instead of the golden patina seen in the Parthenon, exhibits the original whiteness of the marble.

THE PALACE OF THE LUXEMBOURG.

ONE of the prizes which the French Academy can bestow serves as a memorial of CHARLES BLANC, who was about half a century ago respected as a law-giver on all subjects connected with art. It is awarded to writers who, like him, produce a book or books on art, and among the latest recipients is M. HUSTIN, one of the secretaries of the French Senate. That body holds its sittings in the Palace of the Luxembourg, and the prize was awarded for an elaborate account of the buildings and the works of art they contain.

The history of the palace is remarkable, for it was erected by a foreign queen who was disliked while she was alive, and whose memory is not respected. Readers of DUMAS's novels, without going deeper, will learn a great deal about MARIE DE MEDICIS, the wife of HENRI IV., and daughter of the Grand Duke of TUSCANY. She was married to HENRI in her twenty-seventh year, and he was supposed to have acted prudently, for although she had neither beauty nor intelligence she possessed a fortune of fifteen millions of francs—a sum that was of immense advantage to her husband. Ten years afterwards HENRI was assassinated. It was necessary that MARIE should become regent, for her son LOUIS XIII. was only a child of nine. Her office was difficult to fill, and the queen must have expected some kind of revolution by which she would be rendered homeless. Accordingly, in 1612 she purchased the mansion of the Duc DE PINEY-LUXEMBOURG, and during the following years she secured ground near it. In 1615 she was able to give instructions to SALOMON (JACQUES) DE BROUSSE to commence the erection of a new palace. She stipulated that it was to resemble the Palais Pitti in Florence, where she was born. But the Luxembourg is far from being a copy of the Italian building, for French details were liberally introduced in it.

DE BROUSSE belonged to a family of architects, and it is believed he was born in 1560. So much expedition was exercised that in 1620 a large part of the palace was in a condition to allow it to be occupied. The queen, as became an Italian, was fond of fountains, and she ordered that a conduit should be carried from the village of Arcueil, where there was a water supply, to the gardens. The beautiful fountain in the garden, sometimes called the Fontaine de Medicis and sometimes the Fontaine de Brosse, was created. But in the course of time it has been greatly altered. Much attention was given to the gardens, in which the French and Italian styles were commingled. They were originally laid out by DE BROUSSE.

MARIE DE MEDICIS was also desirous that she should have a memorial created by the painter's art as well as by the architect's. In 1620 RUBENS, who was then at the height of his reputation, was summoned to Paris in order to confer with the queen about representations of the events of her life. Twenty-one paintings were commissioned. The series began with *The Destiny of Marie de Medicis* and ended with *Time Disclosing Truth*. One subject was the happiness and prosperity of the Regency. Owing to alterations in the palace the paintings were afterwards removed from the Luxembourg, and they are now to be seen in the Louvre. Allegorical figures and fabulous deities were freely introduced as part of the historical scenes. No doubt they impart variety to the compositions, but it must be allowed that several of the figures instead of elucidating seem to obscure the meaning of some of the pictures. RUBENS at the time had so many able assistants and pupils, his studio in Antwerp could be considered as a factory. Although he had other works in hand, the twenty-one immense paintings for the Luxembourg were completed in less than two years—nineteen in Antwerp and two in Paris. RUBENS superintended their erection, and was most liberally rewarded by MARIE DE MEDICIS. At a later time the Duke of BUCKINGHAM, who was in Paris at the celebration of the nuptials of HENRIETTA MARIA with CHARLES I., met the painter in the gallery,

and thus formed a connection which led to commission from the English king.

A description of the palace appeared in 1616, which mention is made of the paintings by RUBENS. Before entering the gallery the visitor, it was said, passed through the chapel of the queen, in which gallery was largely used. The queen's chamber was remarkable for a chimneypiece, and the bedstead had pillars of silver. The flooring of the queen's cabinet was of marquetry, the chimneypiece was all gilded and the windows were of a fine crystal. In another room the victories of the young king LOUIS XIII. were represented, for no doubt LOUIS took all the credit for the efforts of RICHELIEU. In the next century BLONDEL the architect, declared the building to be a *chef-d'œuvre*. He admitted the virile character of its ordonnance, the severity of its forms, the purity of its mouldings and the air of antiquity which was to be found in the general effect as well as in the details. But, like FERGUSON at a later time, BLONDEL objected to the monotony of the rustication, which is carried to excess. BERNINI, however, said he had never seen a palace that was less built or more regular in treatment.

However well built, the Luxembourg was not strong enough to protect MARIE DE MEDICIS from her enemies. She had endeavoured to make RICHELIEU at first her agent. But finding that "the ungrateful servant" as she called him, had vast schemes of his own, she manoeuvred to ruin the cardinal. She failed and was ordered to leave Paris for Compiègne. From there she fled to Brussels, where she was compelled to depend on Spanish generosity for sustenance. She believed the queen died in Cologne in the most abject misery.

MARIE DE MEDICIS left the palace to her son GASTON. Afterwards it became the property of the Duchesse de MONTPENSIER, and was known as the Palais d'Orléans. LOUIS XIV. obtained it in 1694. In the course of his reign it fell to LOUIS XVI., who made it over to his brother who was afterwards known as LOUIS XVIII. BERNINI, CHALGRIN, the architect, who was to design the new Arc d'Etoile, was commissioned to prepare a report on the restoration of the Luxembourg. Before any work could be executed the Revolution broke out. CHALGRIN was ordered to prepare the building for the accommodation of the Directory. Then 250 armourers' figures were set up in the gardens of the Luxembourg, and afterwards the palace was used as a prison, as CARLYLE says, "a huge loathsome prison." CHALGRIN, anticipating the course of events, fled to Brussels. He left his young wife behind him, and she was arrested as an aristocrat. DAVID, the painter, who was supposed to be her friend, might have saved her, but he decamped and she was one of the victims of the guillotine. DAVID was also fated to become a prisoner in the Luxembourg, and it is said he made the first sketch of his most famous work, *The Sabines*, while confined there. Many of the leaders of the Revolution remained captives. By a whim of the guiding spirits it ceased to be a prison and became the seat of the Government. When NAPOLEON made his *coup d'état* he used it, and it was known for a time as the Palais du Consulat. Afterwards it became a Senate House and then the House of Peers. During his trial Marshal NEY was confined in the librarian's room. Many other political prisoners became acquainted with it. Under the Third Empire it was reconverted into a Senate House, which it continues to be at the present time.

Under NAPOLEON I., CHALGRIN was again allowed on to devise the alterations necessary for the sittings of the Senate. He made several alterations, especially in the interior, and among others removed the original staircase and transformed the gallery where RUBENS's paintings were fixed. They were in consequence removed to the Louvre, where they are at the present place. Under LOUIS PHILIPPE further changes became necessary, and M. DE GISORS was appointed architect. From his writings he might be supposed to have

genuine admirer of the work of DE BROSSE. But his notions are not of a kind to enhance the beauty of the work. It is not difficult to discriminate between the work of the seventeenth and that of the nineteenth century.

In the time of MARIE DE MEDICIS the principal parts of the Luxembourg must have appeared resplendent in silver and gold. It suggests the change in the character of the proprietorship when it is found that no painters were employed on the palace until after the fall of the first Empire. Under LOUIS PHILIPPE scriptural and other paintings were commissioned for the chapel. Sculpture was also introduced. But under NAPOLEON III., the emperor was acquainted with the palace as a prisoner, and it was made to suggest the greatness of his uncle, an apotheosis of NAPOLEON I. appeared on the walls of the Throne Room. Some of those Imperialist embellishments are now covered with simple panels. Under the present Republic sculpture appears to find more favour than painting, and several examples have been obtained, especially for the adornment of the gardens. Of late years the friends of poets and artists have preferred sites in the gardens for memorials to be set in Paris streets. In consequence the gardens have been destined to become a rival or a supplement to the Panthéon in upholding the fame of representatives of two classes of the great men of France.

AN AMERICAN HISTORY OF ARCHITECTURE.*

At one time in the United States everything relating to the past was undervalued. To the Young American the present was all-sufficient. "I can find Greece, Asia, Italy, Spain and the Islands," said HERSON, "the genius and creative principle of each of all eras, in my own mind." The aim of every inquiry into antiquity, according to him, was to substitute the Here and the Now—i.e. an American town of the nineteenth century—for the preposterous There and the Then of the Old World. In that spirit alone the past was to be studied by the superior beings of New England. It was a natural outbreak of conceit among people endowed with so large a part of the earth's surface for their operations, and who were not fettered by tradition. They had also at their command steam and electricity, which were more powerful than the armed Titans.

It was not long before the Americans discovered that the past was possessed of treasures, and to obtain their share they must imitate the example of many generations of benighted Europeans. The lesson was not taught through the agency of architecture. Although its "philosophy" was plain to all, a new style of distinctive American character did not spring up at command. If there were to be beautiful buildings in their towns it was necessary for the designers to have recourse to the antiquated forms which were in use in ancient Egypt, Greece and Italy. An effort was made to surpass the old architects, for having once blocked out the heart of the mystery of the art there seemed to be no reason why they should not become more Egyptian than the Egyptians and more Roman than the Romans. But superiority was not attained in this way. Better results, it was found, were secured by looking at Classic art through British eyes. Now, as the President remarked at the late celebration of the foundation of the American Institute, there is a fear that through the ready access to the architecture of the world and from the training derived in foreign schools, they are not unlikely to forget the interpretations of antiquity which were the work of English minds, and to attempt others of an inferior kind.

A History of Architecture: having special regard to the Natural Artistic Results of Construction and those Methods of Design which are the result of Abstract Thinking and of the Pure Sense of Form. By Russell Sturgis, A.M., Ph.D. Vol. I.: Antiquity. Three hundred and forty illustrations. (New York: The Baker and Taylor Company. London: B. T. Batsford.)

While we desire that American buildings, as well as American books, should be reminiscent of England, it would be satisfactory if there were also American theories of art, literature and history. What is ancient is likely to gain in value if it can be considered from points of view which hitherto were neglected. On that account we are glad to welcome the experiment of Mr. RUSSELL STURGIS. As well as we can judge from the first volume of his "History of Architecture," it is not intended to explain art by a theory of races or one of evolution; nor does the author confine himself to descriptions of the ornament of ancient buildings. He considers the buildings as creations in which skilful construction as well as painting and sculpture were combined. In doing this he is rigorous in keeping to evidence that will be acceptable and deductions that are warranted by the remains. Imagination is not exercised, for when there are only dubious grounds existing on which to base a statement the reader is informed of the deficiency.

The author therefore avoids a discussion about the origin of architecture, and there are no descriptions of prehistoric structures. He starts with Egyptian architecture. At the beginning of the first chapter we have an example of the logical method employed, and by which the reader is enabled to distinguish between definite and indefinite evidence. Mr. STURGIS, in referring to the ordinary houses of the old Egyptians, built of half-dried mud and framed construction, asks:—

What is the evidence as to these long-perished buildings? First, as to the wood-framing, the evidence is in the sculptured walls of tombs, both on their inner and outer faces. The sarcophagus of Menkaura found in his pyramid, the third in size of the pyramids of Ghizeh, was an enormous monolith of basalt, which would be accepted at once as the sculptured representation of a one-storey house framed of light, squared posts and horizontal bars. Every part of the surface of the hard stone is sculptured in relief with this representation of framework, the only additional ornament being a limited use of the lotus flower. The inner wall-face of a tomb at Ghizeh shows a similar decoration covering an end wall in a mastaba very near to the Great Pyramid of Ghizeh, on the east. It is about 14 feet long from left to right, the width being about 5 feet. At the outermost corners of a recess in the middle the depth is about 5 inches, and the middle panel from top to bottom is recessed about 5 inches more, these measurements being to the face of little upright strips, which clearly indicate studs of squared wood, having horizontal interstices of smaller section. The only ornament other than this copying of wood-framing is in the pretty sculpture of lotus flowers in pairs, for the carving on the lintel is of the nature of picture-writing.

Elsewhere it is remarked that although a bird's-eye perspective of an Egyptian house could easily be made, "to express aright the architectural character of the buildings so studied and so sketched is beyond any artist's power. So far as present observation goes, there is no attainable knowledge of the architectural treatment of the Egyptian dwellings." The work of the military engineer in Egypt has not survived. We are therefore dependent mainly upon the temples for the display of their powers in architecture. Photographers have become more enterprising, and are not content with general views. Many details of parts of Egyptian buildings which ordinary travellers rarely see are introduced. The statue of King KHAFA and the head of Queen TAYA (both from the Cairo Museum) are by themselves enough to disprove the old theory of the priests laying down certain proportions for every figure, which painters and sculptors were compelled to follow. Both are vigorous examples of portraiture.

In treating of the architecture of Chaldea and Syria no attempt is made to trace a connection with Egypt. In fact, Mr. STURGIS generally avoids the investigation of claims of indebtedness. It is now impossible to speak with certainty about the forms of the buildings, and the restorations of PERROT and CHÉPIEZ are relied on. Some examples of sculpture from the Louvre are

illustrated, but a more suggestive series of Assyrian art is in the British Museum. French authors have also inspired the greater part of the chapter on Persian architecture. For the architecture of Syria and Phœnicia the books of some English travellers are utilised. A tomb with two lionesses in high relief is suggestive of the Mycenæan Lion's Gate. If Syria is disappointing in its architecture, it is pointed out that it was long a battlefield for various races, and destruction of buildings was therefore inevitable. Mr. STURGIS says:—

No part of the whole field can be said to be so far known to us that the "history" of architecture can include it. Of Phœnician art we have nothing but an apparent trace of rock-cut buildings on the coast and of two or three minute shrines; and the subject has to be studied in the islands of the Mediterranean and in Carthage and Utica, with their neighbouring villages—a region so thoroughly rebuilt by the Roman colonists that research in this direction is made particularly difficult. Of the Hittites not one building has been identified. So with the other peoples and powers named above, it is not they to whom we can accredit any monument found in Asia Minor or Syria, or even of the islands of the sea. All the historian can do is to mention a monument, if one of the very few which have architectural interest, and to state that a controversy is raging about its probable associations, ethnic and chronological.

History has been compared to an old almanac, and one of the advantages of Mr. STURGIS's treatment is that the reader can realise how much was blotted out in the course of time. Architecture was not always respected. In commencing his chapters on the art in Greece the absence of any basis for the precise fixing of dates has also to be pointed out. Many readers will probably be surprised when they are told that the South Sea Islanders were more skilled in wood-carving than the Greeks at one time, for "the carver of a paddle in the Solomon Islands or in New Caledonia reached a degree of artistic skill in the arrangement of his triangles, and his little sunken squares with ridges crossing them, left in the solid wood, which the early Greek does not seem to have thought of or cared for." Mr. STURGIS likewise maintains that Greek architects never developed architectural sculpture into a varied or very effectual system. At the time when figure sculpture had attained perfection the architectural ornament, palmettes, frets, egg-and-dart were limited. Nothing, in fact, is extenuated in respect of the shortcomings of the early Greek builders. The progress of temple construction is followed, as exemplified not only in Athens but elsewhere. On the disputed subject of the lighting of temples, Mr. STURGIS has the following remarks:—

The main reason for the demand which so many students make for a roof light is the importance and beauty of the temple-statue within, the value and charm of the dedicated offerings, or many of them, and the probability that the interior of a noble structure would itself be an interesting piece of architecture. Because of all these things, it is said, there must have been daylight. On the other hand, there is to be considered the amount of light which would be received by reflection from the floor and walls, when the great doors were open, under the sunny sky of Greece or Sicily, and with it is to be considered that indifference to bright daylight which travellers from the north find everywhere in Mediterranean lands. A dealer in fine carved furniture, delicate stuffs, precious church embroideries and the like, in a city of Provence or of Southern Italy, will live and attend to his business in a series of rooms so dark that the visitor cannot, even after ten minutes' stay, discover what he wishes to examine; and the dealer never thinks of the importance to himself and to his goods, even when they are fine, of bringing them out into full daylight. In like manner the sombre interiors of the Japanese temples have often been described, and the absolutely dark interiors of the Egyptian holy places behind the great hypostyle hall have been considered in Book I. of this work. It is partly because of this darkness that polychromatic decoration is used in such interiors. It has been pointed out by writers on Japanese art how successful is the colouring of the statuary—the colossal temple figures with gilded teeth and inset eyes of some gem, to enable their form to be seen in the semi-darkness under the roof; and the puzzle to

moderns of the painting of the Egyptian tombs remain emphasise the great importance laid upon such treatment with colour. No window is known to exist in any building of the great time, nor, indeed, during the independent existence of Greece, and to imagine a series of clerestory windows arranged something like dormer windows on a roof is to make a very bold assumption.

Excellent as they were as masons, the Greeks do not appear to have been skilful carpenters. Apparently they were ignorant of triangular framing for timber roofs. But Mr. STURGIS believes that the Ionic capital was derived from a wooden beam. As regards sculpture, he suggests that the noble figures which adorn the pediment of the Parthenon would have become more suited to their purpose as architectural decorations if a better provision had been made for supporting them. For anyone who wishes to be able to decide on the subject he advises six weeks of study in the museums of Athens, which he considers to be the finest school of sculpture in the world. Etruscan buildings are treated in a chapter on the Italian peoples before Imperial Roman control. Roman buildings are classed as arched buildings and columnar buildings. There are chapters on massive construction; plan and disposition of large buildings; plan and disposition of small buildings, and surface decoration.

"The History of Architecture," by Mr. STURGIS somehow suggests THIERRY's "Récits des Temps Mérovingiens." The Frenchman found there were no materials available for a continuous history, and therefore endeavoured by a series of remarkable narratives or episodes which could be accepted as true to suggest the character of a remote time, allowing the reader to perform the unifying action. Each of Mr. STURGIS's chapters has a completeness which would qualify it to be a magazine article or a lecture, although it is not without relation to what precedes or follows. This arrangement enables the volume to be made more with less labour than would be required for the execution of a continuous work. Although printed in New York the style of execution adopted exactly corresponds with the admirable examples of typography with which Mr. BATSFORD is identified. The work therefore will become a fitting companion for volumes with which English architects are familiar.

THE AMERICAN INSTITUTE OF ARCHITECTS AND SIR ASTON WEBB, R.A.

A MEETING of the American Institute of Architects was held in the Corcoran Art Gallery at Washington, on January 8, for the purpose of awarding the first gold medal to Sir Aston Webb, R.A. The president, Mr. Frank Miles Day, delivered the following address:—

Sir Aston Webb, Members of the American Institute of Architects, ladies and gentlemen,—The American Institute of Architects establishes upon this, the fiftieth anniversary of its foundation, a medal, the intention of which is to mark distinguished achievement in architecture wherever attained. To you, Sir Aston Webb, it will be our privilege to-night to give this medal, and we are gathered here to signalise not merely by that token, but by our presence, the admiration that we feel for your works and the respect that we attach to your career.

That this medal should first be given to an Englishman needs little explanation. A reasonable modesty might well constrain us to look beyond our own borders, and it is but natural that our thoughts should centre on that land which, more than with any other, we are united by ties of race and thought. We cannot escape from our indebtedness to that land, for of how large an import are the institutions that came to us from it. The principles of liberty, civil and religious; the foundation of our law of speech itself; all these and countless other gifts received from forefathers who were both yours and ours. But this, of little meaning as it is, would be little pertinent; to-night were it not that, among those gifts, our early forefathers brought the wholesome tradition of your native art of building; and as each wave of immigration reached our shores from yours, it brought with it a larger knowledge of the art and a stronger impulse to build wisely and well.

ly we learned our lesson you would see, sir, could you visit such widely separated places as Newport, Annan, and Charleston, or could you follow the windings of the river James. You would find "Westover," "Homewood," or a dozen other mansions as convincing in their quiet dignity as "Raynham Hall" or "Groombridge Place," and churches, town halls, State houses expressing in the same admirable fashion the aspirations and the limitations of life in those early days.

And just as we then received from you the traditions of Sir Jones and Sir Christopher Wren, traditions that gave quality and character to our colonial buildings, so at a later time the Classical revival that swept over Europe reached directly from its English source, William Thornton, who signed "The Octagon," he who stamped a definite and noble character upon the nation's Capitol. Thornton, no less than his patron Thomas Jefferson, gained his knowledge of classic architecture from those studies of it in which your countrymen were pioneers.

But if in those days we saw our Classic art through British eyes, I fear that to-day, with ready access to the architecture of the world and with a leaven of men among us trained in foreign schools, we might forget an indebtedness of centuries, were it not that we are irresistibly drawn to your island by the splendid fabrics that adorn it, from Cornwall to Caithness. For, sir, all that is best in your art is ours, if we have but the skill to make it so. Majestic Durham, high above the river Wear; the tree-emboweredaddon, with its terraces and stately gardens; the very obsequy by the Thames itself—innumerable treasures of a thousand years, all these are ours, if we but read them right.

But we have not failed to recognise that, glorious as is the past of your art in England, its present is full of vigour and charm. For many years this Institution has elected to honorary membership Englishmen, the mere mention of whose names calls up the vision of many a noble edifice and many a service to the cause of art. To name only the dead—Sir Charles Barry, Scott, Penrose, Street, Cockerell, Burgess, Ruskin. But among the living, how many are there whose names are dear to us, with whom you have the privilege of an intimate friendship—Ernest George, Phené Spiers, John Belcher, the venerable Norman Shaw, whose laurels are yet green, Bodley, whose perennial youth justifies him in Washington commencing even a cathedral.

It is from among men such as these that we have chosen you, sir, a younger but no less distinguished man, to confer upon you an honour which we shall perhaps not frequently award; and therefore, and because an ancient custom sanctions it, I am to recount in good set terms the reasons that have moved us to choose you as our medallist.

Matthew Arnold's dictum, that not only is good work needed to put a poet in a secure place, but a great body of good work, is no less true of other arts than it is of poetry. On the score of amplitude, your achievement lacks nothing, for no architect in England, save Sir Christopher himself, has been entrusted with the conduct of so many and such vast works. Whether they be houses, churches, courts of law, schools, museums, colleges, government offices or universities, I can name not a tithe of them. Yet, perforce, I must speak of some of them, and of these I name first the Victoria Courts, in Birmingham, the model of many similar buildings, and next the new buildings for Christ's Hospital, one of the largest groups of school buildings in the world, yet clearly conceived and treated with a charm that cannot fail to leave an imperishable imprint on the lives of its students. But these were years ago. Just now, in the Metropolis itself, you bring to completion the great buildings of the Royal College of Science, no less admirable for the way in which they solve a difficult technical problem than for that in which, without losing their individuality, they have been brought into harmony with a structure utterly different in purpose and conception, their opposite neighbour, the Imperial Institute.

Did time serve, I should wish to say more than a word upon those vast additions to the Victoria and Albert Museum, South Kensington, upon which you have been engaged these fifteen years, and in which we may hope shortly to see installed the noble collections which they are intended to shelter and to dignify.

Through your hands also the British nation is giving to the world an example of municipal improvement upon a vast scale and under circumstances the most fortunate. I mean the treatment of the grounds about the National Monument to Queen Victoria in front of Buckingham Palace, and the planning of the Mall and the "Processional Way"

leading from the monument to Charing Cross. Although progress with an undertaking of this size is necessarily slow, yet perhaps you will have it finished before we, in our capital city, have brought back to its original simplicity the much-perversed plan of L'Enfant and of Washington.

Not the less interesting, because it deals in a prosaic age with the world's most splendid spectacle, is the arrangement upon which you are now at work for the site of the "durbars" at Delhi.

Of these and many others of your works all may tomorrow gain an idea from the collection of illustrations of them which are hung in the Institute's house, the Octagon.

But in the midst of these large affairs you have not neglected to perform a labour of love in the restoration of ancient edifices, as at the fine old Norman church of St. Bartholomew the Great, the oldest church in London, which for well-nigh thirty years has been within your charge, and which you have rescued from neglect and ruin and wisely rehabilitated.

Nor have you ever failed to discharge those burdensome duties which every leader owes to the rank and file of his profession. On how many committees, in how many offices you have advanced their interests, it boots not to say. From among these let me note only the Presidency of the Royal Institute of British Architects—that Institute that we are proud to regard as the model and prototype of our own—and the Chairmanship of the Board of Architectural Education, that is so successfully unifying and improving the training of architects in the United Kingdom.

That your talents have not been unrecognised by your countrymen is shown by the volume of your works, by the honour of knighthood conferred upon you by the King, and, most of all, by your election as a Royal Academician.

Thoreau exclaims, "How admirably the artist is made to accomplish his self-culture by devotion to his art," and in you we see that it is not only nature but devotion to your art that has endowed you with "the intellectual versatility and refinement, the felicity of temperament" which we recognise alike in you and in the work that you have done.

And now, sir, because you have these qualities, and because, for a lifetime, you have dedicated them with signal success to the service of your profession, the American Institute of Architects confers upon you its "medal for distinguished achievement."

Reply of Sir Aston Webb.

Mr. President, Mr. Howard, ladies and gentlemen and Members of the American Institute of Architects,—I am afraid that no words of mine can possibly express the high appreciation that I feel that this Institute should have seen fit to bestow this gold medal of yours upon the architects of England through so humble a representative of that great profession as myself. Sir, any little modesty that I may have had, I am afraid must have entirely vanished as I sat hearing your far too kind remarks upon myself and what I have done. I thank you sincerely, and I must ask the audience to take off some of it.

I have come over here personally to say "Thank you," in the sincerest and the directest and the simplest way I can. And to assure you that all architects on the other side of the water will deeply appreciate the fact that on this, the jubilee day of your Institute, and the institution of this gold medal, you should send it over to the other side. Nothing, I am quite sure, in speaking for my brother architects, would they appreciate more than that, and I venture to think that it must do a great deal to strengthen the good feeling and friendship which I am glad to think already exists between the architects of both countries. Strengthened it already has been by the delightful personal intercourse that many of us had the opportunity of having during the International Congress which took place in London last summer.

As some slight indication of that good feeling, I have received this morning—before it was light—a cable from London from the Secretary of the Royal Institute of British Architects, asking me to make an announcement of the fact that at their meeting which they held last night they elected, subject to their acceptance of the election, three new honorary corresponding members of our body. Those three members I hope you may be interested to hear they have elected are your president, Mr. Frank Miles Day; your vice-president, Mr. Cass Gilbert; and your past president and almost father, I believe, of the Institute, Mr. George B. Post. We shall be very proud if these three gentlemen accept that election, and become one of us. As honorary member of the body we have already the honour of having Mr. McKim as one.

It adds greatly to my pleasure to receive the medal from an architect so eminent as yourself, one whom, if I may so say, has done such refined and distinguished work, much of which I have had the pleasure the last few days of seeing and admiring.

It has always been one of my happiest recollections that it fell to my lot to have the privilege to hand our medal to Mr. McKim. He came over personally to receive it, and I need hardly tell you that directly he arrived he entered into our hearts and affections, and has remained there ever since.

There is very much to an Englishman, landing here for the first time, that is very familiar to him. One does not feel at all in a strange land. He meets also, of course, a great deal that is not so familiar—that is another of the charms of coming over here. And as I walked about the streets of Philadelphia and New York I have had constantly running in my mind the words of Jean Ingelow, who was herself the sister of a well-known architect and a great friend of mine, when she said:—

It is not likeness only charms the sense,
It is not difference only sets the mind aglow;
It is the likeness in the difference,
Familiar language spoken in the snow.

As one who has spent only a few days in your country, I am sure you will not expect me, and I feel it would be the greatest presumption on my part, to express any opinion on the splendid architectural achievements I have seen in Washington, Philadelphia and New York. But I have noticed how great a hold architecture seems to have on the heart and imagination of the people here—not of architects only, but of the people generally; and I was very much prepared for that by a remark that Mr. Post made when he was speaking at the Guildhall, in London, when he said that fifty years ago in America architects and their work were not very much considered, but at the present day the position of both the practitioner and the art has been greatly, very greatly, improved. That seems to be one of the most hopeful signs for architecture in any country, that the people take a real and living interest in it. It does not seem to me to be at all wonderful, when one looks about and sees the wonderful problems that architects have to solve.

Take New York, for instance: there appears to be a terrific problem being solved there at a terrific speed which takes a poor English architect's breath away. To see the lower part of New York being practically rebuilt with new buildings some five or seven times taller than the buildings that stood on the site before. At present the work is only half accomplished, and it is difficult to judge of the ultimate effects. For the moment we see mainly the unfinished side of these huge structures, and there is naturally a sort of gappiness and want of scale in the whole city which will disappear when the streets are filled with these buildings. And, for myself, it seems to me—as far as a tourist is able to judge—that the proportion of these streets will finally assimilate on a gigantic scale very much to the streets of some Italian town, such as Genoa or Florence. These streets will have the great overhanging cornices apparently almost meeting across the road, and it does not surprise me to find that these streets have already attracted the pencil of artists, such as Mr. Pennell and Mr. Cooper, and I imagine before long they will attract the pen of the poet. The busy traffic of the streets and the idea of the quiet thinker in the top storey really seems to me a suggestive and a very impressive thing. I am quite serious. I felt this very much the other day, when I was taken out of a very crowded and unusually busy street and shot up into the air—I do not know how many storeys—and found myself in the calm artistic surroundings of Mr. Cass Gilbert's rooms, in a pure and tranquil air, and forgot all about the noise and bustle below. Just as I was leaving, some papers published illustrations of buildings twice the height of the highest skyscraper that is in New York. When these are up I imagine the present monsters will be reduced to pigmies and all the scale retired again, and what will happen then, I am glad to say, it is not for me to forecast.

The problem of the proper control of the expansion going on in our large cities seems the same in both countries. The abnormal growth in many of our large cities is the same as in your own. We feel—I don't know if you feel it so—that this expansion ought to be controlled by certain conditions, which should include open spaces for air and recreation, and also sites for public buildings, churches, &c. The present development of many of our cities at any rate is, I am afraid, along the lines indicated by the Bishop of

Birmingham, who said the other day:—"We walk through miles and miles of streets in our big cities without open spaces, without anything except what Dickens called 'an uninterrupted view over the way.'"

We want the whole mass of our cities to be organised, planned and laid out, but instead of that our cities grow in the will of the jerry builder—I don't know if you have them here—orderless, shapeless, without method, because there is no one to plan and forecast, to give the city dignity, space and order, nothing to make it worthy to be called a city.

Over here, I believe, you are taking this matter seriously in hand, and your Institute is often consulted in such matters. I am glad to say that is also becoming a fact with us, that the Government and public bodies do to some extent consult us in these matters. And we are making some small progress. For instance, Regent Street and the Quadrant had to be rebuilt, owing to the leases falling through, and the design was submitted to a small committee of architects, with the final result that the design is now in the capable and artistic hands of Mr. Norman Shaw. You of course, have an outstanding example of what may be done for architecture in the plans proposed with such extraordinary ability by the Park Commission for the improvement of this already beautiful Capitol of yours. The details of this great scheme are already very familiar to us in England, and we look forward to its full completion and to seeing Washington one of the beauty spots and wonders of the world. I hope you will agree that the proper placing of our public buildings is as important as the design itself. Wren, in his time, complained that our public buildings were nearly all seen sideways. That is the same now. It is quite an exception for any of our large public buildings to be really handsomely approached. You, of course, have a magnificent example of the proper placing of a building in the Capitol here, and in many other cases. We, I am sorry to say, have very few. The French, of course, are the masters of the work of arranging public buildings, and we all know how the Opera House in Paris gains by the splendid Avenue de l'Opéra, and how the Avenue de l'Opéra is improved by the Opera House at the end of it. With us it seems to be thought that for the purpose of traffic no street must ever be ended, going on for ever, and I must confess I have seen streets on this side of the water which have the same tendency. I venture to think that among the public duties of the several institutes of architects is to educate the people that in the laying out of cities there are other matters to be considered than traffic and sewerage, and that the placing of buildings at the ends of vistas is one of the matters that ought to have their consideration. A vista, in my opinion, ought to be closed, and closed in good time.

In architectural matters—and I hope I am not too technical, but this is the only opportunity I shall have of talking on matters architectural—the most important is architectural education. I think the Convention has had a most interesting and important report on that matter just brought before it. We ourselves are going through a sort of revolution quietly in the matter of architectural education. All our young men hitherto have gone to an architect's office for three or four years and been apprenticed. Now they go to school for two years and afterwards to an architect's office. We hope to teach systematically what can be taught systematically, and afterwards put them to work in an architect's office. We hope to substitute for the dry study of old work through dates and comparison of dates—as introduced by Rickman and others—the more important comparison of the whole structure by plans and sections and the balance of weights and thrusts. We have started a Board of Architectural Education, which your President has mentioned, with a view to co-ordinating the work of the schools. I have only touched on this because it is a matter of deep and abiding interest, whether in your country or in ours. For we must remember that the young men we are educating will follow us, and we shall soon have to consider them as our equals, possibly as our superiors, and perhaps stand aside to see them pass us, and we must recognise education to be the greatest influence on our art.

By encouraging the study of motives rather than the history of architectural design, we hope to bring before the mind of the student that our art is creative rather than imitative, and that though looking backward is informing and delightful, looking forward is more hopeful and stimulating still. The last century was spent by us at any rate in analysis and criticism of what had already been done, the present century may be spent in showing there are

resources that will clothe the multifarious requirements of the present day in reasonableness and beauty expressive of our times.

Mr. President, ladies and gentlemen, the memory of this evening will remain with me all my life. I shall take the medal home and keep it amongst my most treasured possessions, and hand it down to my children, who, I am glad to say, are architects too, and will therefore appreciate it. And when I look at it, as I often shall, it will remind me—though no reminder will be needful—of your wonderful country, your splendid architecture and your boundless generosity and hospitality which you so lavishly bestow on my countrymen and have extended to me on this occasion.

NORTH AND SOUTH IN ART.

A LECTURE was delivered last week by Sir William Armstrong in Dublin on "North and South in Art." The lecturer observed that by the North and South he meant the North and South of Europe; properly speaking the Latin races versus the Germanic. It might be said, however, that the word against was out of place, and that the phrase should have been "North and South;" but the inspiring principle of Latin art was opposed to that of Teutonic art. In some cases the distinction was not very broad. Speaking broadly, Latin art was sympathetic, Teutonic art was analytic. The Latin employed his subject in the making of new creations, of new unities and harmonies. He was not interested in his subject so much for its own sake as for the facility with which it lent itself to the expression of his own emotions and opinions—in short, of his own personality. The Teuton, on the other hand, was fascinated by his subject. He loved it for its own sake. His delight was to peer into its constitution and to say as much about it to his public as that medium in which he worked allowed. With the Latin the emotional side prevailed, with the Teuton the scientific. It was in the emotional element that art rested. Science alone could not supply those selections and preferences on which unity of a work of art alone depended. It was to the fine development among the Southern races of that emotional element that they owed their superiority in art over their Northern rivals. But the arts of the Western and North-Western countries of Europe, owing to the fact that they are inhabited by mixed races, showed various combinations of the principles of the North and South. Sometimes the combination was very intimate indeed, and resulted in a happy marriage between the two. This prevailed chiefly in France and the Low Countries. The British Isles afforded the best example of the two principles alternately taking command. The Germanic was prominent in the sixteenth century, but in the eighteenth the formative arts became almost completely Latin. One hundred years later the presentation of Latin art had fallen into the hands of inferior men, and its principle became discredited. A demand was made for more objective truth. Painters were sent back to the scientific study of facts, to humility before their models, and they then had the pre-Raphaelite movement. By the aid of lantern slides portrayals of Latin and German masterpieces were thrown on to a screen, and interesting, though brief, accounts were given of the pictures and their creators. Specimens were also given of the fate which befell the two principles amongst these two nations, which owed a certain duty to both. The lecturer then proceeded to deal with Gothic architecture, which was born in North-Western Europe. Its parentage was claimed by both France and England. The fact was perhaps that the actual birth occurred in England at Lincoln, but that France was the nursery of the Gothic style. Gothic art became more warm and flexible according as it departed from Germany and was utilised in the Low Countries. Holman Hunt and Madox Brown adhered to the Germanic style, whilst Millais and Rossetti, of Latin extraction, deserted it for the Southern school. The lecturer thought that the great artist was of a higher type than the great scientist. Newton, great as he was, had to take a lower place than Shakespeare and Michel Angelo. It was a greater feat to master the facts of nature and then use them for the purposes of a new creation of an organised nicety, in which some of the qualities of the creator himself reappeared, than to be content with knowing and handing on the knowledge to those who came after. The battle often lay between knowledge for its own sake and art for its own sake, and in that case many would prefer the latter, for knowledge was amplified by art, while art was scarcely amplified by knowledge.

VENTILATION OF LONDON.

A PAPER was read by Mr. A. A. Hudson at the meeting of the Surveyors' Institution on Monday. He said the streets, like houses, depended for ventilation upon diffusion, but chiefly upon the action of wind, which was caused by the unequal weight of air at different temperatures. Speaking generally, the large open squares of London were well ventilated, but the smaller squares in back streets were very badly ventilated. The best natural ventilator of London was the river Thames, owing to the water changing its temperature less quickly than the air, which caused currents of air, and to the river being tidal. The parks were also most important, the dew on the grass, the water of the lakes, and the large areas causing draughts. The Thames and open surfaces ventilated, however, little more than the houses fronting them. The openings of the streets leading from them were generally so small that the air was not driven far down them. Eddy-winds were also means of ventilation, and these were caused by the unequal heights of buildings. Flat-pitched roofs and streets with long rows of more or less level-topped houses created very little eddies, and were therefore bad for ventilation. Buildings or gables, steep-pitched roofs and irregular skyline were better for ventilation than the square blocks of houses produced for cheapness by the speculative builder. The much-abused sky-signs might not only be used for advertising, but for the purpose of producing eddies. The winter ventilation of towns was better than the summer ventilation, because winds were stronger and more frequent, and currents of air were caused by the heat of the houses. In summer-time the streets might be flushed more frequently as a means of producing currents of air by changing the temperature of the pavement. It was pointed out that the sewers were ventilated directly into the streets, although they were trapped. While the streets were undermined by elongated cesspools supposed to be sealed, there was nothing to prevent sewer-gas discharging into the streets in time of suddenly-diminished atmospheric pressure. Possibly some improvement might be effected by cleansing and deodorising streets and refuse, and by ventilating the sewers by tall shafts and flushing them. But at present the state of some streets was deplorable, especially in hot weather. Wood pavements had been laid down to deaden sound, but they appeared to be injurious to health by breeding bacteria, and affected the eyes and throat by the dust they threw off. But beyond this pollution there was the deterioration of the air and the increasing use made of it by motors and all kinds of machinery. The action of motors in stirring up germ-laden dust was a very serious matter. Fresh air must be found somewhere until liquid air had become cheap enough for ordinary use, and if it could not be obtained from the streets, it could only be obtained from the back and the top of the houses. Street noises prevented to some extent the opening of windows facing streets, and if it should be necessary in the future to design such windows to obtain light only, the ventilation would chiefly have to be derived from shafts running down the middle of the houses. Mr. Hudson thought it would also be necessary to cause ventilation in many more cases by mechanical means. Spaces at the backs of houses should not be permitted to be closed in by houses on all sides. Inasmuch as inequality of height of buildings produced better ventilation, he suggested that those in authority who had the control of high buildings should sanction and encourage them in selected places. He referred to the bad ventilation of basements of shops, and urged that it would not be unreasonable to legislate that the air should be kept pure, according to Government tests. Mechanical means would have to be adopted in many cases, and, speaking generally, mechanical ventilation was far better than natural ventilation, because the latter did not insure equally distributed purity.

The Chairman of the London County Council, as well as the official heads of the municipalities of Paris, Berlin, Vienna, Rome and Athens, were invited by the municipality of Alexandria in May last to submit the name of a candidate for the post of engineer to that city. On the recommendation of Mr. Maurice Fitzmaurice, C.M.G., the Council's chief engineer, the name of Mr. D. E. Lloyd Davies was submitted from London. The municipality of Alexandria, at a meeting held on November 28 to consider the applications of the nominees of the different capitals of Europe, decided to confer the appointment on Mr. Lloyd Davies.

NOTES AND COMMENTS.

REAR-ADMIRAL RABY, who died on Wednesday morning at Southsea, had an eventful history. The first work on which he was engaged was in 1842, when as a lad he aided in superintending the removal of the Xanthian marbles which are now in the British Museum. Mr. CHARLES FELLOWS, having visited Lycia in 1838, was so impressed with the remarkable character of the remains, that he induced the Government to send a vessel to remove them. Among the works obtained is the Harpy Tomb. It consisted of a square shaft in one block, weighing about 80 tons; its height 17 feet, placed upon a base rising on one side 6 feet from the ground, on the other but little above the present level of the earth. Around the sides of the top of the shaft were ranged bas-reliefs in white marble, about 3 feet 3 inches high. Upon these rested a capstone, apparently a series of stones, one projecting over the other; but these are cut in one block, probably 15 or 20 tons in weight. It was believed that the tomb was used in the early ages of Christianity by some anchorite. Still more interesting was the Horse Tomb, in which was buried a satrap named PAIAFA. It resembles a wooden house, the upper part suggesting a Gothic vault. The reliefs represent a combat of warriors on foot and horseback. Many other remains are also interesting, and Mr. FELLOWS was well deserving of the knighthood he received for his energy in securing them for the British Museum.

THE disposal of the infirmary site in Manchester has not yet been settled. At last week's meeting of the City Council it was proposed "That the Royal Infirmary site be appropriated for the purposes of the libraries committee and the art gallery committee, subject to the widening of Parker Street and the provision of an adequate open space, and that it be referred to the special committee to obtain plans and to formulate a scheme for submission to and approval by this Council." That arrangement has been for a long time under consideration. But in Manchester, as in other parts of the kingdom, taxation is an onerous burden, and there were fears expressed that with so fine a site there would be a temptation to expend large sums on the proposed buildings. An amendment was therefore brought forward to the following effect:—"That it be an instruction to the infirmary site committee that, in inviting designs and plans for the new municipal art gallery and reference library to be erected on the infirmary site, no proposals involving an outlay greater than 250,000*l.* shall be entered into." The decision of the Council was adjourned for a fortnight.

A CONFERENCE is to take place on the 22nd inst. between representatives of the Manchester Chamber of Commerce and officials of the Board of Trade respecting the proposed Bill relating to copyright in design. The report of the Chamber also states that a committee of the Board of Trade has been appointed to inquire and report (1) as to the nature and extent of the benefit accruing to British arts, industries and trade from the participation of this country in great international exhibitions, and (2) whether the results warrant His Majesty's Government in financially supporting such exhibitions in the future. If this question be decided in the affirmative the committee are further to inquire what steps ought to be taken to secure the utmost advantages from the expenditure of public moneys on this object. The various sections of the Chamber had been asked by the Board to report on the subject, and the preponderance of opinion was in favour of the continuance of the participation and support of the Government. The Engineering and Metals Section considered that such support should be accorded on at least the same scale as heretofore. They recommended that greater efficiency as regards the knowledge of the language of the country in which the exhibition is held

and a higher degree of competence in commercial affairs should be required of the British official representatives having the management of the business of the spot. The Chamber adopted these views, and representations will be made to the Board of Trade.

ILLUSTRATIONS.

CATHEDRAL SERIES.—CARLISLE: THE EAST WINDOW.

FOR many visitors to Carlisle Cathedral the east window is the most attractive feature. The late R. W. BILLINGS had the patience to scrutinise the tracery, and found that the curves were struck from 263 centres. There are eighty-six pieces, and the majority of them could be singly removed without any risk to the arrangement. From the armorial bearing it would appear that the tracery belongs to the latter quarter of the fourteenth century, although the arches and shafts may belong to the beginning of that century. The greater definiteness of the glass forming the higher lower lights as shown by the illustration suggests a modern character. It was executed less than half a century ago. The old glass amidst the tracery is supposed to represent the Last Judgment.

THE NEW COUNCIL SCHOOLS, BEXHILL-ON-SEA.

THE new buildings erected for the local educational authority are placed at the corner of the Down on a site of one acre, which has cost 1,000*l.* The plan by Mr. BURKE DOWNING, were selected in competition. Accommodation is at present provided for 200 girls and 200 infants, but a larger scheme will be carried out, as shown on plan. The infants' entrance doorway, with its heads of cherubs carved by Mr. F. B. HITCH, will then appear between two large blocks. The materials employed are bright red brick and white stone for the walls, purple bricks for plinths, rough-cast for the tw gable ends, and tiles for the pitched roofs. The central hall is about 74 feet long by 25 feet wide and 23 feet high, and has a gallery at one end. The class rooms (each about 25 feet by 22 feet by 14 feet 6 inches high) all open directly out of this hall, as does also the head-mistress's room. The stairs leading to the gallery lead also to a large room for the assistant teachers which is furnished with a range. This room has been placed so that its windows overlook the playground for convenience of supervision, and one window also looks into the babies' room. The building is heated by a warm-air system, in connection with which a system of ventilation, supplementary to the natural ventilation of the windows, has been arranged. The heating chamber has been placed so that it will be centrally situated between the two blocks. The building is lit by electricity supplied from the borough mains. The present portion has occupied ten months in building, and, apart from some additional works ordered by the committee as the building proceeded, an expenditure of about 20*l.* only beyond the contract sum has been incurred. Builders have done their work remarkably well. The general contractor were Messrs. R. COOK & SONS, of Crawley. Mr. F. B. SELF was clerk of the works. The whole of the sanitary fittings were supplied by Mr. T. H. HARRIS, of Blackfriars Road; the heating system was installed by Mr. JOHN GRUNDY, the electric-light installation and fittings were provided by Mr. WILLIAM NEWTON, the wrought ironwork is by Mr. E. NORKETT, wood-block flooring by Messrs. ARTHUR JEFFRIES & Co., and lock and door furniture by GEO. WRAGGE, LTD.

ST. JUDE'S CHURCH, NEWCASTLE-ON-TYNE.

THIS church is built in brick with red Carlisle stonework and dressings. It cost 3,086*l.*, including vestries, heating and font, and tinted design lead glazing. It is planned at a cheap first cost, but arranged and designed for a further expenditure of fresco or mosaic decoration and a tower. The builder of the church is Mr. W. BASTON, of Newcastle, and the architect Mr. A. PLUMMER, F.R.I.B.A., of Newcastle.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. Walter Cave, vice-president, in the chair.

The following gentlemen were elected as members:—Messrs. J. L. Denman and V. S. Whitaker.

Mr. MERVYN E. MACARTNEY read a paper entitled

Regent Street.

He said:—I have taken the subject of my paper, "Regent Street," to mean the line of route from St. James's Park to Regent's Park, and since to have omitted Waterloo Place and Portland Place would have cut out two of the most interesting portions of the matter in hand, I will include them in our survey. I intend to divide my paper into three sections. Of these the first deals with the history of the site which it now occupies; the second with its laying out and construction by Nash and others, up to the lamentable year when the Hanover Chapel was destroyed; while the third embraces all the subsequent history of the street up to the present day, and hazards some guesses as to the future.

To begin with the top end of the street. What is now Park Crescent was pasture land, known as Duppersfield, long after Portland Place had been erected. It formed part of Marylebone Park, which extended southwards to Mortimer Street, and was portion of a royal manor belonging to Henry VIII. In his reign hunting in this manor was strictly preserved for royalty. The manor-house itself was situated nearly at the top of High Street, Marylebone. As you are doubtless aware, Marylebone should really be Marylebourne—i.e. the church of St. Mary-by-the-Burn, Tyburn. (This district of Tyburn was a large one, extending roughly from Tottenham Court Road to Paddington east and west, and from St. John's Wood to Oxford Street.) The origin of the name is somewhat curious. The district of Marylebone took its appellation in order to sever its connection with Tyburn, which had got into bad odour owing to the executions held at Tyburn gallows, which were situated at the south end of Edgware Road. In some maps of the Portland estate the region of Portland Place is set out differently from its present condition. The site of the Langham Hotel is put down as Queen Anne's Square, and from it radiate two streets north-west and north-east, called respectively Langham Street and Portland Street. This scheme was abandoned, and Lord Foley bought the Langham Hotel site with the proviso that nothing should be built to interrupt his view to the north. Of the consequences of this we shall have more to say later.

But to come to our street itself.

Swallow Street.

Information about the first period is meagre in the extreme; indeed, we have to rely almost entirely on such old prints as have come down to us. These show us a very different scene to the present wide and populous thoroughfare. We see a long, ugly and irregular "street"—if that be not too grand a name with which to dignify it—frequented by people of more than doubtful reputation. Amongst these were counted even highwaymen, who had a noted house-of-call in a certain livery stable somewhere in the street. Lord Macaulay tells us that in King Charles II.'s reign "he who then rambled to what is now the gayest and most crowded part of Regent Street found himself in a solitude, and was sometimes so fortunate as to have a shot at a woodcock." At this time, it must be remembered, Oxford Street was a country road running between high hedges. This is practically all the information we have concerning the early history of Regent Street. It takes us back no further than the year 1600; but, indeed, the subject of the paper is comparatively a modern road, when we consider that Oxford Street, Piccadilly, and the Mall can trace their history back almost to Roman times.

The Period of Construction.

Before detailing the planning and reconstruction of Regent Street itself, we must tell of the building of Carlton House. Although this may seem at first sight to be somewhat irrelevant, it will be found afterwards to be most eminently to the point: for, had it not been for the existence of Carlton House and Regent's Park as well, Regent Street might never have come into existence. Carlton House, then, was built for Lord Carlton in 1709. On his death, it went to his nephew, Richard Boyle, Earl of Burlington, the architect, who, in 1732, gave it to his mother, the Countess Dowager of Burlington, who in her turn—and in the same

year—sold it to Frederick, Prince of Wales, the father of George III. The house was originally of red brick, in the style of Queen Anne; but Prince Frederick, on taking possession of it, fronted it with stone. Sir Robert Taylor is said to have been the architect. (In 1734 Flitcroft, or some other, drew out a plan for its improvement.) Attached to the house were large gardens, said by Walpole to have been laid out in imitation of Pope's gardens at Twickenham, which contained, amongst other objects of interest, a cascade designed by Kent, and a large grove of trees holding a rookery, which was not deserted by the rooks till 1827. The house stood opposite Waterloo Place, looking north, and the forecourt was later divided from Pall Mall by a long range of columns, supporting nothing. Hence the well-known lines:—"Care colonne, che state qua? Non sappiamo in verità," which mean literally, "My dear columns, what are you doing there?" Here the columns are supposed to answer, "We haven't the faintest idea." With reference to this colonnade, a witty remark of Lord North's is reported, though some claim it for Sheridan. It so happened that while the Prince of Wales's house had a row of pillars in front of it, York (now Dover) House, the residence of the Prince's brother, had a circular court. Lord North said:—"Then the Duke of York has been sent, as it would seem, to the Round House, and the Prince of Wales to the pillory." This house witnessed many extraordinary scenes. It saw in 1749 Frederick, Prince of Wales, hold secret conclave, and make full arrangements for what should occur on his father's death, even to the framing of a new Civil List. This Prince's death, in 1751, does not seem to have been any great loss to the community. In his lifetime he would go disguised to see bull-baiting, and he was a royal patron to fortune-tellers. He allowed Lady Archibald Hamilton to build herself apartments giving on to the garden of the house, so that he might visit her secretly.

It was this Prince who, in answer to the fulsome flatteries of Pope, the poet and satirist, expressed his surprise thus:—"I wonder that you who are so severe on kings should be so complimentary to me." "Oh, sir," said Pope, "that is because I like the lion before his claws are full grown." In 1783 Holland repaired and beautified the house for the Prince of Wales (who was afterwards George IV.). He added a portico with six Corinthian columns. His details he took from the Temple of Jupiter Stator at Rome. Above this was a frieze and a tympanum with the Prince's arms. In 1784, George, Prince of Wales, on two consecutive days celebrated banquets of the most gorgeous description to celebrate Fox's return for Westminster. This was, of course, in entire disregard for his father's wishes. The house was modernised in 1788, and again internally in 1815. In 1789 the Prince received at Carlton House a deputation offering him the Regency, which later on he accepted.

During this time the famous Beau Brummel was a constant frequenter of Carlton House; but he and the Prince fell out, and he ceased to visit there. Some time after the Prince invited the Beau to dinner once more. So overjoyed was Brummel at dining again with his old friend that he took a trifle too much wine—no great matter in those days; but the Prince turned to his neighbour and said in a voice audible throughout the room, "I think we had better order Mr. Brummel's carriage before he gets quite drunk." The story goes that the Prince acted so in revenge for an insult he had received at Brummel's hands. He was in the same room at some function with Brummel, when the latter passed by the Prince with a lady on his arm, who turned to her partner and asked, "George, who is your fat friend?" In George IV.'s time the poet Moore was a constant guest at Carlton House. He has left the following description of the Prince's breakfast-room during the height of the season:—

Methought the Prince in whisker'd state
Before me at his breakfast sat;
On one side lay unread petitions,
On t'other hints from five physicians;
Here tradesmen's bills, official papers,
Notes from "my lady," drams for vapours;
There plans for saddles, tea and toast,
Death-warrants and—*The Morning Post*.

In 1814, on the occasion of the visit of the allied sovereigns, the famous Nash designed a reception-room in the gardens of Carlton House. It had twenty-four sides and a curious roof, and was 120 feet in diameter. Afterwards it was given to Woolwich, and is now a museum for naval and military models. In "The Beauties of England and Wales" the writer describes, in

a tone of rapturous admiration, the splendours of Carlton House. There was a crimson drawing-room, a circular cupola-room, a throne room and a rose-satin drawing-room. From these descriptions it is evident that the interior of the house was of the most gorgeous description, but whether it was in the best of taste is very doubtful. This is particularly the case when he goes on to describe a "splendid" Gothic conservatory, which to me at least seems almost a contradiction in terms; this was designed by Thomas Hopper, after Henry VII.'s Chapel. Among other apartments was a suite on a lower floor, which was used for domestic purposes and familiar parties. These were designed by Nash, and consisted of a golden drawing-room, a "Gothic dining-room" and the above-mentioned "splendid" Gothic conservatory. In somewhat violent contrast to this uncritical admiration is the following extract from the "Tour of a Foreigner in England" (1825):—"Though the royal . . . palaces are among the most remarkable in London, they serve to show how little the dignity of the sovereign is respected in England in comparison with other countries of Europe. . . . There are in Paris many hotels preferable to Carlton House." The portico, which only served to conceal the house from Pall Mall, then comes in for severe criticism. As regards the other features of the exterior, they were apparently not very striking. The façade had a centre and two wings. It was rusticated and without pilasters. The entablature and balustrade concealed the roof from view. The whole of Carlton House was pulled down in 1828 to make room for the central opening of Waterloo Place. Some of the Corinthian columns from the colonnade were used in the portico of the National Gallery. Other columns were employed in the chapel at Buckingham Palace. The interior decorations were for the most part removed to the last-named place.

Regent's Park and Regent Street.

In July of the year 1793 the Treasury empowered Fordyce, who was then Surveyor-General, to offer a premium of 1,000*l.* for the best plan for building on the Marylebone estate. John Nash, who was the architect and surveyor to the Woods and Forests Commission, and also one of the architects attached to the Board of Works, submitted a plan, in which he was assisted by James Morgan, a former pupil, showing detached villas. There was also sent in a plan by Leverton & Chawner, of a more urban character, and also one by White. Nash's plans were approved. After this the Crown obtained an Act of Parliament and appointed a Commission to form a park in accordance with Nash's plans. Marylebone Park, as Regent's Park was then known, was begun in 1812. About the same time Park Crescent and Square and the adjoining streets were completed. At this time the Prince Regent conceived the notion of building a mansion for himself in the park, and desired some means of communication with Carlton House. This was the genesis of Regent Street. Nash was commissioned to lay it out, and in 1813 the work was actually taken in hand. In the construction Nash did not find his way entirely smooth, though in one particular he was certainly fortunate. When Lord Foley built Foley House in 1778, to the designs of James Wyatt, he had stipulated with the Duke of Portland, the ground landlord, that no other building should be erected to the north. Later on this prohibition considerably embarrassed the duke. But the Brothers Adam, the architects, cleverly evaded the difficulty by building Portland Place, on a most sumptuous scale, of the same width as Foley House.

It strikes me as strange that such fine mansions should have been erected on this spot at a time when the New Road had not been formed, and when Foley House blocked the south end of it (Duppensfield shut it in at the north end, so that it could only be approached by a roundabout route from Harley Street or Great Portland Street). Looking at the scheme as shown in contemporary plans, it does not seem a good speculation, but when Nash came on the scene all this was changed, for he made it the connection between his new street and Park Crescent. So far Nash had his street ready-made, but to continue he had to buy up Foley House and grounds. This cost him 70,000*l.* After this, through some disagreement with Sir James Langham, he was compelled to alter his plan of bringing his street straight over the site of Foley House, and constructed in its stead the present Langham Bend. The quadrant also grew out of a change of plan, owing to the erection of the County Fire Office by Robert Abraham in 1819. Nash himself designed the façade. The portion of the street up to Piccadilly was finished by 1817, and the whole practically complete in

1820. The total cost of the street, including the sewer, was 1,533,582*l.* 16*s.* 10*d.*

I will now describe to you the chief buildings of interest in the street, beginning at its northern end.

All Souls.

I have already mentioned Portland Place, Foley House, and the Langham Bend. Just at this bend still stands All Souls Church. This was built by Nash between the years 1822 and 1824. The tower and spire of his very original edifice seem almost detached from the rest of the church. It was thus placed by Nash in the centre line of the street in order to form a striking termination to the vista.

Argyll Rooms.

The first point of interest to which we come below Oxford Circus is the Argyll Rooms, or rather their site, for they exist no longer. They were built by Nash in 1816 for Joseph Welch. Afterwards they were turned into concert rooms, and became the most famous in London. They were used by the Philharmonic Society and many others for their concerts. In 1834 a fate befell them not uncommon to buildings used for such purposes; they were burned down.

Foubert's Academy.

Not far from the Argyll Rooms, and on the same side of the street, stood Foubert's riding academy. It was kept by a certain Major Foubert, who moved his academy there in Charles II.'s reign, from behind Leicester House, where it had previously stood. This riding school was patronised by the *élite* of society. Its name is still preserved in "Foubert's Passage."

Hanover Chapel.

Nearly opposite this stood, till quite lately, Hanover Chapel. It was built by Cockerell, R.A., in imitation of the Temple of Minerva Polias, at Priene, at a cost of 16,180*l.* Of the pillars of the portico Ruskin said:—"They look as if they were standing on a pile of pewter collecting plates." None the less, the general effect was undoubtedly fine, and of its destruction we may say, "'Tis true, 'tis pity, pity 'tis 'tis true." That extraordinary monstrosity, Regent House, now stands on its site.

Trinity Chapel.

In the reign of James II. a chapel on wheels was erected at the camp on Hounslow Heath, in which Mass was daily performed. At the Revolution the chapel was removed to a position not far from Conduit Street and reconstructed. In 1725, when Conduit Street was built, the present chapel of Trinity Church was erected on its south side. It has since been built in, and is invisible from the street. Another name for this chapel is the Chapel of Archbishop Tenison, who was its founder. It was conveyed to trustees, amongst whom was Sir Isaac Newton; and when Regent Street was constructed it was refronted. But in 1850, the endowment proving insufficient, the west end was cut off and converted into shops.

The Quadrant.

We next come to the famous quadrant. It originally had a colonnade of 270 cast-iron hollow pillars, 16 feet high, topped by a granite plinth. Of these columns, eight still remain across Air Street and Swallow Street. Above this again was a balustraded roof. In its palmy days the quadrant was the gayest and most crowded part of London, as the following extract will show:—"During the day this quadrant is one continued scene of amusement. The shopkeepers submit every article of necessity or luxury to the inspection of the public, and find ready customers amongst the multitudinous people who visit the place. But when Somnus has spread his mantle over its inhabitants, and the moon sheds her silvery rays on its edifice, contrasting its depth of shadow with the most refulgent brightness, when the stillness of death succeeds to almost confusion, the being who can behold it with indifference must be destitute of the finer feelings of human nature." Owing to the complaints of the shopkeepers the columns were removed in 1848, and a balcony was added to the principal floor by the architect Pennethorne. Nash was in a rather equivocal position in some of his dealings with the laying out of Regent Street, and more particularly with regard to the quadrant. He seems to have acted both as the Government surveyor of the new street and also to have dabbled as a private speculator in acquiring property to carry through the scheme. So far as I can discover, his hands were quite clean in the matter, but it seems rather strange conduct on the part of a public official, and I can hardly believe it would be tolerated at the present day. He undoubtedly mixed himself up

th the acquisition of land bought for the quadrant, and ent his fingers over the job. However we, with our modern notions, may regard his conduct in the matter, we must admit he showed himself a man of large ideas, who was prepared to carry them out, even at considerable personal risk. We may take the opportunity to mention here Nash's extensive use of stucco, which brought upon him that famous epigram beginning, "Augustus at Rome was for building renown'd," an epigram of which my hearers must be heartily sick, and so I will quote no more of it.

Piccadilly Hall.

Next we must say a few words about Piccadilly Circus, named after Piccadilly Hall. The derivation of the name is in dispute; formerly it was written Pickadilla. Some refer it to the seventeenth-century name for the hem of a garment, and say the house was so called because it was the outmost or skirt house of the suburbs in these parts. Others say it took name from this:—"One Higgins, a tailor, who built it, got most of his estate by Pickadilles, which in the last age were much worn in England." This, however, seems to be a pure myth, no such person as the tailor Higgins having ever apparently existed. Others again believe that the name relates to the position of the ground on which the place is built; that it is, in fact, a peaked hill for pickadil also meant a kind of stiff collar. This last derivation seems the most probable, as there are many Piccadillies in various parts of England, all situate on the tops of hills.

Nash's House.

Having passed the Circus, we reach Nash's own house, built to his own designs. Here he lived till his retirement. It was later turned into the Junior Constitutional Club's premises, when the original Constitutional Club left it for more commodious quarters. It was afterwards known as the Gallery of Illustration, from the panoramas there exhibited. Later, German Reed used it for his entertainments. It is now occupied by the "Coupé Co."

St. Philip's.

Nearly opposite this was St. Philip's Chapel. It was built after the designs of Sir William Chambers, by Repton, and was a copy of the choragic monument of Lysicrates at Athens. Owing to its position the altar was at the west end instead of at the east. It has since been destroyed.

Waterloo Place.

We are now in Waterloo Place and at our journey's end. It was designed by Nash, and is chiefly interesting by reason of its literary associations. At No. 13 used to house the establishment of Messrs. Taylor & Hessey, the publishers of "The London Magazine," in which appeared for the first time "The Essays of Elia" and the "Confessions of an English Opium-eater." A quotation may prove not uninteresting:—"It was then (circ. 1823) the contributors met once a month over an excellent dinner given by the firm and consulted and talked on literary matters together. Charles Lamb came to most of these dinners, always dressed in black (his 'snuff-coloured suit' having been dismissed for years), always kind and genial." Until the middle of 1890 No. 3 was occupied by Messrs. Rivington, the publishers.

The following verses of Hood refer to a somewhat earlier date:—

Thy first great trial in this mighty town
Was, if I rightly recollect, upon
That gentle hill which goeth
Down from the "Country" to the Palace [Carlton
House] gate,
And like a river, thanks to thee, now floweth
Past the Old Horticultural Society,
The chemist Cobb's, the house of Howell & James,
Where ladies play high shawl and satin games,
A little Hell of lace!
And past the Athenæum, made of late,
Severs a sweet variety
Of milliners and booksellers who grace
Waterloo Place,
Making division, the Muse fears and guesses,
'Twixt Mr. Rivington and Mr. Hessey's.
(THOMAS HOOD, Ode to Mr. MacAdam.)

Life of Nash.

Before proceeding to our concluding section, a brief life of Nash will not be out of place, because Nash was the originator and designer of our street. John Nash was born in 1752, most probably at Cardigan, in South Wales. As his parents were well-to-do, he was placed with Sir R.

Taylor, where he was a contemporary of Cockerell, Craig, Leach and others. On leaving Sir R. Taylor he went into retirement at Carmarthen for several years, but was induced by a visit of Cockerell to that place to renew his architectural career.

The following is a brief list of his principal works:— In 1797-9 he carried out alterations at Corsham House, in Wiltshire, for Paul C. Methuen, Esq. The north front of this house is Tudor Gothic. The cost of the alterations was 80,000*l.*, so they must have been of an extensive nature. The grounds were laid out by Repton, who afterwards claimed the whole design for himself and his son, who was then in Nash's office. In 1799 he designed Sundridge Park, Kent, in the Italian style, for Claude Scott, Esq. In 1803 he was commissioned to design a house for Lieut.-Col. Stewart. This house called Killymore Castle, co. Tyrone, cost 80,000*l.* In 1812 he redesigned Highgate archway, which, begun in 1811 as a tunnel 24 feet wide, had fallen in early in the year. On August 1, 1814, there were held grand displays in the three parks in commemoration of the general peace. There were fireworks, miniature naval battles on the Serpentine, and other like festivities. As his contribution Nash made a bridge and a Chinese pagoda at St. James's Park and a Temple of Concord in the Green Park, which had originally been suggested by Sir William Congreve. The bridge, although originally intended to remain for one night only, was afterwards strengthened by Mr. J. W. Hirst, and left as a permanent structure for several years.

It was at this time that Nash first came into contact with the Prince Regent, and gained his favour, the which secured for him his name and fortune. Thus it happened that when James Wyatt suddenly died Nash was given temporarily the post of Surveyor-General, by command of the Prince. For his patron Nash designed in 1814 the twenty-four sided pavilion in the gardens of Carlton House, which we have noticed above. In 1816-8, in collaboration with Repton, he altered and enlarged the Opera House in the Haymarket, and added an arcade and colonnade of cast-iron columns, which have since been removed. In July 1793 his design won the premium offered for the Marylebone Park. The only terraces not designed by Nash are Cornwall Terrace and Munster Terrace, which was not built till 1827. He designed Park Crescent and Square, Albany Street and the adjoining streets, the Park villages and the outer road of the Park. In 1813-6 Regent Street was designed and carried out, in 1816 he built Argyll Rooms, in 1819 the front of the County Fire Office and the Quadrant. In 1823 he built his own house in Regent Street, moving thither from Dover Street, where he had previously resided. For this house he employed painters in Rome to make copies of Raphael's pictures in the Vatican. To do this he got the Pope's special permit. He also combined into one uniform façade the façades of several shops. This practice was continued by subsequent architects. The years 1826-8 saw the construction of the United Service Club House, Pall Mall, and perhaps of Waterloo Place. In 1825 Parliament made a grant for the repairing and enlarging of Buckingham House for George IV. On the strength of this Buckingham Palace was built, although the grant permitted no such extensive an undertaking. Nash was the architect. The Marble Arch was originally in front of the palace, whence it was removed in 1826. It is of Carrara marble, and cost no less than 30,000*l.*

Windsor Castle was also altered by our architect, who was apparently in great favour at Court. When St. James's Park was laid out in 1828, Nash was employed; but this was his last work of importance, for shortly afterwards he retired to Cowes Castle (Isle of Wight), one of his own earlier designs. There he died in May 1835 in his eighty-third year. Contrary to expectation, he left but little property, though he must have made enormous sums by his profession. In his old age James Pennethorne, a relative, carried through his works for him. Among his pupils was John Adey Repton, and among his clerks Pugin, Foulon and Morgan. Considered as a builder, Nash showed his originality by his employment of stucco, the use of which he practically introduced, and of cast-iron columns, by which he anticipated the present enormous use of iron and steel in architecture. While if we regard him as an architect and artist, we must admit that if his details were poor his conceptions were at least grand and magnificent. But it is for his planning that he deserves particular commendation. I doubt if many of my audience are aware that a perpendicular let fall from the west end of Park Crescent would hit the south end of Park Lane. It is an excellent object

lesson, showing how to cut a series of parallel lines by a diagonal.

A similar problem was set when the Charing Cross Road had to be made. The contrast between the two is only too evident. Regent Street is an ordered and satisfactory lay-out. Charing Cross Road is a hopeless jumble. In many places it is difficult to pick it out from the other lines of traffic, whereas Regent Street never loses its identity. Why is this? The answer is simple. In the one case the line of the street was laid out by an engineer, in the other by an architect. And while on the subject I may say that there is no doubt that the London County Council are well aware of the disastrous muddling policy of their predecessors in street planning, and in the scheme of Kingsway and Aldwych they have shown great skill in laying out, except in the case of the left horn of the Strand Crescent. Financial considerations have here interfered to mar a great improvement. The pity of it is that when once the buildings are up there is no possible chance of altering the line of frontage.

Now we come to the last stage of our paper—the future of Regent Street. There have been of late years five important reconstructions of buildings in this street. In chronological order they come thus:—The Hanover Chapel, Waterloo Place, Robinson & Cleaver's, St. Philip's Chapel and St. James's Hall. In the words of St. Paul, "all things are lawful, but all are not expedient." It is lawful to criticise all these designs, but, at the same time, hardly expedient. Accordingly I will not discuss the new façades in Waterloo Place; but I have described the destruction of the Hanover Chapel as lamentable, and this description suits equally well the erection of the building that replaced it, and even better the monstrosity erected by Robinson & Cleaver.

I will say no more on this subject, but turn to the design for the rebuilding of the quadrant. This we have seen on paper, and can now fairly judge by the actual work. I confess that I view it with mixed feelings; the predominant one, admiration for the architect and the Office of Works; but together with this is present a haunting sense of fear that it is too good to last. I cannot divest myself of the feeling that it is not twentieth-century architecture. I wish it were. I repeat "all things are lawful," but is it expedient that we should deliberately set ourselves in opposition to the tendencies of the age? Bad as they may be, they form a part of the essential spirit of the times. Now I consider this design to be the finest effort of modern times, and I pray for its success. In principle, too, it is absolutely right, but the old remark of the cynic, "I don't believe in principle, but oh, I *do* in interest," comes forcibly to my mind in this connection. If you are letting shops, you must consider the interests of the shopkeeper. Do not think that I would advocate the plate-glass construction, but I think there is a *via media*, by the use of metal columns, which would overcome the difficulty. For the eye is gradually being accustomed to estimate the strength of metal at its proper worth, and not to require that great bulk for its satisfaction which it does in other materials. It is not alone in this country that we are "up against" this question, as our Transatlantic cousins would say. European and American architects are equally confronted by it. In "the States" I have seen some ground-floor shop-fronts that seemed to me in a great measure to solve the problem. They had bronze columns that both were and looked strong enough to carry the superincumbent structure, and yet were not offensive in design or obstructive to the display of goods.

Mr. H. T. HARE said it gave him great pleasure to propose a vote of thanks to Mr. Macartney for his interesting and unusual paper. It was an unusual kind of paper because it was not often they had an historical survey of a portion of London so well known to most of them. He, however, knew very little of the history, and he had no doubt that many of those present had been as ignorant on the subject as himself. The paper for the most part was merely a statement of facts, and did not therefore admit of much criticism. The lay out of Regent Street and the motive for the turn in the street in Langham Place was obscure, but whatever might have been the motive it seemed to him to be a fortunate accident, if it was an accident. Had the street gone straight through in the line that Nash intended, Regent Street would not have been so interesting as it was at the present time. With regard to the rebuilding of the street, of course there was much which could be said in relation to the recent developments, but one felt a great deal of diffidence in expressing what could be

said in view of the work of so eminent an architect as Mr. Norman Shaw. If the same method of procedure was to be followed as had been allowed in some buildings at the northern end of the street it would not be satisfactory. A regulation should be made that no individual building should be erected at all, and that the street should be built in one conception, otherwise they would have each separate occupation having its different expression. What Mr. Macartney said with regard to shop fronts and modern requirements he, Mr. Hare, could not quite agree with, for he believed it was an easy matter for the requirements of the shopkeeper in the way of window space to be exaggerated. The amount of glass taken up by piers was not unreasonable. The only trade probably which might benefit by utilising every inch of glass was the draper. In no other trade but that could he see that the maximum amount of glass space was required. The belief of the shopkeeper should not be taken as an absolute necessity. Of course he did not mean to say it should not be considered, but he thought there should be moderation in considering the architectural aspect with the commercial requirements.

Mr. H. H. STATHAM, who seconded the vote of thanks, said it was not so easy to discuss a historical paper of which the general facts were not new. At the conclusion of the paper, however, they came to the present and future treatment of the street, and for the most part he supported the opinion that Mr. Hare had expressed. The feeling he had was anxiety whether the present scheme was not too fine or costly to have the whole quadrant carried out in that way. Such a development would be magnificent. He could wish to see emphasised what Mr. Macartney had said as to the planning of Regent Street, and he thought Nash deserved great credit for his treatment of it. The idea of Nash was to divide up the whole street into blocks, in which each block should express some individual element, and this undoubtedly was the proper way to treat a long street with architectural effect and dignity. There was one thing about the new design, and that was that the upper portion could not stand on the piers, and he thought they would find there must be iron girders inside to take the superstructure, an arrangement to be regretted.

Mr. ARTHUR KEEN objected that the new buildings in Regent Street were being carried to such an enormous height. He thought the quality of the quadrant would be affected by this, since the scale of the street would be lost.

The CHAIRMAN thanked Mr. Macartney for having so successfully put before them the history of so important a street, and it was a history that would be new to many persons. The arcade question had not been touched upon, and yet in the modern development of streets such treatment was important in the planning of buildings erected in cities.

Mr. MACARTNEY, in reply to the questions put to him, said that as regarded the question of arcading and columns standing out over a pavement there was not the slightest doubt that they were removed in Regent Street because the shopkeepers found them a nuisance, since they were often made to serve as latrines. He agreed with Mr. Keen about the height of the new buildings in Regent Street. The scale was too big and too good to last. He did not think it would be continued, and it was a serious point, for the new buildings remained out of scale with the rest of the street.

RESTORATION OF HOLYROOD ABBEY CHURCH.

By THOMAS ROSS.

I HAVE endeavoured to remain silent with regard to Lord Leven's proposed restoration of Holyrood Chapel, as I am so largely concerned, but I cannot remain silent in face of Lord Rosebery's public challenge. I would therefore ask you to insert in your paper the notes that I wrote at the time of the original controversy for my own satisfaction. In the first place, I briefly describe what of the church remains, the history of its construction, and how it came into its present singular condition of ruin—it is quite necessary to know this in order to understand Holyrood—and conclude with a few remarks on the report by Professor Lethaby.

The nave is the only part of the church now remaining. Its interior length is about 129 feet by 60 feet wide. It has a central avenue, with north and south aisles. The outside walls of both aisles, with the vault of the south aisle, are standing, as are the row of pillars, seven in number, with their connecting arches forming the arcade. The triforium

storey above also remains. The opposite, or north row, of pillars, and all that existed above them, including the lofty vaulted roof, have perished—only the wreck of two pillars remaining.

Thus it will be seen that the arcade and wall on one side are almost entire, the clerestory having perished, and on the opposite side all is clean swept away. The west wall is practically entire, and the great west piers and arch of the central tower at the east end are also entire. The stonework of the low tower at the north-west corner may be said to be entire. It, along with its companion at the other corner, was finished up to about 1544 with a square, stunted timber spire. After the removal of the companion tower in the seventeenth century, this spire was removed from the existing tower, and a timber-leaded steeple was put up, almost identical in design with the existing steeple of St. Ninian's, Leith. I do not know when this was taken down and the existing lead platform put on.

Professor Lethaby opens his report with a description of the existing remains of the church, and towards the end he says that "these remains are but a small portion of the complete nave." I would be inclined to say that considerably more than one-half of the nave remains. The history of the construction of the church is as follows:—

The nave was begun towards the end of the twelfth century, and, like St. Andrews Cathedral, it was built without buttresses, although it was intended from the beginning to be groin vaulted. It was before the idea of such adjuncts as buttresses had been fully developed. It was probably finished after the middle of the thirteenth century. Nothing further is heard of the structure till the time of Abbot Crawford, 1457-83 (a period of about 200 years), when he built a row of buttresses against the wall of the north aisle, and another row in the cloister about 10 feet in front of the south aisle wall. The reasons for this change in the relative positions of the buttresses are that the outside of this south wall is enriched with a double arcade, which the Abbot seemingly wished to conserve; also that the buttresses in this position were useful in connection with a covered walk in the cloister.

From this southern row of buttresses Abbot Crawford threw a broad heavy flying buttress against the top of the south aisle wall. He then reared a buttress on the top of this aisle wall, resting it partly on this flying buttress; then from his north and south upright buttresses he threw across the aisles flying buttresses against the clerestory walls. The high buttresses on the south wall are of considerably less weight than those on the north side. This, of course, minimises the risk of damage to the wall and vault of the south aisle, but they were quite equal to the strain put on them by the high vault, as they are still standing. These details show that Abbot Crawford was quite abreast with the best methods of construction, and his application of these to an old building shows a perfect mastery of the principles of Mediæval architecture.

For the purpose of this review this may be regarded as practically all he did, although it has been often stated that he rebuilt the church. Abbot Crawford has not told us why he carried out this work, but the reason is quite obvious. Undoubtedly the arches of the great vault and of the aisles were pressing the walls outwards, and his expedient to counteract this was most admirable. He completely remedied the original defects of the construction; and with fair play and attention the church might have been standing to-day. The high roof on the outside was apparently covered with lead on rafters; the north aisle with stone slabs. How the south aisle was treated I do not know.

After the English invasion of 1544 the church was subjected to great neglect and indignity. The outer lead covering had been stripped off, thus exposing the stone vault. Charles I. expended considerable sums in putting the fabric in repair for his coronation, which took place within its walls with great pomp and splendour in 1633. The last important episode in its history was its being fitted up as a chapel for the Knights of the Thistle by James II. in 1688. Ere it was completed an Edinburgh mob—on the eve of the Revolution—broke into the building and tore down whatever they could lay their hands on. The history of the chapel for the next seventy years is obscure, but its condition was evidently serious when, in 1758, a new roof, composed of heavy stone slabs, which necessitated the use of a good deal of masonry, was put on, and ten years later, during the night of December 2, 1768, it fell, reducing the church to its present condition. During his interval attention was drawn to the dangerous state of the church, but the warning fell on deaf ears.

Now, the question arises, what caused it to fall?

What *did* happen was this. The flying buttresses, or the props (as we may call them), on the north side gave way. Nothing else will account for the disaster and for the present condition of the church. It was like cutting the string of a bow—the outward thrust came into immediate operation. It was not a downward crushing weight, as is generally supposed. The walls would have stood this weight many times over, and the south wall did sustain it; but when one or more of the north props gave way, the pressure of the south flying buttresses, intended to counteract the outward pressure of the vault, operated the other way and sent over the south clerestory and the roof. The mass, gathering strength, sent over the north clerestory crash down on the top of the north aisle vault, smashing any of the flying buttresses which might otherwise have stood firm, and in turn this confined, tumbling uproar of ruin burst the pillars inwards, and the result is what we see to-day; but the south buttresses of Abbot Crawford stood the strain, and have not moved one hairbreadth—they saved the north aisle wall (the south one was not in danger) and his flying buttresses would have saved the whole structure had they been properly attended to and kept in repair. These flying buttresses were exactly 300 years old. They were up in the air, difficult of access, and exposed on all sides to gun shots and to the effects of storm, rain and frost, and clearly no attention was paid to their condition. Need we wonder if the centre one (which was subject to the greatest pressure) gave way suddenly, and the falling walls broke all the others and the whole thing came down like a child's house of cards? All this is perfectly plain, and accounts for the disaster in a clear and practical way, and the only possible way. There is a remarkable illustration of the tremendous effect of the falling mass of masonry to be seen at the great piers of the crossing, which at the same time is a striking testimony to the splendid nature of the masonry of the church. It may fairly be surmised why it was that the north flying buttresses gave way rather than those of the south. They were considerably longer (about 5 feet), consequently of less strength. To compensate this they were slightly increased in breadth (9 inches), so as to make them strong enough. Now, Abbot Crawford might have shortened these. Why he did not do so is another proof of his knowledge and skill. The north aisle wall, then as now, had an outward leaning, and still more so had the vanished clerestory wall. His object was to keep these in their position and prevent them from going further. The design on the north side shows how careful he was to avoid incorporating his new work with the old, only providing a sure and firm rest for the inclining walls. Had he shortened the flying buttresses, he would have been obliged to tie the new work to the old by taking a grip of the top of the aisle wall, by which operation he would have run the risk of dislocating the old groin vaulting, had his new heavy buttresses forced the old aisle wall into a different position; and as a section of the church shows this was not an unlikely event.

Having traced the history of the construction of the church and the cause of its fall, I proceed to point out what Lord Leven proposed doing.

It was proposed to rebuild the pillars, the triforium and clerestory of the north side, and re-erect the fallen clerestory of the south side, to restore the central groined roof as also that of the north aisle, and to re-erect the flying buttresses. I need not go into further details, such as finishing the top of the east and west gables, new outside roof, glazing, flooring, &c. Nothing was proposed to be done to the tower.

I will now make a few remarks on Professor Lethaby's report, which, as is well known, recommends that the scheme of restoring the Chapel Royal should not be entered on, and I think I am correct in saying that in support of this recommendation three counts are brought forward.

First, the decayed state of the walls and arches.

Second, that most of the existing work is out of the vertical.

Third, that there is no sufficient evidence for making anew certain of the lost parts.

As to No. 1, the report says:—"The walls and arches are much decayed by the weather and disintegrated by the action of smoke deposits, &c." It may be asked, are there any walls, centuries old, in any large town of which some such remark might not be made? Fortunately, however, we have Professor Lethaby's assurance that it is the surface which is "everywhere attacked and blackened," so that the decay may be said to be only skin deep.

The outside of every building is exposed more or less to these influences, and for a period of about five centuries

the atmosphere of Holyrood was that of a rural village, and during this long time there formed on the stone what masons call its natural skin, hardened under the most favourable circumstances, and this is the reason why the outside of the walls show so well to-day. Then, for the interior, it was not intended to be exposed, and it is quite certain that it is only since it was exposed that it has deteriorated in the manner we see. To reroof the building will surely not accelerate this, but rather by protecting it from the weather will it be found to be the only way of averting this decay. Probably, for any ordinary building fallen into ruin, this would be admitted by most proprietors, but because it chances that Holyrood is a building of historic fame and a fine example of architecture, there is neither rhyme nor reason for the reversal of such a sound principle. The rain falls on the just and the unjust alike, and so does it on the finest historic monument and on the meanest hovel.

The pillars, we are told, are "largely patched with cement." Where the falling walls struck the edges of the pillars some of them doubtless got injured, and these are now patched with cement in several places. To suggest that this is serious is to exaggerate. The pillars and arches are composed of the very finest masonry, and show no signs of fracture or crushing—any weathering or decay is confined to the surface. Their mouldings are clear, sharp and in good condition, and the freestone was undoubtedly from a first-class quarry and well selected for the important purpose. When Professor Lethaby tells us that the pillars seem to be better than they are, he should have said that they are better than they seem.

We are told that "the triforium is in a still worse condition," and that the three eastmost bays "are formless in respect to mouldings and details." I say this is an overstatement. The forms of the arches are quite distinct, and one-half of the cap mouldings remain at the ingoings. The remainder of the triforium is in fairly good order, except the shafts and vaulting shafts, which are kept in place by hoop-iron straps where they have not fallen away altogether, as many of them have; they were doubtless swept away by the falling masonry and by subsequent exposure. These features can all be restored exactly as they were, as every shaft missing from one place can be restored from corresponding ones found remaining in other parts. It should be understood that these shafts are ornamental, and that the walls will stand and bear the clerestory and vault, whether they are restored or not.

As to restoring the broken string-mouldings and bases to which Professor Lethaby refers, the idea is to leave them as they are, but restore them on the new wall opposite; for every feature required on this wall there is a precedent in the old one. I would leave the old walls very much alone, with all their scars, furrows and wrinkles.

No. 2.—That most of the existing work is out of the vertical. Professor Lethaby obtained the figures of the divergence of the walls on his one-day visit to Holyrood. I agree with him in saying that some of these are serious—and in the instance of the pillars and south wall of the nave, unless some protective measures are taken, the seriousness will undoubtedly increase. Of this wall Professor Lethaby says that it "should not be loaded with a new clerestory and roof, to say nothing of a stone vault." I cannot agree with this opinion. The wall is perfectly able to support the weight it was intended to bear, and which it did carry for 500 years, and which it would have carried for centuries to come but for the neglect and carelessness already referred to. Will Professor Lethaby say that this wall, if prevented from falling forward, will not bear the crushing weight it sustained 140 years ago? This is a matter of figures, and I can assure the Professor that it will carry the proposed weight many times over; and the stone vault is the thing which will prevent this leaning wall from going further; and that it does lean, and lean inwards, is a point decidedly in favour of what is proposed. To restore the stone vaulting is the thing that will save the church from utter ruin. There is probably not an architect in the country who has not loaded walls of poorer substance than those of Holyrood with far greater proportionate weight than is proposed to be done here, and weight which they were never intended to carry; while at Holyrood it is only intended to put back the weight the pillars were designed to bear, and which they did bear for centuries. The leaning of various other parts is all carefully detailed. Professor Lethaby knows how to rely on the cumulative effect of these insignificant details, which are of no practical account. What does it matter that the

north aisle wall (4 feet thick) leans outward 4 inches? It has not moved since Abbot Crawford's time, and it never will nor can move. That the tower should lean 4 inches one way and 7 inches another is not of the least consequence, and as Lord Leven had no intention of touching it, it is a matter quite irrelevant.

The west wall, we are informed, leans outwards $4\frac{1}{2}$ inches. Is this serious in a wall 10 feet thick for a height of about 50 feet? Above this level, to a height of about 60 feet, the wall is reduced to 6 feet thick, and the reduced wall so placed as to counteract the outward bend, and the few feet of new wall required will still further serve the same purpose. But I will not do the Professor the injustice to suppose that he dreads the outward falling of this splendid west front.

No. 3.—That there is no sufficient evidence for making anew certain lost parts.

Under this count the clerestory and west gable are twice referred to, so that they may be regarded as Professor Lethaby's strong points. We are told that "the form of the clerestory and west gable are unknown." If Professor Lethaby had called on me when in Edinburgh I would have prevented him making this double mistake twice over. The kind of vaulting, as he may remember, is sexpartite. The working out of this with plan and sections will give the form; the height is marked on the ruin, but even without this latter it can be obtained, three points of a circle being given; the problem is to find the centre. At Holyrood Professor Lethaby can get five points. Not only is its form not unknown, but the height, width and number of its windows are not unknown. This shows that Holyrood cannot be taken in at one visit. Then as to the west gable, it stands to the height of the vaulting, about 60 feet above the doorstep. It might have occurred to Professor Lethaby that the form of the west gable would take the form of the roof behind, more especially as the east gable is standing and has that form.

Does the Professor not know that there is a measured drawing in existence giving the last form of the west gable?

The report goes on to deplore the condition of the north doorway and the glorious west doorway (and here it is a pleasure to heartily join Professor Lethaby in admiration of this splendid piece of work), with calculations of how much of its carving is lost and of how much remains. But what has all this to do with the rebuilding of fallen Holyrood? Just as much as the building of Tenterden steeple had to do with the formation of the Goodwin Sands: nothing whatever. It was no part of the proposed restoration to touch either doorway—there they are, let them alone.

We are informed that the carved capitals of the arcade are mostly "shapeless masses." This, again, is a subject quite outside the proposed work, but is it true that they are in this condition? The carving is sound, but in many instances is filled up with soot and dirt, which could all be removed without the use of an iron tool. The Professor gravely asks, "What is to be done with work which might be called late and debased?" Does he expect a serious answer to this? If so, I would say, let it remain in its late debasement. There is nothing to be ashamed of in this so-called debased work in the west front. The Professor calls it "curious but interesting." Yes, it is very curious, very interesting, even pathetic, when one knows its history. But it is not of the time of Charles II., as probably by a slip Professor Lethaby says it is.

Towards the end of the report we are told "what is old would largely disappear in handling it, and that in turn would be swamped by entirely modern work." How what has disappeared in handling can be afterwards swamped by something else is not quite clear.

THE ROYAL OBSERVATORY, GREENWICH.

A SPECIAL committee was appointed by the Admiralty in July to inquire into the working of the London County Council's electricity generating station at Greenwich in relation to the Royal Observatory. The committee consisted of Lord Rosse, representing the Royal Observatory, Professor J. A. Ewing, representing the Admiralty, and Sir Benjamin Baker, representing the Council. The conclusions arrived at by the special committee, after an exhaustive inquiry, are contained in the following recommendations, in which are suggested certain modifications in the arrangements at the generating station, and as to the manner and times at which the first portion of this station shall be worked, so as to avoid any possible interference

with the work of the Observatory:—(a) The question, both as regards effects of vibration and obstruction through chimneys or discharge from chimneys, to be further reviewed after, say, two years, by which time experience should be obtained with the second portion of the station at work. (b) The generating plant for the second portion to be turbines, which, as well as the dynamos, must be of a perfectly balanced type, such as has been proved by trial not to cause vibration. (c) An undertaking to be obtained that when the plant in the second portion is available for use, the reciprocating engines of the first portion shall not in ordinary circumstances be used after 10 P.M., and their use shall be restricted as far as possible after 8.30 P.M. (d) The two chimneys of the second portion, at present incomplete, to be not higher than 204 feet above Ordnance datum. (e) The discharge of gases both from these and from the existing chimneys not to be materially hotter than the discharge is now from the existing chimneys, namely, about 250 deg. Fahr. (f) No further extension of the station to be made beyond the 20,000 kilowatts now contemplated in the equipment of the second portion.

The highways committee are advised that the difficulty with regard to the erection of the second two chimneys to their full height of 271.88 feet above Ordnance datum would be met if one of them were carried to the same height as the existing chimneys, and if the other, which is on the meridian of the altazimuth, were constructed to a less height, so as not to interfere with the observations on that meridian. This continuation upwards of one of the chimneys would have the additional advantage of minimising any possible interference with observations by the hot gases from the other chimney. Moreover, it is thought that, as regards the arrangements for the working of the reciprocating engines, it may be practicable to establish means of communication between the Observatory and the Greenwich generating station, so that the Astronomer Royal and his assistants may communicate with the Council's officials whenever it is proposed to take observations, in order that the working of the machinery may be modified to meet the requirements of the Observatory.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the rooms of the above Society on Thursday, the 7th inst., Mr. W. H. Thorp, F.R.I.B.A., read a paper on "Villas and Gardens of Rome, Tivoli and Frascati." Mr. H. S. Chorley, president, was chairman. The lecturer drew a comparison between an ancient country house of a Roman patrician of the time of the Cæsars, and the sumptuous villas erected by the wealthy cardinals in the sixteenth and seventeenth centuries in the vicinity of Rome, and more especially those to be found in the favourite resorts of Tivoli and Frascati. Leaving classical times behind and devoting ourselves to the country house and its garden of the Renaissance, it may be well, he said, before describing any villa in particular, to take note of the general characteristics that pertain to Italian villas as a class. More often than not they are built on a hill-side. This afforded the architect an opportunity to place his house in a fine position for effect, and for so arranging his terraces, avenues and balustraded flights of steps as to enhance its attractions. The garden setting in truth is sometimes so elaborate in its devising that it outvies in importance the villa itself. Strange as it may appear to us, the cult of flowers and the brilliant effects of colour to be obtained thereby did not form an important feature in the Italian garden decoration scheme, and the architect relied for his effects on other means than those afforded by the massing of vivid colour in carpet-like flower-beds. Benches of marble bordered the avenues at intervals, and statues, vases and relics of antique sculpture stand out in sharp relief from the sombre background of cyprus and evergreen oak. Nothing probably impresses the visitor more than the variety imparted to the gardens by the introduction of water in the form of cascades and fountains for adding to their charms. In many cases the hydraulic engineer was a man of renown or ranked in equal importance with the architect. The term "villa" in the Italian sense of the word is not applied merely to the country house itself, but includes the whole of the estate, with its vineyards, olive plantations and gardens. The country house or Italian "Maison de plaisance" did not usually demand the extensive accommodation of the Palazzo in the

city; hence it was planned on a smaller scale. Its arrangement of rooms was simpler and did not as a rule comprise the extensive suites of apartments considered necessary for the nobleman's town house. As befitted its situation in the suburbs or country an airy and cheerful aspect was desired and secured by means of loggias, open arcades and lofty rooms, with balconies giving upon the landscape. The lecturer described in detail the Villa Medici and Villa Borghese in Rome, Villa d'Este in Tivoli, and Villa Aldobrandini, Villa Falconieri, Villa Mondragone, and Villa Torlonia in Frascati, and illustrated them with lantern slides.

PEVENSEY CASTLE EXCAVATIONS.

FOR about three months men have been engaged on the excavations which are being carried out at Pevensey Castle, and particularly inside the area of the Roman walls in the part historically known as the "outer bailey," and the work is being continued with much vigour. It is hoped to further add to the results before the close of the winter necessitates a temporary abandonment. It is rather important to remember, says the *Sussex Daily News*, that in view of the known facts concerning the traditions of the castle, the results of the excavations must necessarily be small and not by any means sensational, such as might be expected from the exploration of a buried Roman city or a site on which there existed and lived a civil population, such as was the case at Silchester, in Hampshire, for example. In this place traces of streets and buildings, and an accumulation of objects connected with the ordinary life of a people were discovered, but it must be borne in mind that Anderida (Pevensey) was purely a military camp, and, comprising as it did a link in the chain of stations on the Saxon shore, was merely an outpost of Roman power.

Nor was Anderida occupied by picked troops of the Roman army; the probability is that it contained a small garrison, with perhaps an auxiliary force of Britons who were coerced into the Roman service. At any rate it is certain that the fortress of Anderida was not erected until a late period in the Roman occupation, and consequently was not occupied by the Romans more than a century or perhaps 150 years. While, however, engaged in a comparison of results here and at Silchester, the peculiar interest of the Pevensey excavations centres in the fact that few, if any, cities occupied in a similar way and under identical circumstances, and having been untouched by the spade of the workman for ages, have been excavated in modern times. The present excavations have shown that there were no permanent buildings on the site, at least of that part which has been explored, but they have revealed the existence of a regular line of temporary buildings which agree with the accounts of ancient writers as to the disposition of a Roman camp. In years gone by a controversy raged round the question of the accurate site of the ancient Anderida, and the general weight of the circumstantial evidence was in favour of Pevensey.

The present investigations have furnished valuable testimony in support of this theory, and it may be anticipated with some measure of confidence that when the work is brought to a successful conclusion this question will have been settled beyond doubt for all time. One important object in view is the pronouncement, as near as possible, of the date when the Roman settlement took place and the huge walls surrounding the area were built, and much evidence has been secured towards the satisfactory solution of these questions. The pottery and bones which have hitherto been discovered are of a very fragmentary character, and necessarily so, for it must be remembered that on the withdrawal of the Roman forces they would be likely to carry away with them almost every article of utility, and in the subsequent troublous times, the Britons would no doubt make havoc of everything which remained. However, the excavations have already produced quite a representative collection of different kinds of Roman pottery, including a rather large proportion of painted ware in imitation of true Samian, which is by no means common. After Roman times the fortress was occupied by the Britons, and numerous traces of the memorable siege by the Saxons of 490, so graphically described by the historian, have been found, with additional traces of Norman and Mediæval occupation. Careful records are being kept of all the discoveries, and plans are being prepared of the parts uncovered from accurate measurements. It is now proposed to excavate the great Decuman gate from the west end, and the Prætorian gate on the east; also the Southern Postern

gate, which is at present completely buried beneath débris. It is probable that an exhibition will be held at the conclusion of the season's labours, when the specimens will be on view and papers read dealing with the excavations and results. It may be noted, however, that exploration necessitates funds, and, as the supplies are running short, an appeal for financial aid is made to enable the work to be completely and thoroughly done. Money may be sent to Mr. L. F. Salzmann, 16 James Street, Haymarket.

Proposed National Association for Monumental Sculptors.

SIR,—As the result of a correspondence I commenced in another journal last August, it has been decided to hold a preliminary meeting for discussing proposed Association, electing a committee, &c. The meeting will be held at the Cannon Street Hotel, London, in the afternoon of Tuesday, March 12, at three o'clock, to be followed by a dinner at eight o'clock on same day. The meeting is only open to master sculptors and masons, and by ticket only, application for which should be made not later than March 3 to the undersigned.—Yours, &c., WILLIAM BORROWDALE.
Durham Road, Sunderland.

GENERAL.

The Royal Scottish Society of Painters in Water-Colours at their twenty-ninth annual general meeting elected Sir Francis Powell, R.W.S., as president for the ensuing year, Mr. W. M. Taggart, R.S.A., as vice-president and Mr. A. MacBride, R.I., as deputy president.

Mr. John Ely, architect, King Street West, Manchester, has been awarded the first premium of 50*l.* in the competition of designs for the enlargement of the Salford Royal Hospital. Mr. John Keith D. Young acted as assessor. The extension committee have issued an urgent appeal for 70,000*l.* to enable them to carry out the complete scheme of extension, which includes the purchase of land.

M. Edouard Détaillé, the French painter, has been enrolled in the second class of the Victorian Order.

The Edinburgh Architectural Association discussed on Wednesday the following motion by Mr. James Bruce, W.S. (a lay member):—"That, looking to the public interest that has been aroused on the question of the repair and restoration of the Chapel Royal, Holyrood, through the intimation of a legacy of 40,000*l.* for these purposes by the late Earl of Leven and Melville, it be remitted to the Council to report upon the following points, viz. :—(1) What remains of the structure exist; (2) the conditions and capabilities of the parts remaining; (3) whether the evidence of these parts is sufficient to enable a satisfactory repair and restoration of the structure to be made."

The Education Committee of the London County Council have appointed an advisory sub-committee for the school of building, consisting of Messrs. W. H. Atkin Berry, F.R.I.B.A., W. J. Carpenter, J. S. Holliday (of Messrs. Holliday & Greenwood), F. Higgs (of Messrs. F. & F. H. Higgs), H. R. Taylor, G. Dew, Lewen Sharp, F.R.I.B.A., F. Barter (United Operative Plumbers' Association), and R. F. Gilling (National Association of Operative Plasterers).

The Chester Education Committee on Monday unanimously approved of the plans for the erection of a new public elementary school in Love Street at a cost of 13,700*l.*

The Holborn Borough Council have received the sanction of the London County Council for a loan of 20,000*l.* in connection with the extension of the municipal offices. It is proposed to convert the ground floor of the present town hall into shops.

Mr. Louis Ambler, architect, has been elected chairman of the Council of the Society of Yorkshiremen in London.

The Committee of Henshaw's Blind Asylum has, subject to the approval of the Governors of the Institution, selected the plans of Messrs. Mangnall & Littlewood, architects, Manchester, for rebuilding Hayesleigh, Warwick Road, Old Trafford, at an estimated cost of 25,843*l.* A large number of plans were submitted.

The Brussels Fine Arts Society known as the "Libre Esthétique" intend to include a series of works by the late Eugène Carrière in the next exhibition. He was known by his idealisations of scenes of Parisian life.

An Exhibition of the works of Mr. F. J. Shields is to be held in Manchester.

Dr. Martin, assistant director of the Mauritshuis museum, The Hague, will deliver two lectures on Dutch landscape art at the Royal Institution on February 28 and March 7, and he will repeat them at University College on March 5 and 12. The subject of the first lecture will be "The Development of Landscape Painting in Dutch and Flemish Art until about the Year 1600;" and of the second, "Landscape Painting in Holland in the Seventeenth Century." The lectures will be delivered in English, and will be illustrated by lantern slides.

Sir R. Rowand Anderson has prepared a report with plans on the proposed physics laboratory for Dundee University College.

Mr. Wm. H. Goodyear, curator of fine arts in the Brooklyn Museum, has been elected an honorary member of the Royal Academy of Fine Arts in Milan, in recognition of the contributions to Mediæval architectural research in Italy which have been made by the Brooklyn Museum. Mr. Goodyear was also elected a corresponding member of the American Institute of Architects at the Annual Convention.

The Carnegie Dunfermline Trust recently invited plans for a branch library in the city at a cost of 5,000*l.*, and offered three premiums of 20*l.*, 15*l.* and 10*l.* Nearly 100 plans were sent in from all parts of Scotland. Mr. George Wilson, of the firm of Messrs. Sidney Mitchell & Wilson, architects, Edinburgh, acted as assessor, and made his award as follows:—(1) Mr. Hippolyte J. Blanc, Rutland Square, Edinburgh; (2) Mr. J. Cumming Wynnes, Woodburn Terrace, Edinburgh; (3) the late Mr. Andrew Muirhead, Dunfermline. A committee of the Trust, however, in making a choice of the plans for their buildings, decided on those of Messrs. H. & D. Barclay, Glasgow, as being the most suitable.

The Award of the official referee (Mr. Muir Mackenzie) in the litigation between Mr. A. Kellett, contractor, and the Stockport Corporation is likely to be the subject of an appeal. Mr. Kellett complained that he had been prevented from carrying out his contract to construct a dam in the Kinder Valley in connection with the waterworks scheme, and Mr. Mackenzie awarded him 52,546*l.*, 29,400*l.* being for loss of profit on the contract. Mr. Bailhache, counsel for the Stockport Corporation, applied to Justices Phillimore and Bucknill in London for a stay of execution as to the 29,400*l.*, stating that he desired to take the opinion of the Court of Appeal on this point. Their Lordships granted a stay of execution as to 12,000*l.* only.

A Conference of the National Housing Association will be held to-morrow at 2 P.M. in the Caxton Hall, Westminster.

Mr. Edward Bradbury was on Monday appointed architect to the Pembroke Urban Council, co. Dublin. Objection was raised because he was not a ratepayer, but the voting was in his favour.

The Estates and Finance Committee of the Coventry City Council have considered letters from Captain R. Tudor Owen, of Stratford-on-Avon, asking if they would be prepared to consider an offer for the "Bacchus and Ariadne" picture at present in the room behind the gallery in St. Mary's Hall. The committee resolved that they were prepared to consider an offer. At the Council meeting on Tuesday an alderman said no offer would be accepted without the Council being consulted. The picture was valued many years ago at 700 guineas. It was exhibited as one of the sights of Florence for some 150 years. He hoped the Council would not sanction its sale but agree to spending 60*l.* or so to restore it.

The Governors of the Glasgow School of Art, authorised by the Scotch Education Department, have granted school diplomas to six students. This diploma is the highest award the school can give, and entitles the holder to an associateship of the Glasgow School of Art (G.S.A.). It carries the seal of the Scotch Education Department, and the Department accepts it as a testimonial of professional capacity. This is the first time that awards of diplomas have been made. The works of the candidates in each section of schoolwork were submitted to a jury of judges appointed by the Governors, and with these were associated assessors nominated by the Governors and approved of by the Scotch Education Department. Eleven candidates submitted works.

THE WEEK.

appeal has been issued by the Duke of DEVON as Chancellor of the University of Cambridge to meet the requirements of the present time. Lordship says in all a capital sum of nearly one million and a half, apart from any question of a pension for professors, might without extravagance be immediately expended on the equipment of and on the provision of staff for the university. Buildings will take a large part of the amount. A sum of 25,000*l.* at once is urgently needed for a new museum of archaeology and ethnology, for the preservation and for the payment for the use of researchers of the valuable collections possessed by the university. A new, or at least a greatly enlarged, museum of zoology has become necessary. About 20,000*l.* is demanded for the completion of the medical school. Lecture-rooms will have to be provided for the teaching of history and also for mathematics. Lord RAYLEIGH is devoting part of the Nobel Prize of 7,700*l.*, which he was awarded, towards the extension of the Cavendish laboratory, and the purchase of scientific books. Additional accommodation is wanted in the departments of literature, engineering and chemistry. As the number of students is increasing—there are at present 3,300 in attendance—delay in providing classrooms and museums will cause much inconvenience.

ALTHOUGH several months have elapsed since the church of St. Michael, in Hamburg, was destroyed, arrangements for its rebuilding remain unsettled. Discussion concerning the style which should be adopted occupied the members of the Berlin Union of Architects at their last sitting. Germany is now making experiments which are taken to be proofs that a new style is a possibility, and, as was to be expected, speakers were generally in favour of avoiding the style which the building presented at the time of the fire. As it was eighteenth-century work it was not of great value, but it was believed to be a reproduction of the style of an earlier time. The authority of the architect, and of WAGNER, the composer, was invoked. The former said that an artist was guilty of a crime when he attempted to produce the work of an earlier time, and he should always adhere to something new of the time in which he lived. WAGNER likewise advised his disciples at Bayreuth to produce nothing that was new; if they acted otherwise the reproach of unproductivity would seize them by the throat and they would become the most miserable of mortals. It was also held that as the church was intended for funeral services Mediaeval planning was inadequate. It was unanimously resolved that the new church should be a living witness of a living age instead of a copy of one that had vanished.

THE case of *The Great Central Railway Co. v. Assessment Committee of Banbury Union* raises a question as to the proper principles of rating a railway, of considerable interest to rating authorities and railway companies. The line in question is a line which runs from Woodford to Banbury, and connects the lines of the Great Central and the Great Western railways. There are no stations or sidings on the line. Its value is as a connecting line, and in the absence of an agreement as to mutual working between the two companies, it would be valueless to either. The Great Western Railway Company had advanced money for the purpose of building the line, and the Great Central Railway Company paid 3½ per cent. interest on the sum so advanced. The question was, whether this interest be taken into account as admissible evidence of rateable value? Or could the rating

authorities only consider as evidence the amount which the line earned per mile in the parish imposing the rate? The Court of Appeal have decided that the interest so paid is admissible evidence of rateable value. It was admitted that the cases decided on the question how far rating authorities could take into account matters arising outside their parish were not altogether consistent. But the true principle seems to be that the rating authorities may take into consideration any evidence which would bear upon the value of the property to a hypothetical tenant, provided, of course, that this evidence is reasonably relevant. Profits of an undertaking are not rateable, but capacity to earn profits is an element which may be taken into account in considering the value of the property. The fact that the Great Central Railway Company had agreed to pay this interest was evidence of what they considered likely to be the profit-earning capacity of this piece of line.

WHEN lands are taken compulsorily by statutory powers, is the former owner of the land entitled to compensation for depreciation in the value of the land retained by him, in consequence of acts done upon land near to, but not formerly belonging to him? Upon this question the authorities are not altogether agreed. On the whole the better opinion seems to be that the former owner, though entitled to compensation for his land taken, and for depreciation in the value of his land retained by reason of the user made of the land taken, is not entitled to compensation for depreciation on his property retained by reason of acts done on the land not formerly his. This would seem to be the effect of the decisions in *REX v. MOUNTFORD* (22 *Law Times Reports*, 752) and *HORTON v. Colwyn Bay Urban District Council* (23 *Law Times Reports*, 75). The case of *London and North-Western Railway v. REDDAWAY*, decided the other day by PHILLIMORE, J., which seems to favour a contrary conclusion, is perhaps to be explained by the peculiar wording of the company's Act under which the claim to compensation arose.

OF late years there appears to be little difficulty in accepting the report of an assessor in an architectural competition. The case of the new schools in connection with Henshaw's Blind Asylum, a Lancashire institution, may therefore be considered as exceptional. The competition was limited to Manchester architects, and Mr. JOHN HOLDEN was appointed as assessor. The Board of Management declined to accept any of the premiated plans, because, having particular knowledge of the requirements of the Institution, they had come to the conclusion that the plans of Messrs. MANGNALL & LITTLEWOODS were best suited to their needs, and the authors were appointed architects at a meeting on Tuesday. It was stated by one of the governors that a difficulty might arise if plans selected by the assessor were not adopted. But the Chairman pointed out that the form of advertisement was a protection against such a contingency. The supporters of the Institution, which is not in too prosperous a condition, may well ask why was it necessary to go to the expense of appointing an assessor or to bestow premiums when it was possible to obtain a design without the machinery of a competition? It is quite certain from what was said by the Chairman that the invitation to compete was drawn up in a guarded manner with a view to save the Board from all kinds of consequences. But it should be asked whether the competitors were able to read between the lines and to realise the possibility, if not the certainty, that the judging of the designs by an architect of experience was no more than a matter of form. The Board may be wise in their selection; but they have not taken the public into their confidence by explaining the reasons which induced them to prefer a design which was not premiated or commended.

WILLIAM III. AND THE ARTS.

THE announcement of the gift by the Emperor of GERMANY of a statue of WILLIAM III., which is to be erected before Kensington Palace where the king died, will give rise to many curious reflections. Although WILLIAM III. was compelled, for the transaction of business, to reside in Kensington, he found so much pleasure in Hampton Court that he went there at least once a week. On one of those occasions his horse stumbled, and the king broke his collar-bone. He died after a short illness. According to Bishop BURNET:—"Some moved for a magnificent funeral, but it seemed not decent to run into unnecessary expense when we were entering on a war that must be maintained at a vast charge, so a private funeral was resolved on. But for the honour of his memory a noble monument and an equestrian statue were ordered. Some years must show whether these things were really intended, or if they were only spoke of to excuse the privacy of his funeral, which was scarce decent, so far as it from being magnificent." It is needless to say that what the courtly bishop hinted became a fact. Parliament did not summon sculptors. The only memorial of the great king to whom the country was so much indebted which was set up in London—and a century was allowed to elapse before an attempt was made—was the statue in St. James's Square, the work of the younger BACON, and completed in 1808.

In 1701, or a year before the king's death, an equestrian statue was erected in Dublin, which was unfortunately the reverse of magnificent. As happens with less obtrusive symbols in that strife-torn city, the statue became the object of aversion to one party, and, as if it were a political idol, in a little time efforts were made to destroy horse and rider. Official inquiries were instituted and rewards were offered, but nobody was punished. For many a year the daubing of the group in the colours of rival politicians was a favourite pursuit, and it was almost impossible to prevent the "glorious, pious and immortal memory" of King WILLIAM from becoming as ridiculous as his metal representative. It would almost seem as if fate had destined the king's features to afford amusement. When DRYDEN had completed his translation of VIRGIL, the publisher, JACOB TONSON, wished to have it dedicated to King WILLIAM. But as DRYDEN was deprived of his laureateship by the monarch, and was given other occasions to become disloyal, he refused. Whereupon TONSON had all the engravings in which the features of ÆNEAS were introduced drawn like the king, with a hook nose. The following was one of the epigrams inspired by the feat:—

Old Jacob, by deep judgment swayed,
To please the wise beholders,
Has placed old Nassau's hook-nosed head
On poor Æneas's shoulders.

To make the parallel hold tack,
Methinks there's little lacking;
One took his father pick-a-pack,
And t'other sent his packing.

It is to be hoped the KAISER's gift will not give rise to sarcastic attacks either in verse or prose.

WILLIAM was one of those men who had to suffer because their manner was disagreeable. Always an invalid, asthmatic and nervous, his harsh voice repelled people and compelled Englishmen to believe he was seeking his own interest alone. His fellow-countrymen loved him and he loved them in return. But as BURNET says:—"The ill-returns he met from the English nation, their jealousies of him and their perverseness towards him had too much soured his mind, and had in a great measure alienated him from them, which he did not care enough to conceal, although he saw the ill-effects this had upon his business." A monarch who stood in such a peculiar position, and who valued strategy and statecraft above everything, was not

adapted to promote literature or art. According to HALDANE his reign was our nadir in all that related to imagination. As became a Dutchman, WILLIAM liked to have a handsome and pleasant dwelling-place, and that account architecture and gardening were the arts of peace in which he took pleasure during intervals of his campaigns. His palace of Looz was evidence of his affection for the national surround which supplied by artifice what nature refused. He was eager to create a similar dwelling for himself of the neglected Hampton Court. The air of Looz was not adapted to his constitution, and on the banks of the Thames he thought he was provided with a site that could be made to recall the low, sandy landscape of the Guelders. WREN was accorded full liberty to create buildings which differed vastly from those of WOOD and GIBBONS was allowed to create flowers and fruit in wood, and VERRIO, who was at first rebellious because he was one of the officials of CHARLES II., painted the walls of the staircase almost before they were ready to receive colour. It was perhaps fortunate for WILLIAM that the queen was permitted to have more share in the planning of the new palace than in the public affairs of the country in which she had a right to rule. When some of the courtiers complained about the absence of height in certain of the parts, which they ascribed to WREN's inability, WILLIAM confessed that all the decisions in question were the results of his own command. With all his greatness, an artist found him to be an obstinate patron.

If the opportunity had been properly used Hampton Court could have served to promote English art. WILLIAM apparently made his own arrangements. He obtained his statues for the grounds from Italy. After the king's death a London merchant named BALL applied for the payment of 600*l.* due to him on account of seven marble statues and a marble head which he imported from Italy by His Majesty's order. The list included an "Autumn with two Satyrs," a "Ceres," a "Venus," an "Apollo," a "Vulcan," a "Satyr," a double statue of "Pan and Orpheus," and an "Athenian Philosopher." They cost the merchant 555*l.* in London and there was 45*l.* for freight and other charges. BALL was informed that he could remove the statues if he wished. Hampton Court was a constant grievance to the economical reformers of the time. VERRIO was in his claim. The king agreed with him that he was to be paid 400*l.* for painting the great bedchamber and he received the money. For the great staircase and the little bedchamber he was to receive 1,800*l.* of that amount was owing to him.

In justice to WILLIAM it must be said that he failed to encourage English art, he was no less indifferent to the work of foreigners. If a merchant BALL offered to paint the walls as well as to provide sculpture he would be likely to receive an order. Affairs which monopolised the king's attention were important to be forgotten for a short time, although he might be acting as a votary of art. In the course of his life he afforded subjects for battle-painters, but he gave no commissions to have them represented. Unlike his great enemy LOUIS XIV., he fought his own battles instead of choosing mottoes for the medals that rewarded them, for, as WALPOLE says, he had no leisure to look over the registers of his fame.

It cannot, however, be asserted that the reign of WILLIAM III. was entirely fruitless. In estimating the influence the state of the country should be considered. London had not completely recovered from the effects of the Great Fire when he ascended the throne. The short reign of JAMES II. had rendered men uncertain about the stability of their property, for it was apprehended that a French invasion was likely to take place with the approval of the English king. The erection of such important mansions as Althorpe and Chiswick, among others, and several residences in London, were indications of the revival of faith in the security of England. The style of building which is ascribed

Queen ANNE has more right to bear the name of brother-in-law, for the imitation of Dutch houses during his reign. The influence of WREN was strong. But with all his classicism he was indisposed to adopt a suggestion from Holland. WILLIAM TALMAN was comptroller of works to WILLIAM III., and Dynham House, Swallowfield, and Ickworth arose in WILLIAM'S time. VANBRUGH did not display his architectural skill before 1702, and therefore belongs to the next reign. But HAWKESWORTH was acting in 1690 as clerk of works in Kensington Palace, which was erected for WILLIAM. The end of the seventeenth century was therefore not entirely deficient in skilled architects.

There were also some painters. When WILLIAM III. came to Hampton Court the cartoons by RAPHAEL, which CROMWELL had secured for the nation, were lying in boxes. The king ordered a gallery to be erected to contain them. He employed HENRY COOK, an Englishman, and a pupil of SALVATOR ROSA, to repair them. JOHN RILEY, who painted the king and queen several times, had the reputation of being an excellent portrait-painter. But it must be owned that the English painters were lost amid the numerous foreigners. Sculpture had no prominent English representative. As it was assumed that a high art picture could only be produced by foreigners, amateurs were convinced that Dutchmen alone were qualified for any commissions that were not given to Italians. GRINLING GIBBONS appears to have been a foreigner, although from the name it might be imagined he was a native of this country. The most that can be said of the Williamite period is that it preceded ANNE'S reign, and that it afforded signs of the decline of foreign art and of the coming of native art. It is not, however, necessary that favour shown to the fine arts should be a qualification for respecting a monarch. WILLIAM earned the gratitude of Englishmen, and we may still have hope that the figure which a kinsman is to set up in Kensington will be worthy of the monarch whose ambition it was "to make England the arbitress of Europe, the tutelary angel of the human race."

THE ASSOCIATION SKETCH-BOOK.*

THE latest volume of the "Association Sketch-Book" manifests that no less interest is taken in architecture by the young architects of to-day than was exhibited by the earlier contributors. The seventy plates in the volume are all evidence of zealous work, and in most of them are signs of a desire to express detail rather than to give slap-dash sketches, which save labour and are supposed to give general effects. It is evident that those who made the drawings are more desirous to increase their knowledge of form and construction than to display their skill as draughtsmen. The plates are therefore significant as evidence of admiration for old work, which is probably the best that could animate a student of architecture. The collection is also interesting as suggesting the inextinguishable wealth of England. Often as Mediæval and Early Renaissance buildings have been represented, it is still possible to find subjects in this country which are the attractiveness of novelty to most people. Many of the plates represent English work. The following examples are taken from Holland, Italy and France. The title-page, by Mr. W. C. GREEN, is an adaptation of the façade of a summer-house which now forms the entrance to the cemetery of the Roman Catholic Missionary College at Drumcondra, co. Dublin. The date is about 1775—a time when CHAMBERS and other English architects obtained commissions in Ireland—and it exemplifies English treatment of Classic elements. The first of the plates is a view of the west front of

Benham Abbey by Mr. W. S. A. GORDON. The lines are very carefully drawn, but the washes of colour have diminished the effect without imparting any advantage. There are five drawings of Canterbury Cathedral: Mr. McLACHLAN represents the very delicate colour decoration of St. Andrew's Chapel. Professor BERESFORD PITE gives one of his Piranesi-like views in the cloisters; while Mr. CHARLES THOMPSON supplies three measured drawings of the cloisters giving details of the groining. It is pointed out that the vaulting ribs are of white Caen stone with chalk filling in between. All the upper portion of the buttresses above parapets and the finials and crockets to the canopies have been destroyed. Mr. THOMPSON suggests restoration after remaining examples. Mr. GARRATT has two drawings from Cirencester. One is a bay in Trinity Chapel, and the other shows parts of the old town hall. Apparently the plates are reproductions of pencil drawings, and if the originals were made on the spot they are admirable examples of skilful plotting. The building is supposed to date from the beginning of the eighteenth century. The tile floor of Prior CRAWDEN'S chapel at Ely is shown by Mr. DRYSDALE. It is pointed out that "the width of the chapel increases from east to west from 13 feet 4 inches to 13 feet 7½ inches. No notice of this is taken in the design of the tiles." Mediæval craftsmen generally acted in a different spirit. The majority of the tiles had circles for ornament. But there were also heraldic lions and other figures arranged in bands. Old stables in Hastings, consisting of a house in the centre and a stable building on either side, the whole forming a continuous line, are drawn by Mr. HALL. The walls are of red brick with purple brick dressings, the roof of red tiles and the cornice of wood. It is probably an eighteenth-century building, and is a curious example of symmetrical arrangement carried to excess. Mr. HALL has discovered an interesting subject in the gate piers to Ickworth Park, Suffolk, which are supposed to have come from Bury St. Edmunds. They were, no doubt, originally intended to flank an approach on the skew, and therefore are out of place in their present position. Each pier is rusticated and has a fluted Tuscan pilaster. It is surmounted by a vase of rather novel form and of elegant design. It is an example of a kind of work which, from being liable to be overlooked, is well deserving of record. The doorway of Kilpeck Church is unlike most of the Norman examples in England in its ornamentation. Around the arch we see the heads, some beaked, which were an usual mode of decoration, mixed with forms which are novel. But on the piers of the doorway there is a strange mixture of serpents long drawn out, and warriors with mail corselets and bare feet who are enveloped with convoluted lines that run from top to bottom. In other words, instead of the "bits" which are often repeated, there is an effort to devise a composition that is adapted to a pier. The drawing is by Mr. JORDAN GREEN, who also supplies a large number of sketches from Lichfield Cathedral—indeed, the plate is overcrowded. Two plates from Muchelney Church, in Somerset, by Mr. F. C. MEARS, not only represent the fine tiles which have survived, but suggest a more orderly arrangement for them than is seen at present. They were relaid as they were found, regardless of the confusion, while it is evident from the plates that they could be grouped in a very effective manner. Mr. W. DATHY QUIRKE furnishes four plates of St. Nicholas Church, Old Shoreham. This is a well-known Süssæ structure, partly Norman, with a fourteenth-century chancel. One peculiarity of it is that the lines are not always laid out at right angles. The windows to the nave are very small, and it therefore rejoices in a dim religious light. The mouldings are simple, and there is comparatively little ornament in stone. The drawings afford a very complete representation of an interesting building. Tourists appear to attach so much importance

The Architectural Association Sketch-Book. Third series, No. 1906. Edited by William G. B. Lewis and Theodore Fyfe. (London: The Architectural Association.)

to the carved tie-beam, it is right to mention that it is duly represented. The massive brass lectern in Merton College Chapel, Oxford, appears in a drawing by Mr. W. S. A. GORDON. An interesting pair of drawings of figures from the rood-screen of Ranworth Church are supplied by Mr. W. DAVIDSON. One represents St. GEORGE and the Dragon and the other St. MICHAEL slaying the many-headed Dragon. The armour and costume are represented in a most laborious way, but as usual the dragons cannot excite terror. Mr. McLACHLAN represents the ornament found on some of the robes of saints in the same church, which probably was derived from Venetian or Eastern examples.

Mr. DE GRUCHY has some boldly executed views of Cornwall churches, an oak lectern from York and sketches of metal and woodwork. Sherborne Abbey is the subject of an excellent freehand drawing by Mr. DRYSDALE, as well as the Sherborne conduit or lavatory which once belonged to the abbey. By Mr. MEARS is an oak lectern from Shipdham Church, and Mr. LESLIE WILKINSON shows the roof of St. John's Church, Stamford, which is elaborately decorated in colour. Four drawings by Mr. H. F. TRAYLEN represent Burghley House, Stamford. Photography hardly does justice to so large a building, and it is an onerous task to undertake detailed drawings. One ingenious feature, usually absent from photographs, is the clock, which also serves to represent the arms of the noble owner. The views relate to the exterior. Two large drawings by Mr. J. HAROLD GIBBONS give details of the vaulting of St. Edmund's chapel in Tewkesbury Abbey. The projections are on a large scale and enable its character to be understood. Contours of the mouldings are also given. Although of limited size, the chapel was constructed with great care, and in the fourteenth century must have been a gem of architecture. Mr. MEARS has general views of the tower of Wells Cathedral, a work which is manifestly incomplete. Another, of the small church of St. Botolph, Westwick, showing the chancel screen, and of the Abbey Gate at Burnham Norton, on which it is stated that the window tracery has recently been completely destroyed by local roughs. Three careful drawings by Mr. JOHN SWARBRICK are devoted to the rood-screen from St. John, Bois-le-Duc, now in the South Kensington Museum.

GIOTTO's campanile at Florence is shown on two drawings by Mr. M. J. DAWSON; as one of them is from an elevated point of view, the background of landscape is suggested. The cloisters of San Lorenzo in Florence and the shrine of S. Miniato al Monte have been drawn with care by Mr. W. S. GEORGE. Mr. A. G. MAC-NAUGHTAN has a clever view of a part of the cortile of the hospital at Milan, the sculpture being skilfully rendered. No less effective are his views of the library of Siena Cathedral. Mr. L. ROME GUTHRIE has selected one of the old fonts in Siena Cathedral, which evidently is partly made up from an ancient candelabrum. Some of the rich embroidery in the cathedral has been drawn by Mr. McLACHLAN. The choir stalls of S. Giorgio Maggiore, which are most elaborately carved, were selected by Mr. L. U. GRACE. Mr. GASCOYNE's drawing of the interior of S. Maria dei Miracoli, Venice, excels the usual work of students by the management of light and shade. A valuable series of measured drawings of the building by Mr. PERCY M. LOVELL will perhaps be more appreciated by the majority of architects. The architect of the church—or at least of part—was PIETRO LOMBARDO. The character of the architecture will be judged from the following description on one of the drawings:—"Walls lined with oriental marble, varied with strips of grey African marble; balustrading, wall panelling, cornices, arch-moulds, strings round nave, altar rails, window jambs, &c., of Carrara marble; columns under gallery of Istrian marble; ceiling under gallery and barrel ceiling to nave panelled and gilded, with pictures in every panel." Mr. LOVELL's ten pages have probably never been surpassed for detail in the preceding sketch-books, and such an

effort should be enough to win him credit as a courageous student who is not daunted by size or quantity. Those who know Venice will say that he could have discovered a church more worthy of so much toil, but there may have been special reasons which dictated the choice. Mr. A. G. McLACHLAN gives three drawings from the cortile of the Ducal Palace. There are two views of the fascinating pedestal of the Colleoni statue by Mr. R. W. SCHULTZ. Lastly, Mr. JAMES McLACHLAN attempts to render the beautiful ornament of the Mihrab in the Mosque at Cordova.

The majority of the subjects, it will be observed, are difficult to treat. It is therefore satisfactory to find that the contributors have attained so much success. All are essentially architectural drawings. Volume X. of the third series is able to assert its worth with any of its predecessors. The editors, Messrs. LEWIS and FYFE, are, of course, entitled to a share of praise of which such a collection is worthy.

ARCHITECTURAL JOURNALISM.*

I DO not propose to indulge in personal reminiscences, though perhaps such a paper might pass the hour more interestingly than the precise programme immediately in view. From the Pugin-Barry controversy onwards it has formed part of my business to come into contact with a number of people more or less known to fame in the architectural world, and to hear an array of stories told about architects and professional concerns. Through flux of time, naturally enough, several of the opinions so expressed, and the experiences thus confided, relate to those who have passed away—men reckoned notable personages during the last quarter of the nineteenth century. The disinterested characters and kindly dispositions of some of these reminiscences are delightfully green in one's memory; a few, otherwise distinguished, exist far less pleasantly fresh in our recollections. I must relinquish what I could but think a considerable temptation thus to repeople the stage with old friends and familiar individualities, because we must not overlook susceptibilities likely to be wounded by a recapitulation. Tales, too, told perhaps at the expense of the living, might engender an affront with those whom it most concerns. The safer course, therefore, will be to omit all confabulations of this nature, and so I will commence my subject with an abstract proposition. What is the function of architectural journalism to architecture as a fine art; and is the influence by the professional Press conducive to its progress or not? *A priori*, the answer must depend upon two things, viz. a just understanding of architecture as now practised, and a proper appreciation of the legitimate sphere of journalism. It will, at starting, be incidental to our inquiry if we also briefly indulge in a little introspection. The modern architect has been ever concurrently with the growth of professional journalism the two have developed side by side. They appear inseparable, and certainly act and react each upon the other. We may do well, therefore, to make a note of that circumstance. Moreover, we cannot fail to acknowledge that the best architecture which the world has univ. all recognised was erected ages before the days of newspaper or professional architects, and most of it dates long prior to the invention of the printing press. The very name "architect" does not even appear to have been in use in England anyway till early in the sixteenth century, though it came into vogue rather sooner perhaps in Italy. "magister" was the designation given to King Henry II.'s restorator Mason Alnoth; and in the thirteenth century this title has been applied to others and equally to Pierre de Montreuil, whom records describe as the head of association of workmen engaged in designing and erecting the chapel of the Virgin at Saint-Germain des Prés, in which church he lies buried. An inscription on the south wall of Santa Maria Maggiore, Bergamo, names its designer "Magister" Johannes Campiglio, 1360. These worthy were salaried officials employed by patrons, however, but not appointed, of course, by county councils as functionaries. We have also to remember that the arts flourished in the highest forms unaided by academical displays or popular

* From a paper read before the Northern Architectural Association, Newcastle-on-Tyne, February 20, by Maurice B. de la B. F.R.I.B.A.

allery shows. The noblest triumphs of masterly building and the "supreme of earthly masonry" had grown mellow by age centuries on end before professors of architecture found a vocation or lecturers on art flourished on a syllabus.

We cannot too often repeat that texture distinguishes good architecture from mere building, and the journalist reiterates this fact, adding another as to the need of breadth and repeating the claims of good proportion with an insistence which is liable to be wearisome. But for all this humble endeavour, the petulant party who fancies himself in advance of his fellows turns round on the Press as if it could be held responsible for the inherent shortcomings of architects themselves. The complaint referred to implies that all pictorial prints are inadequate, or something worse; and so the journals are harmful and blameworthy.

It is hardly practicable to define the vocation of an architect with exactitude nowadays. The definition issued by the American Institute led to no little adverse comment, and we have not seen any attempt to fix the limitations of a technical journalist. Sometimes people fancy that he has taken up this kind of work, having failed at all else. The far-reaching influence of a nobly designed building is anyhow beyond reckoning, and the same too may be said of the power of a capable Press. If we assert that the English papers are second to none, it is perhaps no more than facts justify. No one realises the shortcomings of his trade better than the publicist, particularly if he should chance to be an adept in his craft. Whether architecture is recognised as chiefly replete with poetic possibilities, or is treated as a prosaic building business, to be enlivened only by the occasional contentious niceties of professional politics—to which ever side you attribute the most importance you are considerably indebted to the good offices of the journalist. This is sometimes not so fully acknowledged as might be expected, but in any event you will agree that we all owe a debt of gratitude to the enterprising secretaries of our several Societies for annually arranging their professional programmes and discussions, thereby adding to the dissemination of knowledge and the common stock of technical information. Public interest also in architectural matters is augmented in no small degree by these means, largely, I may add, by the help of the journals.

Now and again only, however, does it happen that some more venturesome spirit than the rest, gifted, it may be, with a nimble mind and presenting, perhaps, an attractive personality, propounds some paradoxical revelation, and to this end assumes a truculent air, riding a-tilt at generally accepted conclusions, and thus for the nonce unseats our common complacency and sets people thinking. A welcome ever awaits such an intellectual libertine, either in the press, in the pulpit or on the platform—one who can capably arouse the lethargic quintessence of his fellows and startle their latent powers of combativeness into activity. Nothing can be more dismal than to drone on, treating a daily task as a drudgery. Even the unrestrained prodigality of *L'Art Nouveau* obtained recognition as an attempt to emancipate applied design from antiquated senility. To preach with eripicity belongs not to the many, and to practise with distinction comes only to the few. Their little heaven must be looked to for the leavening of the whole lump. With this purpose the architectural Press stands for a good deal, and by its means the chiefs in the profession for the time being are brought into touch with the unseen countless numbers of inarticulate workers, who are thus influenced for the better. In a sense, of course, the immediate result perhaps is incomparable with the old traditional guidance which has for ever been lost. The patriarchal personal influence and primitive receptivity of the learner, too, are numbered with the past. The merit and variety of the illustrations comprise their chief interest and permanent value. But there exists beyond the scope of the immediate needs of the business of the architect, the surveyor and the builder a much wider question, as you will presently see, involved in the prosperity of the architectural Press. We need not stay to find the least common denominator in determining where the evils resulting from these periodicals commence or where their possible good may end. That knowledge would be of little use even if found. It is far more to the purpose to remember what Professor Armstrong said about the imminence of education:—"Interest is not always to be maintained at bursting point; in school, in the world, uninteresting work must be done sometimes, and in point of fact it is most important to acquire the art of doing uninteresting work in a serious and determined way." It would surpass the wit of man to make every number of any serial publication come up to one

invariable standard of excellence, and only when uniformity of deadly dullness sets in can it be said a just cause for complaint arises. A margin of merit must be conceded. And, further, in criticising the journals, as everybody has a right to do, people so often overlook the fact that things in which they chance to be particularly interested are the very subjects which others care nothing about, and *vice versa*. The best of us are apt to take too restricted a view, curtailing our energies to personal interests, and so overlook much that is going on around us. I doubt if even the most alert prognosticator can foresee or trace with any exactitude the precise goal to which all the educational activity of the present time is tending. Suffice for us to know that trades and manufacturing processes are being revolutionised, and amidst the immense potentialities of technical training are being extended and advanced both at home and abroad, thus influencing the destinies of nations after a fashion and on a scale unknown to previous generations. From whatever standpoint we view these things, they are beyond our control, and we shall do well to waste no time hankering after primitive traditional customs and patriarchal feudalism. The old order has become absolutely incompatible with contemporary economics, Fabian or otherwise. Our immediate concern is as clear as noonday; building workers must be brought into unison. Municipal trading schemes, direct labour undertakings and syndicate combines may do much, but they are not likely to corner the building industry just at present. County councils, like commercial trust syndicates, have, however, journals of their own to promote their own ends. The architect with an eye to coming events cannot afford to ignore the necessity of looking to his bearings, least of all to dispense with the journals of his professional class. His paramount influence as an artist is a very valuable and essential asset, convincing enough up to a certain point; but the only reliable footing upon which he may safely rely as a standby is his function and ability as chief builder and master of the works, qualified as a building expert capable of holding his own in the open market, equal to difficult constructional problems, economic modes of building, and able to protect his client's interests when dealing with enterprising contractors. All this is so well understood, and so mundane, that even a journalist might perhaps blush at such a recapitulation of the obvious. But for all that the architect must learn to wake up, and it is hardly necessary to remind him through you what a stupendous concern the building industry has become, and what a different affair the trade of a builder is now from what it used to be only a few years ago. Remember the multitudinous interests thus embraced and how many of them are individually antagonistic, competing in almost every grade in the stress of stern reality. The architect has the best of reasons for knowing what cutting competitors will do, and the journals are fully acquainted with the everyday struggle for existence. How is all this gradually affecting the architect? Engineers and specialists of every variety, including the so-called Guilds of Art Workers and Crafts, are all uniting in some way or another to wrest the architect's vocation from him and insinuate his end as a mere superfluity. The more affluent members of our profession may think lightly of such inroads, treating them as of no importance. Not so the rank and file, who can plainly see that this process which is being encouraged really means invasion in one direction and then in another, till one's opportunities become smaller by degrees and rapidly less, not only for "designing in beauty and building with truth," but in the meantime the architect's bread-and-cheese chances may be said to stand in jeopardy every hour. I am not a pessimist, but as a journalist attempt to put into plain terms what so many must have in their minds. It may be that what folks in Newcastle are thinking to-day the world will be thinking to-morrow.

Consider the position after a broad view of what is going on in almost every centre of activity with polytechnics, arts and science schools, crafts classes and trades colleges, all crowded like busy hives of industry, creating a throng of either co-operators with architects or competitors against them. No solution whatever will be arrived at by being supercilious, because the architect must become alive to the ultimate problem involved. He cannot afford either to ignore or stand aloof in this movement if he is to secure a hold on the wider issues of our national life. The professional journals constitute a much more intimate factor in this regard than perhaps may have occurred to you before, and it is evident that among the vast concourse of students and teachers comprehended in the higher educa-

tional scheme just alluded to, there exists an untold number of readers for whom the building papers have a very real interest.

Beyond this, again, there is the power of the Press in influencing public judgment, and often it would be impossible to obtain a hearing without the aid of journalists, who are said to hold the ears of king Demos in keeping. Modern intellectual, political and social life differs totally from the conditions prevailing in the days of the Plantagenets, and yet we are continually being lectured about the discrepancy of methods architecturally characteristic of the Middle Ages as compared with those of the reign of King Edward VII. Those who most harp on this string are the inconsistent people who never cease to caustically bemoan what they designate the inanities of the Gothic Revival. These also are the critics, too, who say that the architectural papers only serve to make the cribber's repository replete with an ever-increasing choice of patterns, and mostly bad ones at that, because, forsooth, the aforesaid candid grumblers mostly keep their own precious productions to themselves. Thus, on their own showing, they never give the reader even a rare chance of seeing how things ought to be done. This criticism about cribbing leaves my emotions quite untouched. I have seen too much of it done by every variety of architect, "twixt wind and water," to be moved on that account, and my experience is that those who make the most fuss about giving their brains to other people are the last persons in the world who run any real risk quite in that way. By continually publishing the best contemporary drawings of the most successful buildings, and in illustrating the designs chosen in current competitions, the professional periodicals serve an unquestionable service, to say nothing of the historic examples of all kinds so copiously given as standards for reference. This dissemination is not limited by any means to the cities and big centres of enterprise, seeing that individuals living in the most remote places are reached almost as readily, while architects and subscribers in our Colonies have again and again told us how they look forward to see the journals as the mails arrive.

We, too, at home, by the same means, are made acquainted with what is going on beyond the seas among our fellow workers who are engaged in developing countries in which many of our sons will have to make a home. It has often occurred to me how remarkable it is that equally able individuals should entertain such diametrically contrary opinions about the merits or otherwise of the self-same thing. There is, I suppose, no accounting for people's tastes. What a humdrum pellicle of a place this "valley of tears" would be if we all thought alike. Our journals would be duller than they sometimes are already. Much of their space is necessarily occupied with ephemeral matter answering the fugitive needs of the hour; but you will do well to note that, whatever power the Press may possess, it cannot make insignificance significant. I mean these papers have in the main to be recognised as records of other people's doings, and they reflect the best that is being produced at the time. On the whole this agreeable task is well performed with a catholicity of selection, a regularity and an impartiality which at least commends itself and pleases the majority. There always remains a residuum who would like to have a paper all to themselves, and I dare say think they would do great things. Judged by an academic standard, or looked at through the barnacles of a cult, some of the illustrations are mediocre enough, it is true, unrelieved by freshness or artistic charm; but obviously great designers can be counted on the fingers, and distinguished works of art necessarily are few. An annual magazine might have leisure to collect and pick out the supreme, eliminating everything which does not count as excellent, though I doubt it. Somehow good, bad and indifferent performances gain equal publicity anyhow, and this is precisely the distinguishing characteristic of each Royal Academy show, as in every other exhibition. The work of the most capable man even is unequal, and occasionally most disappointing. Weekly journals are primarily newspapers, and you cannot reasonably compare them with expensive magazines; but no monthly publication can compete with them in the matter of large circulation and thorough representation of up-to-date form. In passing judgment upon the relative value of any illustrations, it is clear that, though the subjects may lack artistic merit, they probably present an interest of another kind, perhaps as a planning scheme or some special kind of building of exceptional value to one class of

reader, but of little use to another. The journals are very much what the profession is capable of making them.

As years come and go, the gigantic growth of serial accumulations is inevitable, and many ingenious subscribers have endeavoured to cope with this vast aggregation by devising indices and file compendiums of their own with a view to classification. Perhaps the index printed with a paper every half-year furnishes, after all, the best means for reference, and when bound in a small folio such indices are easy of access and can be cheaply preserved. Nothing could be more hopelessly unmanageable than a lot of bundles of unbound parts of any periodical. It must be largely composed of inconsequential matter; but, on the other hand, these volumes do contain considerable information which cannot be found elsewhere. The great point is to keep the indices for ready application so as to make the information accessible.

The lecturer, after recording the publication of architectural publications since 1786, said:—With regard to continental publications, it has to be noted that the strict rule of annual subscription mostly obtains, and under this régime individual copies are not supplied to non-subscribers. In England and in America readers have the option of purchasing any particular number or part of the periodical they may fancy. This no doubt is a great advantage to the public, but the publisher has to determine the limit of his editions by the average demand; consequently any issue which happens to prove specially popular speedily runs out of print. Other numbers less in demand lapse into "waste," which results in a loss to the proprietors, beside being the indirect occasion of loss to the readers, and for this reason the output on every periodical necessarily is calculated upon a provision as near as may be to cover the depreciation inevitably accruing under such a system. On the other hand, when the edition of a serial is defined by regular number of annual subscribers, as happens on the continental plan, this loss is obviated, leaving more available capital expenditure on the improvement of the publication itself. The conduct of any journalistic enterprise obviously must be based upon commercial consideration unless, of course, the publication is run to further particular views or ulterior aims of the proprietor. This is not likely to apply to the architectural Press, which, like any other business enterprise, is founded on the principle of supply and demand; but there is this to be said, that those who really value the paper which represents the interests would do well to remember how this aspect of the matter concerns the reader as well as the proprietors—least to this extent, because success in furthering the end for which both the architect and the architectural journal are working must largely depend upon the co-operation of the subscribers to these periodicals, not only by contributing to their pages and, as correspondents, giving ear and information of matters of general interest, but by regular taking in their papers. I make no apology for thus coming to so conclusive a point, which otherwise might not occur to you. Class journals do not appeal to the public in the first instance, though their opinions are constantly quoted in the popular newspapers, thus materially assisting the aims and interests of the community which the architectural journals more immediately represent, and it is primarily on their own constituents that the professional periodicals must rely for support.

EDINBURGH ARCHITECTURAL ASSOCIATION AND HOLYROOD ABBEY.

A MEETING of the Edinburgh Architectural Association was held last week, Mr. Hippolyte J. Blanc, R.S., president, in the chair. The subject to be discussed was the restoration of Holyrood Abbey.

Mr. James Bruce, W.S., moved:—"That looking to the public interest that has been aroused on the question of the repair and restoration of the chapel royal, Holyrood, through the intimation of a legacy of 40,000*l.* for these purposes by the late Earl of Leven and Melville, the Council be remitted to the Council to report upon the following points, viz.:—1. What remains of the structure exist. 2. The condition and capabilities of the parts remaining. 3. Whether the evidence of these parts is sufficient to enable a satisfactory repair and restoration of the structure to be made." Mr. Bruce said that if the Council took up the subject they would be rendering a service not only to the architectural profession, but a great service to Scotland. In a matter of that kind it was right that the subject should be dealt with by those who were trained architects. The subject should

get the best service that it could get, and get it impartially. What they wanted to know was, what is the real state of matters with the old abbey church of Holyrood? Looking at what appeared in the newspapers almost every day, one saw how wide was the interest of the Scottish people in this matter. Holyrood Chapel was one of the most interesting, if not the most interesting remaining building that they had in Edinburgh of that extremely early date. In some respects, both in architecture and in its intimate connection with the royal family of the country and with the history of the country, it occupied in Scotland a position somewhat analogous to that of Westminster Abbey in England. Lord Leven left the great bequest of 40,000*l.* to have the old church put into a certain state of repair and restoration and the parts that were missing completed. He left that money to his trustees, and he directed them to apply to the King for permission to make the repairs. So far as he knew the trustees had not approached the King, and the matter now stood in this way, that Lord Balcarres and Sir John Stirling-Maxwell, who were asked in the will to see to the execution of the work by an architect named by his Lordship, had written to the newspapers saying that they had got a report from Professor Lethaby declaring that restoration and repair was practically impossible at Holyrood. Of course, it might be so. He as a layman could not tell; but he might say this, that when these old walls, which he had looked at so often, were 10 feet thick, it seemed inconceivable that restoration and repair would wreck what yet remained. If interfering with the remains in an attempt at restoration and repair were to bring the whole thing to ruin, he said that no one in Scotland would think of lifting a hand in that direction; but if, on the other hand, it were found that there was a large amount of remains still standing, that these remains were in a fairly satisfactory condition, that what there was of them could show accurately what had been lost, and that it could be made sure that the proposed work would not bring ruin to what now existed, then he thought it should certainly be done. For himself, if he thought the restoration would be a restoration such as the outside of St. Giles's, he should say that it ought not to be done. On the other hand, if it were a restoration such as that of the inside of St. Giles's, then he said it should be done. If a committee presided over by Mr. Blanc said that the thing could not be done, then he was afraid they must just accept with great regret the verdict that came from them. If, on the other hand, the committee thought the thing could be done and done with safety, he was sure their report would be hailed with very great pleasure.

Mr. Daniel Macfie pointed out that at the last meeting of the Association he said that by delay nothing would be lost out time. He now felt that nothing had been lost, because it seemed to him that the interest on the part of the public had increased. The feeling was very widespread that the matter should be examined with thoroughness by those who were expert in that kind of work. He believed the Association would practically efface itself if it declined to do anything in the way of inquiry. The Association existed for purposes of that sort as well as other matters of public interest generally. He did not think that timidity, or any less worthy sentiment, should animate them in discussing the question. The Council would undertake a work of very great responsibility, and if they took it in hand he was certain that some good guidance, some proper leading, would be given to the public.

Mr. H. O. Tarbolton, in supporting the motion, said the attitude of the anti-restorationists had been characterised as nauseous sentimentalism, and it had also been said that all competent architects were entirely in favour of the restoration. With regard to the first point, would they say that it was merely "nauseous sentimentalism" to show hesitancy in patching up an old master, or in protesting against, say, the restoration of the Parthenon? With regard to the opinion of architects, there was, he said, a very wide divergence of opinion in the matter all over the country. He believed that architects who were opposed to restoration were animated by the most sincere motives. They felt that it was their professional duty to maintain and preserve such precious treasure, which through, perhaps, over zeal was in danger of being threatened. There was another point. They should clear the ground entirely from any suspicion of jealousy in the matter. He hated the word, and he could not express his indignation to think that it had been used in regard to an architect of the reputation of Mr. Ross. He believed he was expressing the opinion of every architect in the country when he said that Mr. Ross had their entire

sympathy in that unexpected and unprecedented contretemps.

The President said that the remit had not been brought forward for the purpose of controversy. Nor was the intention one of trying to interfere with Lord Leven's will, nor yet to controvert Professor Lethaby's report. He felt that the public naturally looked to that Association to give them leading and guidance, but whether it were that that leading would be in the direction of recommending that nothing should be done or that something should be done, it would be premature to speak now. The intention was to place before a number of intelligent architects in Edinburgh and in Scotland the circumstances as they existed, and to complete a carefully studied examination, followed by a report. That report would be placed before the Association when matured by the Council. It was their plain duty to inspect the remains and to ask the Council to deal with the matter at the earliest possible time.

The motion was adopted unanimously.

The following communication has been addressed to Lord Balcarres and Sir John Stirling-Maxwell, Bart., by the Scottish Patriotic Association:—At a meeting of Council held on February 15, resolved respectfully to draw the attention of Lord Balcarres and Sir John Stirling-Maxwell, as superintendents of the restoration of Holyrood Chapel under the will of the late Earl of Leven and Melville, to a fact which has hitherto escaped notice. In the report by Professor Lethaby the chief point urged against the restoration was that if restored the chapel would no longer be the fane with which so many historic events have been associated. The Association would point out that the chapel had already been twice destroyed and twice restored before it fell into the ruinous state in which it now lies. It was unroofed, despoiled and thrown down by the English General Somerset after his victory at Pinkie in 1547. The nave was restored as a chapel royal for the marriage of Queen Mary and Lord Darnley in 1565. It was again destroyed by the Earl of Glencairn after Queen Mary's flight from Borthwick Castle in 1567. It was again restored when the modern part of the palace was built for the use of the Duke of York, afterwards VII. and II., in 1679. And it was destroyed once more at the Revolution in 1688. In view of this history the Association would point out that Professor Lethaby's suggestion that restoration would deprive Holyrood Chapel of its character as an ancient monument loses its point. The chapel has been restored several times already. The same argument against restoration would have applied to the cathedrals of Glasgow, St. Giles's, Dunblane and Iona, and the abbey churches of Paisley and Culross. For this reason, and because of the superlative interest which belongs to Holyrood Chapel as the scene of historic events and the tomb of several Scottish kings, the Scottish Patriotic Association respectfully urge Lord Balcarres and Sir John Stirling-Maxwell to reconsider their decision not to proceed with the restoration.

We understand, says the *Scotsman*, that under the provisions of the late Lord Leven's will, the money which he conditionally left for the restoration of Holyrood Chapel falls into his residuary estate, which is directed to be held upon various trusts for Lord Leven's sons, none of whom are yet of age, and their unborn children. This provision, it will be observed, makes it impossible for anything being done in the way of the beneficiaries renouncing claim to the 40,000*l.* in order that it may be used, outside the terms of the will, in rebuilding the choir as a chapel for the Knights of the Thistle.

A Statement has been issued from the Bradford city architect's department showing, in accordance with the instructions of the finance and general purposes committee, the average annual cost of the department and the average annual approximate value of services, calculated upon the basis of professional fees recognised by the Royal Institute of British Architects. The averages for the year are in both cases based on figures for the five years ended March 1906. The statement gives the average annual cost of the department as 1,630*l.* The average annual value of services of the department calculated upon the cost of works actually carried out is stated to be 2,196*l.*, and the annual value of services not yet carried out to be 1,007*l.*, making a total value of 3,203*l.*, and leaving a balance over cost in favour of the department amounting to 1,573*l.*

NOTES AND COMMENTS.

THE Tolbooth of Dundee was erected in 1734 by WILLIAM ADAM, the king's mason, and the father of the three brothers who left their mark on London streets. A building which suited the needs of Dundee at that time is not equal to those of a later period. The population of Dundee is now at least tenfold what it was in 1734. It is therefore proposed to preserve the present building in High Street, but to remove the structures which are contiguous to it, and on their site to erect city offices and a city hall. The estimated expense of erection and site is 140,000/. But a smaller scheme only works out at 60,000/. It is anticipated that people who are or have been connected with the city will be generous in giving donations, and it is also contemplated to let a part of the property. It will be necessary to obtain Parliamentary powers to carry out the project, and as there is no urgent demand for the change the following resolution has been adopted, which does not commit the Town Council to any immediate expenditure:—"That this Council approves in general of the terms of the scheme for a new town hall and council chamber, and remits to the Lord Provost's committee to consider its details, and resolve on what is necessary to be done for its accomplishment after fully considering the whole matter, and after ascertaining to what extent the new town house and council chamber as a public scheme will secure the support of the citizens."

THE question has often been asked why the Académie Jullian was such a success. There are many establishments of the same kind in Paris, but in none of them was it so difficult to obtain a sitting. JULLIAN's somehow had gained a universal reputation, and young fellows from many lands could be seen in the great quaint gallery. RODOLPHE JULLIAN, who was the head of the establishment, has just passed away in his sixty-sixth year. He was a painter, and that perhaps was one of the reasons for its success, for some academies were originally organised by models and other men connected with art, though they could not draw or model. The number of students during the last thirty years would be surprising to a foreigner. Some of them are to be reckoned among the foremost French painters. As in other schools, JULLIAN was able to obtain the aid of men whose slightest word of praise or reproof was treasured, and he was an excellent organiser. But probably the success of the place was mainly derived from the independence allowed to the students.

THE committee seeking contributions for the preservation of the Auld Brig of Ayr have been fortunate in obtaining 9,500/. already, and additional sums are expected. The Town Council fixed the sum required for the works at 10,000/., and the committee have not only guaranteed that amount, but have agreed to pay more if necessary. The bridge is therefore likely to be handed over to the committee without delay, especially as Messrs. SIMPSON & WILSON, the engineers, are desirous to have the works commenced in order to be completed in two years. Mr. JOHN YOUNG, the burgh surveyor, has an onerous task in dealing with enthusiasts who look upon every stone of the structure as sacred, although decay is evident. His report on the proposals is a model of caution. In the course of it he says:—"If the anticipated conditions on which the success of the proposed works are based turn out altogether favourable, the proposals now submitted form a practical scheme for the preservation of the present fabric of the bridge. It is meantime, however, out of my power to definitely assure the Town Council that the proposed works will be entirely successful, or to forecast their effect on the permanent security of the bridge, as so much depends on the manner of carrying out the works and the methods adopted for overcoming the difficulties and problems met with in its execution. I must therefore

ask that, until the works are completed, my definite assurance in regard to the security of the bridge for public traffic may be deferred." There is so earnest a desire to have the old bridge put into a condition which will make it a memorial of BURNS for many a year, the burgh surveyor will, it is to be hoped, find no difficulty in passing the works as secure.

A NEW series of by-laws will shortly come into operation in Manchester. The improvements committee who prepared them sent a draft to the Manchester Society of Architects and the Builders' Association with a request for suggestions. The Society of Architects, having considered the by-laws, made some observations upon them which were adopted as far as possible by the improvements committee. But the members of the Society expressed their regret that in consequence of August being a general holiday period they had not had time to go fully into the matter, and if further time could be granted they would go into the subject again in detail. No other opportunity was given for further consideration, although it appeared to be a general opinion that the by-laws had been approved by the Society. The chairman of the improvements committee said that while they were desirous to work harmoniously with the Society, it could not be accepted as a court of appeal, and he considered that the time allowed for the architects or any other person to offer suggestions was ample. As architects will have to carry out the by-laws, it is to be regretted that there was not co-operation between the Society and the Corporation.

SOUTH KENSINGTON is likely to be soon enriched by the erection of a Technological College on a scale which will correspond with the requirements of the present time. We have already explained the proposals, which were the result of the investigations of a special departmental committee. The London University, it was suggested, should accept responsibility for the educational arrangements. It was also recommended that there should be a governing body of forty members, six of whom would be appointed by the Crown, four by the Board of Education, five each by the University of London, the London County Council and the Council of the City and Guilds of London Institute, four by the teaching staff of the new institution, two by the Exhibition Commissioners, one each by the Royal Society, the Institution of Civil Engineers, the Institution of Mechanical Engineers, the Institution of Electric Engineers, the Iron and Steel Institute, the Institution of Naval Architects, the Society of Chemical Industries, the Federated Institution of Mining Engineers and the Institution of Mining and Metallurgy. It is now understood that the President of the Board of Education will introduce a Bill in the present Session by which power will be sought for the creation of the college.

LEYTON LIBRARY.

THERE can be no question about the revival of artistic joinery in England. Mr. CARNEGIE can claim that he was one of the inspirers. In the oldest libraries, work of the kind was considered to be indispensable, and it cannot be superseded by any modern invention in recent institutions. The extensive scheme which Messrs. NEWMAN & JACQUES have made of joinery in the library at Leyton imparts a character to the interior which is satisfactory. In carrying out their design, Messrs. ELLIOTT, of Newbury, have loyally co-operated with the architects, with the result that the rooms have lost that coldness which deters students and readers, and have acquired warmth and homeliness.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. Leonard Stokes, vice-president, in the chair.

Mr. ALEXANDER GRAHAM (hon. secretary) announced the decease of Sydney Fowler, elected Associate 1882; William Angelo Waddington, elected Associate 1882 and Fellow 1903; W. A. Large, Fellow, elected 1904, district surveyor of the Belgravia district of Pimlico and St. George's, Grosvenor Square; and A. Maryon Watson, elected Associate 1899, who was the Institute essay medallist in 1901. Mr. Watson was the only son of Thomas Henry Watson, and had taken an active part in the work of the Institute, being for some years one of the hon. secretaries of the literature standing committee; the deceased had also been one of the hon. secretaries of the Architectural Association. Papers were read by Sir CHARLES NICHOLSON and Mr. C. CORLETTE ON

Modern Church Design.

Sir CHARLES NICHOLSON, in opening, acknowledged our indebtedness to recent writers and lecturers on modern church building. Just as Pugin and Beresford Hope in the middle of the last century were instrumental in killing the Gothic style of the Peel churches, so later critics have put an end to the fashion of imitating the eccentricities of men like Butterfield or Burges in buildings which lack the grace and sense of proportion which give distinction to the works of those masters.

Touching the smaller and simpler types of churches, a factor which the architect should bear in mind when designing such buildings is the necessity for restraint and simplicity. Generally the builder of a small church is only justified in aiming at that kind of dignity which can be obtained by simple outlines and good proportions. Delicate ornament and bright colours are not out of place in such buildings; but an undue multiplication of parts, an excessive parsimony of material, or the use of meretricious ornament can only result in disappointment. A refined sense of proportion or detail cannot be equally attained by all; but we can at any rate build simply and without offence, and refrain from aping the features of a cathedral upon the scale of a chapel.

The importance of a simple plan cannot be over-estimated in our smaller churches, and in such buildings it is not always necessary or desirable to sacrifice too much for symmetry. Thus, under certain conditions, good results can be obtained by planning a moderate-sized church with a nave flanked by an aisle of fair width on one side only. Proponents of church-building schemes are apt to make a fetish of an unobstructed area full of pews in front of the chancel and altar. There is no real necessity to place the altar and chancel in full view of all the worshippers, especially when everybody possesses a Prayer-book and can read it. The question of placing the pulpit in a conspicuous position, and of making the preacher audible to the congregation, can generally be solved in a church divided up into bays of reasonable width, and carried upon fairly light piers, especially if the continental and old English plan adopted of placing the pulpit about a third of the way down the nave, so arranging the seats that those placed east of the pulpit should be capable of being turned round during the sermon.

Although the passage-aisle type of church is capable of producing imposing architectural effects, these are only possible where the height is ample; the plan is therefore mostly one, and unless ample funds are available it is better to adhere to a more economical type of design. The effect of internal spaciousness can be best attained by dividing up a church into two or three spans of fair width and height, rather than by exaggerating the dimensions of a central avenue and tacking on a pair of aisles like stage sculleries.

Speaking of the value to the architect of a true sense of scale, the author referred to the many Renaissance buildings, like St. Peter's at Rome and the Isaac Church at Petersburg, which suffer from the exaggeration of their details. Our own besetting sin is in the reverse direction, for we are apt to destroy the dignity of a whole by supposing it of a collection of features so small as to be lost in themselves. The work of men like Street and Butterfield is generally marked by a fine sense of scale in individual parts. Some of the best effects in modern church work have been produced in simple buildings by the use of thick walls, ranges of large windows, full arcades and plain roof lines.

A problem often presented to modern architects is the production of cheap town churches of good size, seating up to a thousand people or so. By exercising great care and economy it is still possible to build substantial churches fairly cheaply; but in such buildings it is only possible to attain simple effects which do not commend themselves to public taste, and it is only by the exercise of some diplomacy that an architect compelled to build cheaply is excused from the obligation to disfigure his work with poor ornament. Under these conditions it is advisable to aim at actual bulk rather than at architectural refinements or luxuries; and such unessential features as chancel arches, clerestories, broken-up roofs and an undue multiplication of parts should be dispensed with.

The one difficulty which cannot be dispensed with in these plain churches is that of sufficient solidity. In cheap modern churches, when the construction is starved until the verge of stability has been nearly attained, one cannot but feel a most painful sense of pretension and inappropriateness. If we have to build cheaply, let us, at any rate, build solidly, and not waste money upon moulded dressings of Bath stone or even baser materials.

As regards external design we should be content with the simplest possible outlines and with the severest of detail. One source of dignity is within the reach of every church builder, viz. a long, unbroken roof line. It is hardly possible to over-estimate the value of this; but it requires a certain amount of courage in the architect to compass the building of such a roof. What is true of a roof line applies also to a parapet, whether plain, pierced, embattled, or pinnaced.

The author referred to the mistake, so often made by church building committees, of under-estimating the possible requirements of their localities. Instead of laying-out a sufficiently large scheme at the outset they aim at getting a church finished quickly to hold six or seven hundred people, trusting to supply future needs by the erection of mission or district churches as the population grows. This is a great mistake. The organisation of a single large church is generally more efficient and less costly than that of a number of smaller ones. In a large town church, well equipped and well staffed, it is possible to maintain a constant succession of services with the same expenditure of labour that is now dissipated in the simultaneous performance of services in half a dozen small churches. Architecturally, it is evident that one good building is worth any number of indifferent ones. It is bad economy that some dozen churches within a radius of a mile should have exactly the same service going on in them at eleven o'clock every Sunday morning; the clergy are overworked and underpaid, sermons are only half-prepared, churches are half empty, and church music is often of a vulgar and sensational character. The author thought this condition of things might be remedied by imitating the generous ideas prevailing in some of the continental towns, where modern churches are built, cross-planned and vaulted throughout, varying from 180 to 200 feet in length and from 60 to 80 feet in internal height.

As regards the style of our churches, the author referred to the fashion of deriding modern Gothic. Our Gothic school, he said, is by no means seeking merely to reproduce the effects which it was only possible to obtain under conditions which no longer exist. Perhaps it is because the conditions under which later Gothic work was done were more nearly approximate to those of our own time than the conditions which obtained during and before the thirteenth century, that the most successful modern Gothic work is based upon late rather than upon early examples. But it will be conceded that the type of work which has been developed from the late Gothic models has grown up into a fairly well-understood manner of architectural expression, which is both modern and English and church-like. This being so, asked the author, is it worth while to cull Byzantine or Classic details for the sake of mere novelty, or to imitate or invent features which are merely picturesque, quaint or even grotesque? Surely it is wiser to recollect that fashions which are merely odd are bound to change rapidly, and to devote our superfluous energy to the perfecting of planning and the development of construction. The secret of Bentley's success at Westminster lies in its solution of such problems as the construction of a fireproof roof system and the possibilities of vaulting a large building in concrete, and not in the clever compromises between Classic and Byzantine detail with which his work is adorned. And the wholesomest fruit of the Gothic revival is to be found in the series of vaults which Pearson poised

with consummate skill over many of his churches, rather than in the miles of correct thirteenth-century Lincolnshire mouldings with which he covered his cathedral at Truro. Under the influence of the Church of England the Gothic style can scarcely be said to have been entirely disused at any period in this country.

The spirit of the Church is distinctly conservative and traditional, and in a sense still Mediæval, and it is not unnatural that our church architecture should reflect this tendency. Moreover, churches like St. Michael's at Coventry and St. Nicholas's at King's Lynn, and scores of others, form models for town churches which would fulfil every requirement of the present day, for they are the best compromise that has yet been evolved between the conflicting requirements of ample accommodation, good acoustics, practical comfort and architectural dignity.

Mr. HUBERT C. CORLETTE, treating of the practical requirements of a church which should be satisfactory both ecclesiastically and architecturally, said that first the building must be suitable for the locality in which it is to rise. It should be quiet and dignified, and it can be both of these without being mean and bare, even though no mouldings, carving or other decorations are possible. The levels of the site, the course in which the drains may fall, the nature of the subsoil and the foundation with which it will be necessary to deal are elementary matters which cannot be overlooked. But if the work is to be part of the locality in which it is to be built, the characteristic type of work which has been the pride of the neighbourhood for centuries, the local materials available and the capacities of local craftsmen should be considered as well. To use the bricks, tiles or slates, the stones, the sand, or any other materials which are parts of the surrounding hills and valleys is but to make the work a distinct portion of the soil upon which it is to stand. The local types should also be studied so as to get a distinct idea of the way in which one may best work in touch with tradition.

Dealing with the question of accommodation, the author subdivided his subject into (1) The sanctuary:—*a*, altar; *b*, reredos; *c*, steps; *d*, altar-rails; *e*, sedilia; *f*, piscina and credence; *g*, altar and sanctuary lights; (2) The choir:—*a*, reading-desk; *b*, choir-seats; *c*, lectern; *d*, steps; *e*, screens; *f*, organ; (3) The nave:—*a*, seating; *b*, aisles or passages; *c*, porches; *d*, narthex; *e*, font; *f*, pulpit; *g*, litany-desk; *h*, floor levels; (4) The side chapel; (5) The vestries, sacristy, cleaner's room; (6) Lighting, heating, ventilation, drainage, roofs, musical considerations.

Experience has shown that the mensa, or slab, the table-top, which is the altar itself, apart from its supports, should not be less than 7 feet by 1 foot 8 inches. But 8 feet is better as a minimum length; and the top of the altar-stone should not be less than 3 feet 3 inches, nor more than 3 feet 6 inches, high above the foot-pace or platform upon which it stands. The altar should be so placed in the sanctuary that the length of it is north and south, with the long sides towards the east and the west. The altar need not be so placed as to be in full view of the whole congregation. But it is not desirable that it should be altogether hidden and screened, as seeming to exclude the worshippers who are present to take part in the service of the Church. The altar should be raised above the level of the nave floor. In a long and generally large church it may with advantage be higher than in a small and short one. There should be one step, and one only, at the entrance to the sanctuary from the choir.

The reredos gives opportunity for the use of some of the highest forms of artistic expression in colour or form. In it the architect, painter and sculptor, the carver and worker in metals, may use all their best faculties and ideals in producing a work of admirable architectural beauty. In its simpler forms, the dorsal or hanging with side curtains may be used.

If there is unlimited room, and a really fine sanctuary may be had, let it be large. Then the altar and platform may be well detached from the east wall and stand forward with advantage. There may be the steps close to the platform, returned round it, with a wide space between the lowest of these and one or two carried across the entire sanctuary. On the other hand, if the site is in a town, it may be confined, and a limit placed upon the space available for a sanctuary. If this is so, everything should be done that is possible to make the sanctuary worthy of the object for which it is used. But it must be convenient, useful first, and dignified. All actually unnecessary steps should be discarded.

The true place for any distinction between one division

of the church and another is at the entrance to the sanctuary not at the entrance to the choir. If anything in the nature of a chancel arch is used, let it be placed above the entrance to the sanctuary. The screen might then be placed there on a step above the choir floor, and the altar rail at a convenient distance 5 or 6 feet eastward of this. This would be a suitable position for the rood-screen in a moderate church with a choir of laity.

The custom of placing the lay singers in the chancel between the nave and the sanctuary is an innovation. But as it has so largely been accepted, architects must deal with it as well as they can; and one thing necessary will be to arrange that the benches and desks for the choristers should not be too obtrusive. The long lines of them are valuable architecturally to lead the eye on to the altar. But it is wise that they should not appear as a too prominent break between the nave and the sanctuary. The best way to avoid this is to keep them lower than they are sometimes designed.

If the choir is to be raised at all above the nave floor level, it will undoubtedly be best that all the steps should be collected together at the entrance to the choir from the central passage of the nave. It is not, however, necessary that the choir should be raised. But when it is lifted up from one to three steps of 6 inches rise and 12 inches tread will be quite sufficient.

Discussing musical requirements, the author advises that the organ should not be enclosed within a brick or stone box of building materials, even though one might make it an excuse for introducing a tower. The organ in the church for practical reasons, and should be placed where it can be used. It should also bear a distinct relation to the size of the building, and not be too large for the church in which it is placed.

As regards seating there are well-defined and generally accepted rules which need not be departed from. In setting out the area for seating the simplest method is to allow 3 feet from back to back either of benches or chairs. The author favoured chairs as the best solution of the difficulty of disposal of hats. If the back legs of the chairs are well planned a convenient place for hats is to be found between each chair. The hats can be shelved upon the bottom rungs of the two chairs, or upon a flat piece of board screwed to the rungs to receive them.

In even a small church the central passage of the nave ought to be no less than 4 feet wide; it is better to be at least 5 feet or 6 feet. Side passages should not be less than 3 feet in width, however small the church may be. If the side passages are in aisles in which there is seating other than that properly in the nave, it will be necessary to make them 4 feet wide. The cross passage between the seats in the nave and the western limit of the choir may be 4 feet across, if it is not likely to be used extensively. But if the choristers approach the entrance to the choir from the vestry by this passage it should not be less than 5 feet or 6 feet wide. The cross passage at the west end of the church should be regarded more as a narthex, or internal western porch, than otherwise. And it might be screened from the nave, even only by curtains above the backs of the last rows of seats.

If ample space is allowed at the west end there will be room not only for ingress and egress, and the placing of the font as an important essential of the plan, but it would also, perhaps, make it possible to provide some convenient receptacle where umbrellas, sticks and superfluous coats, wet or dry, might be deposited.

In allowing for the pulpit in the plan the first requirement is that it shall be so placed that the speaker may be heard well in any part of the building. It is in England usually found on the north side, not far from the entrance to the choir; but in a large church it might with advantage be somewhere near the centre of the nave, on the north or south side, close to the wall or arcade of the church. It will be sufficient if the floor of the pulpit be raised no more than 3 feet above the nave level in a church of moderate dimensions, but it may often with advantage be higher than this, especially if it is to be used for speaking to a large congregation. In this case a sounding-board above the pulpit is an advantage. The steps up to the pulpit are better hidden behind it than shown too much, and in no case ought they to be awkwardly arranged with any twist.

In nearly all well-equipped churches it is considered necessary to provide a small side chapel. It is used principally for the small congregations which attend the weekday services, and need not be a distinct portion of the building, but be separated by a screen from the body of the church.

Generally two vestries will suffice—one for the clergy and one for the choristers. They should be close together. And it is often convenient if the two may be thrown into one for the accommodation of any meeting or classes connected with the affairs of the church.

As regards the heating and ventilating of churches, each building will need special consideration, but the architect and signer of the whole work must control the installation and arrange for it, otherwise the architecture must suffer.

The author entered into the question of the cost of building churches, and showed that cheap churches are possible provided simplicity in design is followed.

Having considered the more practical matters of church building, the author recurred to a suggestion he had made earlier in his paper, that the various forms and furniture, and the disposition of the main parts found in use in a modern church, are not arbitrary customs or conventions. These forms, ceremonies and rites are all vital things. They have a meaning, a reason for their being and a history. They are formalities only when in the use of hypocrites, and they are neither based upon dead traditions nor the conventions of any real or supposed Mediæval empiricism. At the same time, though they do not owe their continued existence and use to a conservatism which will not advance, we must not allow them to be lost through any desire for progress which is neither reformation nor restoration, but rather revolution. There are, then, evidently guiding principles in church planning and arrangement, as there are guiding principles in building which we must remember." The author went on to recapitulate the principles underlying the traditional methods of church planning, briefly outlining the practice in England since early Christian times.

Concluding, he said that it was too much assumed that anything would be suitable as a design for church work in England now unless it had the sanction of English tradition manifest in its every feature and detail. Had not, however, certain types of design been made English by use? Had not some of the now essential elements of English design just been imported and then by the work of some generations of designers made ours by numberless experiments in the course of centuries? It appeared to be thought that it was "incorrect" to mingle Eastern with Western ideas of construction as a foundation of architectural design. But the Mediæval builders were hampered by no such absurd respect. In the South of France and in Spain the designers, though revelling in the same magnificence that height gave them, enclosed their whole floor area with one enormous vault. The grandeur of one large open space appealed to them in the clearer southern light as the broken mysteries of numberless supports satisfied in other ways a northern imagination. Because the domical experiment was not tried in England before the close of the fifteenth century, we were to be for ever debarred from using it in a design coupled with more ordinarily Gothic principles of structure? Or nearly two centuries the round arch and no tracery was essentially, if inevitably, a strong and beautiful element of our English Gothic art.

Mr. G. H. FELLOWES PRYNNE, proposing a vote of thanks to the authors of the two papers, said he was so in sympathy with the whole tone of their remarks that he found little to say in criticism. Sir Charles Nicholson had mentioned the difficulties he so often experienced with the clergy, and he (Mr. Prynne) thought all church architects had similar trials, and the clergy would be the first to acknowledge the fact. In the forties and fifties there was a great desire on the part of the clergy and students to enter into the study of architecture, especially Gothic work, but in the present day many of the younger members of the clergy were quite ignorant of the service of the arts. There were small matters of ritual with which they were conversant, but in studying them many of the younger members of the clergy had lost sight of the principles of church architecture. There was a tendency growing up among the clergy for a better knowledge of building, and that was an inclination which could be fostered by architects. But it was not only the clergy they had to deal with—there were church-building committees, bodies of people who generally had no knowledge of building and who seemed desirous of obstructing the architect in his work. Referring to the requirements of the day, Mr. Prynne said they had magnificent examples of old churches of what modern work should be. St. Michael's, Coventry, and others were models of the type of church they desired to see in towns. The cost of building was next referred to, and Mr. Prynne said they could not properly build a church under 12*l.* a sitting. It was in this matter of cost that the architect was so often hampered in

his design. Some people believed they were clever when they had driven the architect down to a small price; they overlooked the fact that the architect, to bring his work within the limitation imposed, had to eliminate the main features of his design.

Mr. H. H. STATHAM, who seconded the vote of thanks, suggested that the main point in the erection of a church was not to shelter a congregation, but to uplift their souls, and for that purpose they must be taken away from the common associations of building. Mr. Statham advocated a large organ in a church unless it was wished to have only choir singing. Congregational singing needed something that would give harmony and base to it.

Mr. MAURICE B. ADAMS and Mr. E. PRIOLEAU WARREN supported the vote of thanks.

GUSTAVO GIOVANNONI AND CURVES IN PLAN IN THE TEMPLE AT CORI.*

By WILLIAM A. GOODYEAR.

(Continued from page 95.)

THE mental corrections of optical appearances which are described by Professor Hauck have a curious analogy in the experience of Mr. John W. Beatty, M.A., director of fine arts in the Carnegie Institute at Pittsburgh, Pennsylvania. The following extract from his letter to me on this subject is published by his permission:—

"Briefly put, my experience was this. When I first put on glasses for astigmatism, perpendicular lines appeared not parallel, being wide at top; in the size of a newspaper page about $1\frac{1}{2}$ inch wider than normal. When I had worn the glasses for several months lines seemed again parallel. Now, when I take the glasses off, lines are again not parallel, but wider at the bottom. Dr. Lippincott's theory was that I had always made mental correction, and lines recorded on the retina out of parallel were made to appear parallel by virtue of mental correction. This seems to be absolutely proven by the history of the case, as above briefly outlined. When I take the glasses off now, I see lines imperfectly at the instant of time, because the brain is not given time to correct the defect. The fact that the greater width is now at the bottom without glasses, whereas it was at the top with glasses when they were first used, is significant. You will find the reference to my case in the 'Archives of Ophthalmology,' vol. xviii. (1889), p. 18, and more particularly p. 28."

All these facts assist us to understand why lines which are optically seen as curves are not generally recognised as curves by the everyday human being. They also enable us to understand that the perception of the curves which are optically present in the facts of vision varies according to temperament and according to training. As a matter of fact there is no perspective which is not curvilinear, but as these perspective curves are too delicate to be generally represented in the dimensions of pictures, instruction in perspective, as regards draughtsmen and painters, generally ignores them, and hence does not tend to counteract the average human indifference to their existence which is due to mental correction.

All these points bear on the popular error that there is a natural sagging effect in architectural horizontal lines above the level of the eye, and it is now our mission to point out that no optical expert who has made a special study of the Greek curves has ever suggested that such a general sagging effect exists.

Thus the first investigator who made publication on the subject supposed that the Parthenon curves were intended to accent and increase perspective effect, because they develop and accent a form of curve which already exists in the normal optical appearance. This investigator was Hoffer, whose observations, measurements and publications were made in 1838, and thus anticipated the earliest observations of Penrose by seven years and anticipated his publication by eleven years.

Hoffer's publications were made in the "Wiener Bauzeitung" for 1838, whereas Penrose did not visit Athens till 1845, and did not publish his "Principles of Athenian Architecture" until 1851. The discovery of the Parthenon curves by Pennethorne in 1837 is generally supposed to have preceded the observations of Hoffer, but the publication of Hoffer long preceded that of Pennethorne, which appeared in 1878.

* A paper read before the Archæological Institute of America at Washington, January 2.

It will be observed that I am not advocating at present the explanation of Hoffer; I am simply pointing out that he was the first expert who made a special publication on the Greek curves, and that, so far from suggesting that these curves were intended to correct an effect of sagging, he supposed that they were intended to enhance and exaggerate a curve of exactly contrary character, and that this curve was mentioned by him as the ordinary optical appearance due to perspective.

The popular impression that the rising curves were intended to correct an effect of sagging, popularly said to be inherent in horizontal lines generally, is probably simply a misapprehension of the theory of Penrose, who never, however, suggested any such appearance in horizontal lines as a general rule. Penrose rested his theory of correction on the optical tendency of a horizontal cornice to curve downward under a gable, because the angles of the gable tend to appear wider than they actually are; therefore the bottom line is depressed, and as the depression gradually decreases according to distance from the angles, therefore the depressed line appears as a downward curve. According to Penrose, the rising curve under the gable was to correct this effect. But so far as the flanks are concerned, Penrose supposed the curves to be explained by the sentiment of beauty and the appearance of strength, but to have been originally suggested by the application of the curve as an optical correction under the gable. Thus we are led next to ascertain the present standing of the gable theory of Penrose, which appears to be the original form of the debated popular impression, although it is really a wholly distinct proposition.

This leads us to consider what other authorities later than Penrose have had to say about his gable theory. This gable theory has never, to my knowledge, been accepted or even favourably mentioned by any German authority. On the contrary, it has been vigorously and successfully contested by both of the two greatest German authorities who have subsequently debated the curves from the standpoint of the experts in optics. First, Thiersch* added to a variety of solid arguments one which must appeal to every understanding, whether that of an expert or otherwise. The argument is mainly this:—If Penrose was correct in believing that the curves of the entablature and cornice, at the ends of the temple, were intended as an optical correction under the gable, and to make the lines appear straight, how does it then happen that the stylobate is curved also where no such gable effect occurs? This argument is unanswerable. The only objection to it is that it is so simple, so conclusive, and must be so briefly stated, that it falls short of effect from sheer simplicity. It is, however, gilding the lily to elaborate this argument. It is not necessary here to rehearse the alternative suggestion of Thiersch who thus and otherwise contested the gable theory of Penrose, because it has also been thrown out of court by two subsequent events. One of these events was the argument of Guido Hauck.†

Although Hauck abandoned the new explanation of Thiersch, he approved and rehearsed and elaborated the arguments which led Thiersch to reject the theory of Penrose, especially dwelling on the point that the stylobate need not have been curved if the object of the curve was to correct a deflection under the gable. Both Thiersch and Hauck also urge the sensible view that to consider the curves of the entablature on the flanks of a temple as purely an afterthought is a far-fetched and wholly unsupported hypothesis. Let it be also observed that the theories of Thiersch and Hauck which proposed to supplant the theory of Penrose make no reference to a general sagging effect in horizontal lines, and Hauck expressly develops the fact that horizontal lines above the level of the eve tend to curve downward toward the extremities instead of curving upward toward the extremities, as they would if they had a sagging effect. Thiersch alludes to the same fact.

The publication of Hauck is undoubtedly the most valuable and far-reaching contribution to the optics of rising curves in elevation which has ever been made. But as an explanation of the subject of curvilinear refinements, viewed as a whole, it has also been thrown out of court. Therefore I need not describe the theory of Hauck. It is sufficient to say that it is based, like the theory of Thiersch,

on the form of the Greek temple and on the idea that the curves were invented by the Greeks and that these curves were always rising curves in elevation.

(To be continued.)

ROYAL ACADEMY LECTURES.

THE first of a course of four lectures, to be given before the Academy students on successive Thursday and Monday afternoons, was delivered yesterday (Thursday) at Burlington House by Mr. Reginald T. Blomfield, A.R.A., the Professor of Architecture. The subject of this preliminary lecture was "The Study of Architecture."

In his introductory remarks the lecturer pointed out that architecture required a faculty of hard thinking peculiar to itself, and that, whereas the painter and sculptor had their means of expression ready to hand, the architect had to make his appeal by scarcely trusted æsthetic methods, and had to think out the full logical intentions of the methods he employed, for there was no such thing as impressionism in architecture. Therefore, to arrive at this difficult art, unceasing study was necessary. It was not enough to struggle through an apprenticeship content with picking up an approximate version of the fashionable manner of the time—the student must think for himself. He must make his aim the technique of his art. The idea then, with which the student must start is that he has to master architecture in the same spirit, and with the same tenacity of purpose, as that of the student of sculpture when he studies anatomy and modelling. Matters of purely sentimental interest were outside his purpose. The moral of the builders, the age of the building, were irrelevant to this search for technique. The student must concentrate his attention on the facts of the building. He should try to understand what a building was there to do, what the architect aimed at and how he reached his solution. In order to do this the point of view must be sympathetic. Criticism that assumed an intention which never existed in the designer's mind was worse than useless. For example, it would be wrong to criticise a Mediaeval architect for indifference to mass and outline when it was of his accepted tradition to show all his construction; and this known, was absurd to abuse Renaissance architecture for not calling emphatic attention to its construction when it never set out to do anything of the sort. Dogmatic first principles were, therefore, a delusion and a snare. There was on one first principle which an architect failed to observe his peril, and was that his building must stand firm and answer its purpose. When, therefore, writers invoked religious or moral sanctions for the architecture they preferred the student should be on his guard, the truth being that good and bad architecture is to be found in every manner that has been practised within the range of civilisation, and that the open mind and the sympathetic mind are the first conditions of the profitable theory of architecture. Further, in order that the student may discriminate between good and evil in his enthusiasms, some knowledge of what has been done in the past is necessary. Tradition in modern architecture has passed out of sight, and it is necessary that the student should acquaint himself with the history of the past in order to acquire his standard of practice. Skill in architecture cannot, however, be learnt from books; the proper study of the architect must be buildings themselves. The student should saturate his mind with what has actually been done, not with the idea of imitation, but in order to perfect himself in the process of architectural expression. He should beware of sketching indiscriminately. A student might sketch every bluff carving in St. Paul's, and yet leave the building perfectly ignorant of its architectural meaning. This was not the way to set to work. The student should make a systematic analysis of the plan and construction of the building he studied—possibly sketching might take a merely subordinate place in this process; but in so doing he would be following the practice of the great architects of the Renaissance. Mr. Blomfield proceeded to illustrate his remarks with reference to St. Stephen's, Walbrook, and St. Paul's Cathedral, and pointed out how the student should proceed in his study of those buildings. There were, of course, many other points of view from which architecture should be studied—e.g. its historical development, its relation to the personal temperament of the designer; but the lecturer laid special stress on the importance of accumulating knowledge from the systematic study of the best models. Such knowledge was of far greater importance than was generally realised, and it would bring its reward with the student in later years.

SCOTTISH ECCLESIOLOGICAL SOCIETY.

AT the meeting of the Glasgow branch of the Scottish Ecclesiological Society on the 19th inst., the Rev. Professor Cooper, D.D., in the chair, the Rev. T. N. Adamson, Broughty Ferry, read a paper on "Drontheim Cathedral and the Coronation of the King and Queen of Norway." Thereafter a paper by Dr. John Honeyman, R.S.A., was read on "The Old Arrangements in the Transept of Glasgow Cathedral," in which he referred more particularly to two blocks of masonry of unequal size in front of the rood-screen at either side of the entrance to the choir. These have a series of figures with scrolls on their fronts and the arms of Archbishop Blackadder on their ends, and Mr. Blore, who restored that part of the cathedral about 1841, seems to have come to the conclusion that they were the altars erected by the archbishop on the west side of the rood-screen. He accordingly finished them as altars. Since then these have always been spoken of and written about as such. Dr. Honeyman brought forward convincing evidence to show that they had never been altars, but only the decorated abutments of ribs spanning part of the wide stairs to the crypt, carrying a broad platform or gangway north and south to the galleries over the porches at each end of the transept. It was on this raised platform that the altars erected by Blackadder stood, which, like all others in the church, were destroyed after the Reformation. Dr. Honeyman pointed out that Mr. Blore's mistake was inexcusable, as he had a considerable part of this old structure before him as shown by Mr. Collie's drawings in 1833 and Billings's views later. Dr. Honeyman pointed out that the clumsy way in which this structure had been stuck on in front of the screen sufficiently proved that the latter was not erected by Blackadder, but was of older date (probably about 1430). He explained that one of the pedestals was larger than the other because the south aisle of the nave is fully a foot wider than the north aisle, and as the insides of the transept gables are flush with the aisle walls there is more space on the south side of the crossing than on the north side. Attention was also called to the fact that the beautiful little porches at each end of the transept, half-way down to the crypt, had been originally constructed with three bays open towards the centre. The effect of this symmetrical design has been greatly marred by the westmost bay on each side being built up and entirely covered by a clumsy flight of steps going up to the galleries, where they are quite unnecessary as these are also reached by flights of steps in the aisles. He advised that these should be removed and the porches restored as originally designed.

THE ROYAL OBSERVATORY, GREENWICH.

IN *The Architect* of last week the report of the highways committee of the London County Council relating to the chimneys of the generating station at Greenwich was published. The report of the committee appointed to inquire into the working of the London County Council generating station at Greenwich in its relation to the Royal Observatory was issued on Tuesday. Lord Rosse, representing the Royal Observatory, Sir Benjamin Baker, representing the London County Council, and Mr. J. A. Ewing, representing the Admiralty, the members of the committee, state they have clear evidence that the working of the engines in the generating station does give rise to vibrations of the ground which are felt at the Observatory. The vibrations are of a different character from tremors due to a passing train or to road traffic. The chimneys and chimney gases are next dealt with by the committee, who recommend that the two chimneys at present unfinished should not be built beyond a certain height, and that the gases discharged should in no circumstances be materially hotter than those now discharged from existing chimneys. The committee further offer the following recommendations:—"We are strongly of opinion that there should be no further extension on the present site. In our judgment the station should not have been placed there at all. The matter has gone so far that to remove the station now or to stop the completion of a second portion would involve a much greater expense than the circumstances warrant. There can, however, be no justification for any further enlargement. Whatever care be taken to avoid vibration, the discharge of large volumes of smoke or hot air into the atmosphere constitutes a danger to the work of the Observatory which must necessarily increase with any further augmentation of the power. Hot air, smoke and tremors of the ground are more or less unavoidable in a

town, and an observatory in one has, in the ordinary way, to take its chances. But a site near the Greenwich Observatory is the last place that should be chosen for the exceptional development of heat and power required in carrying out a scheme of distribution over the metropolitan area. Instead of further enlargement on this site a suitable site should be selected elsewhere for any extension that may be required, about which there should be no great difficulty, and the possible ultimate removal to it of the existing plant should be kept in view."

DECORATION OF THE PALACE OF WESTMINSTER.

THE following is the continuation from page 102 of the evidence of the President of the Royal Academy given before the Select Committee of the House of Lords:—

Earl of Carlisle.

As a practical question, would it not be thought that tapestries would secrete dirt very much?—Tapestries could be cleaned.

Chairman.

Is that not one of the recommendations of tapestry, that it could be cleaned?—Yes, that was what I was thinking. Tapestry can be taken down and cleaned.

Earl of Carlisle.

Does it injure the tapestry at all to clean it?—I should think not if it is properly done. I do not think that is an objection. If the tapestry is made with sound colours, I do not see that the cleaning should injure it; it might do so perhaps in the course of very many years.

There is another very important point upon which I should like to have your opinion and advice, namely, as to what are the methods of painting best calculated to secure the permanence of what is painted?—That is an important question. Fresco no doubt lends itself to the highest class of decoration; but fresco has been tried in the Houses of Parliament and it has been found to fail. But against that may be put this point: that there is one fresco—one of Mr. Armitage's, I think—in the hall upstairs which is absolutely sound. That fact shows that fresco can be safely used if it is done by someone who understands how to use it. If one fresco can be made permanent any fresco can be made permanent. At the same time fresco is discredited to such an extent that I doubt whether it could ever be recommended again; and it depends so very much upon the artist knowing exactly how to treat it. Mr. Armitage had studied in Paris, and I fancy I have heard that he was one of the students that assisted Delaroche in his painting at the Beaux-Arts; and he may have had some experience in painting frescoes which enabled him to use the method with more skill than other painters who had never tried it.

Earl of Plymouth.

Do you refer to the fresco in the upper lobby which remains?—Yes, the one which remains; that is, I believe, in a perfect condition. Of course, the enemy in London is sulphurous acid; there is no doubt that that attacks certain colours. There are two colours which have been very largely used in all such work, which were strongly recommended by the old painters, namely, terre-verte and yellow ochre. It is quite certain that yellow ochre is affected by the sulphurous acid in the atmosphere, and it disintegrates and falls away. If yellow ochre is used largely mixed with other colours, it would help to disintegrate the whole of the rest. Terre-verte is dangerous to use for other reasons. I believe that terre-verte combines with the intonaco of the fresco—the surface which is fresh laid on which the painter works more rapidly than other colours, and when used, as it often has been, as an underpainting, the colours that are laid over it do not bind with the intonaco and ultimately become detached and flake off. In the case of some of Mr. Watts's frescoes in particular, the result has been most disastrous because of his free use of terre-verte. The old painters used it, and the ancient writers on frescoes recommended it, and I have no doubt Mr. Watts acted on their advice and used it very largely to underpaint his frescoes, and the result has been that the whole surface has flaked off. His frescoes have suffered more than anybody's, I believe, in that way. I had an interesting experience myself, which I may perhaps mention. I was commissioned to paint a fresco in a church at Dulwich, and I went to see Mr. Watts and asked him about colours. I had been told that terre-verte was not a

safe colour to use; I think, in fact, before the committee that was appointed to inquire into the state of the paintings in the Houses of Parliament evidence was given (not by Professor Church, for it was before his time—I forget by whom it was given) that terre-verte was dangerous. I therefore asked Mr. Watts whether he had not used terre-verte and how he found it work. He said, "Yes, I have used it and it is perfectly sound and good to use, as I will show you; I have a panel here which I painted as an experiment; it is done with terre-verte." And he uncovered a panel which he brought out from behind a number of canvases; he had not seen it for many years, and he believed it to be in perfectly good condition, but when he uncovered it the whole painting had practically disappeared. I mention that by the way. But I believe that with a proper choice of colours and with a proper method of painting fresco would stand quite well, but the process appears to be so uncertain that I think it would be rather dangerous to make experiments. Then there is water-glass, which I think Mr. Maclise used for his large pictures, and Mr. Herbert also, I believe, used it for one of his pictures. Mr. Maclise's pictures suffered from an efflorescence which has never been entirely removed. The efflorescence has been taken off, but it has always appeared again. It depends very much upon the way in which the water-glass is used as to whether it is permanent or not. Then there is spirit painting, which Leighton used at South Kensington in his large paintings there. I have never used it, and do not know for certain, but I believe the method is pretty permanent. I think they have got very dirty. Whether they can be cleaned I do not know. Speaking for myself, I have only painted one wall decoration in fresco. All my other designs have been rendered in mosaic, so that I know nothing of these other mediums. Then tempera is as sound a medium as you can have if it is properly used; but that, again, is very difficult of use—it requires great practice and great skill. Then there is another mode which has often been used; painting in oil on canvas afterwards affixed to the wall. There is a method of painting in oil which will render the surface quite dead, which is, of course, one most important point. All wall-painting ought to have a dead surface. In the committee-room where Mr. Herbert's pictures are, the one that is painted in water-glass has a dead surface. The other is painted in oil on canvas fixed on the wall, and the paint not being properly "flatted," it shows shiny patches which spoil the whole effect of the picture. But this oil-painting on canvas has the advantage of being quite permanent; moreover, all painters know perfectly well what they are dealing with when they are painting in oil, whereas they do not know so well how to deal with tempera or water-glass or spirit-painting.

Earl of Carlisle.

Do you know about the pictures at the Royal Exchange?—I do not know how far they have got.

I believe a spirit medium—spike oil—was used there?—I believe that is the method. I do not know for certain what was used.

Do you know how the decorations by M. Puvis de Chavannes in Paris are done; I believe they are done in the same way, are they not?—I do not know.

Spike oil is used, is it not?—Yes, and I believe it is treated as a water-colour. I have never used it myself.

Earl of Plymouth.

Do you recommend either of these four methods which you have referred to specially? Do you think that in London, in our climate here, one should have a distinct preference?—I do not know enough about it to say, not having used all the materials. As I said, frescoes evidently can be made permanent because there is one fresco which remains uninjured. Mr. Herbert's picture in water-glass is also in a perfect condition; there is no injury apparent. I do not know whether it has been restored, but when I was looking at it yesterday it seemed to be in perfect condition.

Earl of Carlisle.

Apparently the Royal Exchange is the last experiment in England on a large scale; could you suggest who would be the best person to give us information as to the success of that method?—My impression is that Professor Church would be able to tell you more on this subject than anyone, because he has experience in all these methods and has had the task of restoring and refreshing the paintings here, and he knows, I think, thoroughly the character of the mediums employed; how far they can be made permanent,

how far they attract dirt, and how far they can be cleaned; those are important points.

Would you suggest that it would be desirable for us to have as well as Professor Church's opinion the opinion of a painter?—I think some of the painters who have worked in the Royal Exchange would know how far their own pictures are preserved. I have not been there recently, and I do not know what state the pictures are in; I think it would be desirable to have the evidence of some painters who have employed the spirit medium. It appears easy of practice, which I think is an important point, and does not involve the difficulty that is involved with tempera or fresco or apparently water-glass.

You use it on a dry wall, do you not?—Yes, it is used on a dry wall. If you ask me definitely what I should recommend, I think if I were asked to do anything of the kind I should try the spirit medium myself. I think there is a disadvantage (not as regards the permanency of the paintings or the decorations in the building) in having the picture painted in oil on the canvas and put on to the wall afterwards, that the decorative spirit may be lost in this way: that the man is working in his own studio and he has not got so distinctly in his mind what is desirable for the decoration of the building. I think it is fine practice, for young artists especially, to do their work on the walls, and, in fact, it would develop a high school of decorative art.

Lord Denman.

Do you know what medium the paintings in the Royal Gallery are done in?—I think they are in water-glass. I have always heard so. Unless they are done by a man who understands the method which he is using it appears to be subject to efflorescence, which makes dull, whitish blotches on the surface.

Chairman.

The efflorescence appeared on both the pictures, did it not?—Yes, but more on the "Waterloo" than on the other, because Mr. Maclise had gained some experience in painting the "Waterloo," and I think the other one was more successful.

Lord Denman.

For the Royal Gallery itself, would you recommend anything different from what has already been done?—If spirit medium were used I do not think you would be able to detect any difference from the water-glass medium. As regards any painting that dries in with a dead surface you would not know without examination what medium it is painted in.

Chairman.

Can you suggest to us anything which would in your opinion contribute to our finding the best method for securing the competent execution of any works designed? To give you an idea of what I mean, I may say, speaking my own personal opinion, not the opinion of the committee, it seems to me that the ordinary process of the formation of a committee for such a purpose is a very unsatisfactory method of securing the best result?—I see what your lordship means; I have not looked at the question exactly from that point of view; only as regards the employment of the artists.

I mean both points?—The best and most obvious method is to employ men who are artists of note, and who are known as eminent in the sort of painting required for the purpose, or whatever the particular art may be—mosaic if it be mosaic, or tapestry if it be tapestry. That is the first point, and is obvious, I think. But in working on a building like this, one of the principal objects should be the formation of a school for a high form of art, and for that you would have to find out and bring forward the younger painters and the only way to do that, so far as I can see, is by competition. As to whether it should be a general competition, like the original competition of cartoons, for prizes which would merely bring forward to the notice of the public those who are the best and most suitable artists, or whether it should be competition for the special works for which the subjects are determined, I am not sure. I should think probably the latter. When the subject was decided you might have competition, limited or unlimited, among artists to make designs for it and then choose which is the best. That is a very simple method of proceeding. In that way you would find out who were the younger men who were most competent to do the work. I think the great advantage of carrying on the decorative work of this building is the opportunity which it gives for the establishment of a higher school of painting that

is likely to arise from painting for exhibitions or for the market. The subjects suitable for such a work, whether historical or heroic or biblical, are such as to stimulate thought and effort. The modern tendency, which probably arises from always painting for exhibitions, is to consider that the study of nature is the end of art, instead of being merely the means for producing imaginative work.

Earl of Carlisle.

That almost answers the question I was going to put to you, which is, Are you of opinion that the present state of painting in England is prejudicially affected by the fact that there is very little public decorative work in this country?—That is precisely what I feel. The mere fact that the artist is painting for a great palace, the National Assembly, and that his pictures will occupy a permanent position in a building which will be open to the public, is in itself a great stimulus to imaginative effort, and is calculated to bring forth all his best energies. Then there is another thing: if there are a number of artists engaged in the work at the same time there is a sort of healthy rivalry which will induce each man to do his best, and that will certainly tend to produce a higher form of work than I think is prevalent at the present day, when painters depend upon independent patrons, or, worse still, upon dealers who cater simply for the market. The result of that is, not necessarily, but I think very probably, that painters paint down to the level of what is required from them rather than attempt to produce a more elevated form of work in composition and style. I think the carrying on of this work would be of the highest value to national art.

You therefore think that this question of completing the decoration of the building should not be looked at merely from the point of view of the decoration of the building, but also of the effect it may be supposed and hoped to produce on the school of painting educationally?—That is just what I feel very strongly.

Chairman.

Is there any other point to which you would like to invite our attention?—I think I have said pretty well all I have to say on the subject. It is impossible to go into details as to what should be done. I can only give a general idea of what I should propose to do if the thing were in my hands.

Earl of Plymouth.

May I ask you a question on one point? The nature of these buildings as a whole has not concerned itself with giving the best of light to wall spaces, has it?—No.

The only point I wanted to put was as to whether you had considered that particular point of the absence of light or of a particular kind of light in a good many parts of this building, with regard to the suggestion which you made to us?—Of course, where a place is very dark it seems rather a waste to put a painting there; in that case some simple form of architectural decoration would probably be best.

Chairman.

Could not something be done to improve the lighting in the building; for instance, in this room would not a lighter ceiling than this have the effect of making the room lighter?—It might in a low room, but I do not think it would have very much effect in a high room like this; but that is a question rather for an architect than for me—I give it merely as an opinion. Of course, the whole room would look lighter if it had a lighter ceiling, but I do not think it would throw much light on a painting on the wall. It would no doubt look lighter if the panels were light instead of dark wood, but I do not think it would make very much difference as regards a painting on the wall.

I was not suggesting covering the whole room with whitewash, but would not the white ceiling absorb less light, and therefore leave more light for a painting on the wall?—It might, but not to an appreciable extent, I think, so far as seeing the painting is concerned. It would make a lighter decorative effect, no doubt, but the ceiling does not receive very much light in a room like this, and I do not think it would make much difference as to lighting the paintings on the wall. No doubt the whole effect would be more agreeable.

An Appeal is being made throughout Buckinghamshire by the Archaeological Society for 3,000*l.* for the acquisition of the old grammar school buildings at Aylesbury for conversion into a county museum.

GLASTONBURY ABBEY.

THE committee of the Exeter Diocesan Architectural Society in their annual report state that they had passed a resolution with regard to Glastonbury Abbey, with the hope that immediate steps would be taken to purchase it for the Church, as it was advertised for sale. The committee, however, could not report progress in the matter, and it would be a standing disgrace to churchmen if the site of the cradle of Christianity in our islands should be secured by outsiders. The remains of this magnificent church, which must have been one of the largest in England, were of exceptional interest, as was also the ruin of the abbey kitchen. The committee asked the members to do all they could to stir up wealthy churchmen to do their duty and purchase the ruins.

NATIONAL PORTRAIT GALLERY.

THE following acquisitions have recently been made by the trustees of the National Portrait Gallery:—

The trustees have received by bequest from the late Rev. Arthur Bell Nicholls the portrait of his first wife, Charlotte Brontë, the famous novelist, drawn in 1850 by George Richmond, R.A.

With reference to the small portrait of Charlotte Brontë, painted in water-colours and signed "Paul Héger, 1850," recently purchased by the trustees, the authenticity of which has been called into question, the trustees have caused a searching investigation to be made into the history of the portrait, and have submitted it to severe expert examination. The trustees have satisfied themselves that the drawing is a genuine work of the date specified, and that the portrait is an authentic likeness of Charlotte Brontë. The question of the authorship of the drawing still remains under investigation.

The trustees have accepted as a gift from his Excellency the Earl of Selborne a portrait of his father, the late Earl of Selborne, Lord Chancellor, being a copy by Malcolm Stewart from the portrait by Miss Busk at Trinity College, Oxford.

The trustees have received and accepted as a gift from the committee of the Garrick Club a portrait of the late Sir Henry Irving, being a copy by H. Allen from the portrait by Sir J. E. Millais, P.R.A., in the possession of the Garrick Club.

The following portraits have also been accepted as gifts:—

Gathorne Gathorne-Hardy, first Earl of Cranbrook, G.C.S.I. (1814-1906), statesman, drawn by George Richmond, R.A., presented by his son John, second Earl of Cranbrook.

Sir Patrick Grant, G.C.B., G.C.M.G. (1804-95), Field-Marshal, a small oil-painting by E. J. Turner, presented by Colonel H. G. Grant, C.B., on behalf of the members of his family.

William Thomas Best (1826-97), organist and musical editor, a bronze cast from the medallion by C. Prætorius, presented by J. M. Levien, Esq.

A series of portrait-studies of artists and two caricature sketches of Lord Brougham (1778-1868), drawn by Charles H. Lear, presented by John Elliot, Esq., of Hoylake.

The following portraits have been acquired by purchase:—

Michael William Balfe (1808-70), musical composer, painted probably by Richard Rothwell, R.H.A.

Matthew Boulton, F.R.S. (1728-1809), the eminent engineer, medallion executed in 1807 by S. Brown.

John Constable, R.A. (1776-1837), the eminent landscape painter, drawn by Daniel Maclise, R.A.

Sir Thomas Foley, G.C.B. (1775-1833), admiral and flag-captain to Nelson at Copenhagen, drawn by H. Edridge, A.R.A.

Sir Charles Napier, K.C.B. (1786-1860), admiral and naval commander at Portugal and Syria, a small oil-painting by E. W. Gill.

The Glasgow Corporation have received a letter from the Royal Glasgow Institute of the Fine Arts asking for their assistance in connection with the jubilee of the Institute to be celebrated in 1911. It has been remitted to the sub-committee on art galleries and museums, &c., to confer with the Council of the Institute in regard to the extent of accommodation in the Kelvingrove Galleries that would be required by the Institute.

Temple of Athene at Sunium.

SIR,—I notice in your remarks on the "whiteness" of the columns of the Temple of Athene at Sunium that Dodwell, the English traveller, attributes it to the effects of salt sea air. You are probably aware that there are four drums from this Temple in the gardens at Chatsworth, Derbyshire, where they were placed by the sixth Duke of Devonshire eighty years ago. I examined them yesterday and found them quite white and not a particle of stain or lichen upon them even in the flutings, nor were they much weathered, whereas the plinth, composed of ordinary white marble, was green and so weathered that it is difficult to read the inscription, attributed to Lord Spencer, a copy of which I enclose. There is no doubt that marble such as this would be of great service anywhere and would I think retain its whiteness even in London.

Copy of lines attributed to Lord Spencer, engraved on plinth of column from Minerva's (Athene's) Temple at Sunium, in Chatsworth Gardens, Derbyshire.

These fragments stood on Sunium's airy steep,
They reared aloft Minerva's guardian shrine,
Beneath them rolled the blue Ægean deep,
And the Greek pilot hailed them as divine.

Such were then their look of calm repose,
As wafted round them came the sounds of fight,
When the glad shout of conquering Athens rose
O'er the long track of Persia's broken flight.

Tho' clasped by prostrate worshippers no more,
They yet shall breathe a thrilling lesson here;
Tho' distant from their own immortal shore,
The spot they grace is still to freedom dear.

—I am, sir, your obedient servant,

F. HOULTON WRENCH,
Assoc. M. Inst. C.E.

Sheffield: February 19, 1907.

The Chartered Surveyors' Golfing Society.

SIR,—At a meeting held at the Surveyors' Institution last night, the rules and regulations drawn up at the inaugural meeting were formally approved, and the following officers were elected for the year:—President of the Society, Mr. George Langridge (president of the Surveyors' Institution); captain, Mr. S. James Chesterton; secretary, Mr. Sydney A. Smith; committee, Mr. Ben C. Apps, Mr. A. Burnett Brown, Mr. Phillip Chasemore, Mr. R. Parry, Mr. Cuthbert Smith and Mr. S. F. Monier Williams.—I am, Sir, yours faithfully,

S. JAMES CHESTERTON.

February 15, 1907.

GENERAL.

Sir Aston Webb, R.A., has been appointed by the Vice-Chancellor of Cambridge University to the office of reader on Sir Robert Rede's Foundation for the present year. The lecture will be given in the Senate House on Saturday, June 8.

Sir James Guthrie, P.R.S.A., has left for a tour in the East. One of his travelling companions is Mr. E. A. Walton, R.S.A. He hopes to return to Edinburgh in May restored in health.

An International Exhibition of Arts and Crafts will be held in the Palais du Cinquantenaire, Brussels, from August to November 1907, under the patronage of King Leopold, the Comtesse de Flandre and Princesse Clémentine.

Representatives of the Kilwinning Town Council, Parish Council, and Irvine and District Water Board have agreed to instruct an architect to prepare sketch plans of the accommodation required by the different bodies in joint offices and a town hall, these plans to be submitted to a future joint meeting.

The Art Gallery Committee of the Manchester Corporation propose to hold an exhibition of the late Mr. Charles's collected works in the City Art Gallery during the coming months of March and April, and will be obliged if owners of such works, who are willing to lend the same for this exhibition, will communicate with Mr. William Stanfield, the curator. The exhibition will not be a profit-bearing one, and the committee are anxious to make it as complete and as widely known as possible.

Mr. A. Butler will read a paper at the Auctioneers' Institute, on March 6, upon "Antique English Silver." Mr. H. D. Buckland, the president, will be chairman.

The Establishment Committee of the London County Council anticipate that the conditions, plans, &c., for the County Hall will be all ready for issue to intending competitors by February 27. Taking that day as the date when the competition is publicly announced by advertisements, the designs for the first stage should be delivered six months later, that is, by noon on August 27.

The King recently appointed Mr. Harcourt, M.P. (First Commissioner of Works), the Earl of Plymouth and Sir Aston Webb, R.A., as a committee to advise His Majesty as to a site for the statue of William III. of Orange which is to be presented to His Majesty for the nation by the German Emperor. The King on Saturday inspected and approved the suggested site, which is on the south front of Kensington Palace, facing down the avenue to Kensington Gore.

The Finance Committee of Glasgow Corporation have remitted to the city engineer, Mr. A. B. M'Donald, to prepare a preliminary report on the designs sent in for the laying out of the Riddrie estate.

Sir Archibald Geikie has been elected president of the Geological Society of London, and Dr. J. E. Marr, Professor W. J. Sollas, Dr. Aubrey Strahan and Dr. J. J. H. Teall have been chosen vice-presidents. The secretaries are Professor E. J. Garwood and Professor W. W. Watts; the foreign secretary is Sir John Evans, and the treasurer, Mr. Horace W. Monckton.

A Tablet was unveiled on Monday in the porch of the church of St. Lawrence Jewry to the memory of Mr. George Low, F.R.I.B.A., a former churchwarden of St. Michael Bassishaw, and for many years the hon. secretary of the Bassishaw Friendly Association. A short memorial service in the church preceded the unveiling ceremony.

The Congress of Prehistoric Anthropology and Archaeology has accepted the invitation of the Irish Department of Agriculture and Technical Instruction to hold the next session of the International Congress at Dublin in 1909. In consultation with the Royal Irish Academy, the Department has arranged for a small local committee to take the necessary local action when the time arrives. An early preliminary notice is, however, desirable to enable papers to be prepared by intending contributors to the meetings. The importance of a meeting at Dublin to students of the early race problems of Ireland and of prehistoric archaeology will be generally recognised. Sessions of the Congress, which take place at intervals of a few years, have been held in many of the chief European centres, such as Paris, Stockholm, Copenhagen, Lisbon, Budapesth, Moscow, &c., and the many columns of the illustrated reports of the Congress form a recognised authority on prehistoric subjects.

Messrs. A. & J. Soutar, architects, London, have been awarded the first premium of 100*l.* in an open competition for the planning of a model village for the Brodsworth Main Colliery Company, Ltd., near Doncaster. The drawings required by the promoters included the laying out of 70 acres of land for 500 cottages, together with plans and elevations of various types of cottages, shops, village club, &c. Seventy sets in all were submitted.

The American Society of Landscape Architects held its annual meeting and dinner last month in New York. An attempt to give an impetus to the art of landscape gardening will be made soon by the publication of several foreign books dealing with the art as it existed in Europe a century ago. The first to be published are Humphrey Repton's "Art of Landscape Gardening," Thomas Whately's "Theory and Practice of Landscape Gardening," edited by Frederick Law Olmsted, jun., and the work of Fürst Pückler von Muskau, on his own park in Germany, edited and translated by Samuel Parsons, jun., landscape architect of the Department of Public Parks of New York. These are all old works and for many years out of print. They will probably appear in May.

Designs were recently submitted in limited competition for artisans' dwellings at Child's Hill, Middlesex, for the Hendon District Council. The design by Mr. George Hornblower, F.R.I.B.A., was placed first, and those by Messrs. Stanley, Barrett & Driver, and Mr. John Hudson, F.R.I.B.A., second and third respectively. The contemplated outlay, exclusive of road formation and sewers, is 32,600*l.*

Mr. F. Hamilton Jackson will commence a course of three Cantor lectures on "Romanesque Ornament" at the Society of Arts next Monday evening.

The Architect.

THE WEEK.

WE lately referred to the difference between the architects of Dundee and the committee of the Technical Institute about the competition for the new buildings. At first it was proposed to organise an open competition. But eventually it was agreed that the contest should be confined to local architects. An effort was made to fix the percentage at 4 per cent., but it had to be abandoned. Scottish authorities are more satisfied about their own confidence to deal with every subject connected with their administration than even English authorities. To ask for the appointment of a professional assessor to adjudicate upon the merits of the designs was therefore taken by the committee to be an equivalent to the abandonment of their privileges. And on that point there has been no yielding. The time spent in negotiations has had the effect of leaving only sixteen days for the preparation of plans. As the committee are equally stubborn on that point also, the Dundee architects have wisely resolved to take no part in the competition. Their decision will be approved by architects throughout Great Britain.

THE Select Committee on the Housing of the Working Classes Acts Amendment Bill made the unduly high rate of interest charged by the Treasury for loans the climax of the report. It was found that $4\frac{1}{4}$ per cent. was paid on loans which were to be repaid in twenty years, and the difference between that rate and 2 per cent., which was the statutory minimum, was equivalent to 3 $\frac{1}{2}$ per cent. a year in rent or 60 per cent. in capital. It was recommended that the 150 millions sterling deposited in the Post Office Savings Bank should be lent at the same interest allowed on it, or $2\frac{1}{2}$ per cent. A few days ago the Chancellor of the Exchequer was asked whether any steps had been taken to carry out the recommendations. The reply given was that the subject was receiving careful consideration and that a Bill could shortly be introduced to deal with the subject. It was stated that the Treasury does not make any profit out of the difference between the $2\frac{1}{2}$ per cent. paid on deposits and the $2\frac{3}{4}$ or higher rate which may be charged for loans. The surplus income each year is carried to a surplus income account of the Local Loans Fund, which, under the Public Works Loans Act, 1904, is liable to make good any deficiency on the capital account of the fund caused by the issue of stock at a discount.

It might be supposed that when designing a lunatic asylum, or, in fact, a hospital of any kind, the architect and his advisers, who generally form a committee, should be allowed to adopt the course considered to be most salutary for the patients. But in Scotland at least an improved plan is likely to entail increased taxation. The Lunacy Board of the city of Aberdeen lately erected an asylum at a cost of 119,200*l.* It contains 100 beds. The valuation for taxation was put down at 150*l.* There is a decision of the Scottish courts in what is known as the WOODILEE case that 4*l.* per bed was a reasonable valuation, and at that rate the valuation of the new asylum should be 1,916*l.* instead of 150*l.* It was necessary to bring the case into a higher court. One of the judges said he considered that 4*l.* per bed would have been reasonable, as there was no profit derived from the patients if the asylum had been erected on the ordinary plan; but the villa system was more expensive to realise, and his Lordship therefore decided that the valuation should amount to 2,400*l.*, or 24*l.* per bed. This opinion was adopted by the second judge. It may therefore be taken for granted that improved planning is hazardous, as it will increase the taxation 25 per cent. beyond the amount payable on a prison-like structure.

A NEW series of by-laws relating to offensive trades is about to be issued by the London County Council. Any person who desires to obtain licenses will have to send in with the application a plan of the premises and plans and sections of the buildings in which it is proposed to carry on such business, such plans and sections being drawn to a scale of a quarter of an inch to one foot, and showing the provision made, or proposed to be made, for the drainage, lighting, ventilation and water supply of such premises, and shall also furnish particulars of the number, position and size of the apparatus proposed to be used, and the method of disposing of any offensive or noxious effluvia, vapour or gas emitted in the conduct of the business, and shall also furnish a key plan of the locality showing the buildings and streets within 100 yards of the premises, drawn to the scale of five feet to one mile. The walls of the chamber or chambers in which operations are to be carried on will have to be covered on the interior with hard, smooth and impervious material, and the floors to be covered with concrete, asphalt, or other jointless impervious material laid upon cement concrete. The penalty for offending against the by-laws is 5*s.*, and if the offence is continued a further penalty of 40*s.* a day. There can be little doubt that the by-laws will have the effect of diminishing, if not overcoming, a nuisance that is disagreeable and dangerous.

THE flat arch which the younger BRUNEL erected in order to suggest the tenacity of brickwork was, it appears, anticipated in India. According to a correspondent of *Indian Engineering*, Colonel DE HAVILLAND, of the Madras Engineers, while in Seringapatam about 1808, proposed to erect a bridge across the Cauvery river, consisting of five spans of 110 feet, with a rise of only 11 feet. The project was received with derision, and in order to convince sceptics about its practicability he built in his garden at Seringapatam an experimental brick arch, having a span of 112 feet, rise of 11 feet, the breadth being 4 feet, thickness at the crown 3 feet 10 inches and at the springing 5 feet. Common country bricks and mortar were used in its construction, and this arch remains still standing. The arch or curved brick beam was not of uniform thickness, for it was thickened towards the haunches. A large block of masonry was erected at each end to resist the thrust. Colonel DE HAVILLAND died in 1866 at the age of ninety, and his brick arch is enough to prove that in construction he was in advance of the civil as well as the military engineers of his time.

WHEN the stately mansions were first built that seemed to enclose the Arc de l'Etoile in Paris, the majority of those who enjoyed the view from the Champs Elysées towards the Bois de Boulogne were annoyed. It seemed as if one of the best landscapes had been blotted out. But after a time people got used to the change, and it had to be owned that the new buildings were far superior to those which used to be found thereabouts and a few survivors of which were to be discovered quite recently. For various reasons that quarter of the city finds favour with English residents, and of late years English visitors have shown a preference for it. As a consequence some big hotels have been erected, and it is supposed that others which will be far higher are about to be placed there. The only sites available are behind the mansions built about a quarter of a century ago. What little remained of the landscape is now being blotted out; and, what is no less annoying to a Parisian, the noble Arc de l'Etoile is losing scale through its environment and is not as impressive as formerly. People in England suppose that the municipal authorities of Paris have despotic power and will not allow anything to appear likely to disturb the amenity of the city. But in Paris as elsewhere speculation is becoming dominant, and beauty has to succumb to the least possibility of profit.

THE GREENWICH VIBRATIONS.

AT one time it was not uncommon for the strong man in a travelling circus to amaze rustic spectators by lying on his back and allowing a heavy anvil to be placed upon his chest. A couple of men would then be invited, smiths having the preference, to try their strength by striking the anvil with sledge-hammers. Under the novel conditions they were quickly tired out, then, the anvil being removed, the performer arose and retired uninjured amid applause. The anvil was supposed to increase the danger of the man who supported it, while in reality it acted as a very thick piece of armour or cuirass, which served to protect him from a fatal accident. When in the early days of railways a Royal Commission was appointed to inquire into the risks which might arise from the employment of cast-iron bridges, the elaborate experiments were a confirmation on a large scale of the humble circus feat. It was ascertained that the power of resisting impact increased with the permanent load upon a bridge or beam, and the greater the weight at rest upon the beam the greater must be the momentum of a striking or falling body in order to break that beam.

An illustration of the principle was to be seen in the introduction of machinery into buildings without any special preparation having been made to resist the vibration which might easily be imagined to be an accompaniment of all kinds of motive-power when in action. No doubt men instinctively preferred to place machinery in the basement of buildings in order that if a collapse happened the fall would be diminished. But in London, and in most of the large towns of England, machinery will be found on other floors. The noise may become a nuisance to the occupiers of adjoining premises, and nervous people, when they hear the regular thuds, readily conclude there is a likelihood of a structural accident in which they might be involved. But the cases are rare in which walls or floors collapse. If a floor can sustain the dead-weight of a machine its action will not much increase the strains on the support unless under very peculiar circumstances. There is, of course, the possibility of a machine getting out of order, and its action in that case might have a destructive effect on the floor. But in designing floors it is considered safe in the majority of cases if double the dead-load is assumed as a weight which has to be provided for in arranging the proportions of the girders and other members.

When it was announced that the engines in the generating station of the London County Council had caused vibration in the Greenwich Observatory, which is about half a mile distant, there was some amazement among men having experience in building, whether as architects, engineers or contractors. For if under conditions where more than the average amount of care would be exercised there was vibration, what was to be expected in ordinary cases? If in the Greenwich Observatory, where delicate tests were undertaken, danger was ascertained, the conclusion was unavoidable that in ordinary buildings where engines were at work there could not fail to be danger, although no means had been employed to determine its extent. In other words, there was a misgiving that the general confidence in manufacturing premises especially was misplaced. The report of the scientific committee, consisting of Lord ROSSE, representing the Royal Observatory; Sir BENJAMIN BAKER, representing the London County Council; and Dr. J. A. EWING, representing the Admiralty, was therefore waited with anxiety.

The London County Council, whom so many people held to be culpable in the case before the circumstances were known, as if skilful construction was impossible under any public department, expressed from the first a desire to avoid everything which would injuriously affect the Observatory. Whether it was wise to select Greenwich as the site of a generating station need not be considered. If the least risk was apprehended, however, the Government authorities could easily have

prevented the erection of the station. But in the inquiry the County Council have accepted the blame if any, and Sir BENJAMIN BAKER, their representative has obtained the evidence which must be considered as the most precise and therefore the most damaging to the Council. We refer to the report by Professor DALBY. Rigorous as may have been the investigation it must be admitted that the vibration does not arise from any defect in the construction of the station, and nothing was elicited to give occasion for alarm among manufacturers who employ either hydraulic, steam or electric engines. Important as would be the results of the Royal Observatory and to those who have to utilize the observations made by the officials, still greater harm would follow if it were concluded that a building could not be erected which would be free from vibration if it had to shelter a powerful engine.

During several years tremors have been felt in the Observatory, which were due to railway and road traffic. Since the engines in the generating station began to work, vibrations differing in character from the tremors have had to be sustained. Instead of being intermittent, they are never wholly absent. But the committee were unable to discover evidence that the vibrations affected materially the observation of the stars, which is the principal occupation of the official. According to the report, "there is already *prima-facie* evidence that the most delicate observations which have hitherto been made can still be made, although the engines are running; but without further data we are not in a position to speak positively on the point." Oscillations were shown by the aid of mercury, and this no doubt suggests a disturbance of the former conditions of the Observatory, and they may give rise to doubts in a comparison of the calculations of the astronomers with those of other observatories. But the vibrations are of a kind which anywhere else would not be worth notice. It has been found that in some of the American tall buildings wind-power or other atmospheric influences may cause a vibration that has reached occasionally half an inch. But it is very doubtful whether the vibrations in any part of the Observatory could be expressed by figures which ordinary men were able to appreciate.

Infinitesimal as it may be, what is the cause of the vibration? Professor DALBY has ascertained beyond all doubt that the defect arises from the character of the engines. If the anvil employed by the Samsobol the rural circus happened to be improperly welded, and a flaw existed from the upper surface to the base, a blow struck upon it might be fatal to him, although he would not feel any blow struck upon an adjoining part. If also the blows were aimed at the sides of the anvil and caused a slight motion of its heavy weight, human patience could not endure the inconvenience. The designers of the engines, accepting the old belief that an engine when once firmly fixed in position can be set in motion without producing any injurious effect on the foundation, have created dynamic forces which are in opposition and which tend to overcome the inertness of the concrete bed. As Professor DALBY says:—"The balance-weight on each engine formed by the prolongation of the crank-arm in the contrary direction to the crank is only sufficient to balance the revolving masses of the engine;" and "the unbalanced forces acting on one foundation block due to the pair of engines balanced to it, the two engines driving one generator, the force on the block is that due to an unbalanced horizontal force of 3 tons at 94 revolutions per minute, and an unbalanced horizontal couple of 1,200 foot tons approximately. There is also an unbalanced vertical force on the block of 2 tons approximately, and an unbalanced vertical couple of 690 foot tons." With the aid of mercury Professor DALBY says there is no cause motion of the block of concrete, although to what extent he has not discovered.

The remedy is to be found by the introduction of a revolving balance-weight, and by making the vertical

on equal to the horizontal piston. The estimated would be 2,700*l.* for each engine. But as there is evidence that the star observations are injuriously affected, the committee say they do not feel warranted to spend so much money. It is suggested that in the contemplated extension of the station care should be taken to have accurately balanced steam-turbines and compressors. It is also recommended that reciprocating engines should not be used after 10 P.M., and if possible, 11 P.M. should be adopted. It will therefore be evident that in spite of all that has been alleged in the newspapers the Observatory of Greenwich has not been injured, and is not likely to suffer, from the vicinity of the generating station.

A more real grievance relates to the two chimneys adjoining the generating station. The air is obscured in the field for the observation of the stars is retarded. But the Astronomer-Royal admits that the existing chimneys have not hitherto seriously affected his observations. The committee consider they could be shortened 33 feet without any injury to the stoking at a cost of about 1,900*l.* It is remarkable that the committee do not recommend the removal of the upper part, for it might be found that the expense was unnecessary. They suggest that a year or two should be allowed to elapse before a decision is made to. Two chimneys were in progress when the investigation was proposed, and operations on them were once suspended. The committee recommend that they should not be carried up any higher, especially as one of them is intersected by the "altazimuth line" of the observatory, or 182 feet above the stoking floor. The lower portion of the generating station can be then cleared out and equipped to the extent of 20,000 kilowatts, but the committee are strongly of opinion that there should be no further extension on the present site. It will be evident that no sacrifice of any importance is essential. All that was expected by the professional architects is reduced to insignificant proportions. An engine was not properly designed to meet all the contingencies, and in consequence a little mercury in a U-shaped trough half a mile away was disturbed. That was the head and front of the offending. But the investigation has had its use in demonstrating that vibration is rare in buildings, and that even with engines which imperfectly balanced the extent of it is too slight to be measured by any philosophical instrument.

THE WORKMEN'S COMPENSATION ACT, 1906.

By Professor W. S. HOLDSWORTH, D.C.L., &c.

ON July 1 of this year this Act will come into force, and will repeal the two earlier Workmen's Compensation Acts of 1897 and 1900. We propose, in the first place, to discuss two of the many difficulties in the construction of the Act which are apparent on its face, and, in the second place, to say a few words upon some of the principles underlying some of its sections.

(i) The first difficulty arises upon the first section of the Act. Section 1, subsection 1, provides that "If any employment personal injury by accident arising out of and in the course of the employment is caused to a workman, his employer shall be liable to pay compensation." Subsection 2 of this section contains several provisos to the section. Proviso (c) runs as follows:—"If it is proved that the injury to a workman is attributable to the serious and wilful misconduct of the workman, any compensation claimed in respect of the injury shall, *unless the injury results in death or serious and permanent disablement*, be disallowed." We shall deal later with the question of the principle which underlies this proviso; at present we are concerned only with its construction. We observe, in the first place, that the injury must have been caused by accident; and we may take as authoritative the defini-

tion of the term "accident" given by the House of Lords in *FENTON v. THORLEY & Co.* (1903) A.C. 443. The term accident means "an unlooked-for mishap or an untoward event which is not expected or designed." The injury may have been caused by some deliberate act on the part of the workman. In that case he had ruptured himself by putting out all his strength to start a machine; but this will not make the injury any the less accidental. It is undesigned or unexpected, and therefore an accident if we use the expression "accident" in the ordinary and popular sense of the term. Now, if we take this definition of the term "accident," we ask ourselves how it is to be applied to the proviso cited above. How can it be said that an injury which is due to the serious and wilful misconduct of the workman is "an unlooked-for mishap or an untoward event which is not expected or designed?" Lord LINDLEY, in the case which we have cited above, seems to be of opinion that an injury due to the serious and wilful misconduct of the workman could not be regarded as accidental. "It appears to me," he says, "that *prima facie* the Act entitles the workman to compensation, but that this inference may be displaced by proof that the injury is attributable to his own serious and wilful misconduct, or to some other cause which shows that the injury was not accidental." Yet the proviso contemplates the payment of compensation to a workman, or the family of a workman, whose injury is attributable to his own serious and wilful misconduct, if that injury has resulted in his death or serious and permanent disablement. How such an injury can be accidental, so as to bring the case within the first subsection, we must leave to the judges to discover. Looking at the manner in which they have interpreted the term "serious and wilful misconduct" (*The Architect*, Nov. 23, 1906, p. 335), it would be clearly difficult to say that any injury resulting from such misconduct was accidental at all; and it is only if the injury is accidental that the right to compensation arises. If it be said that this workman did not, though guilty of serious and wilful misconduct, expect or design this mishap, the answer is that the law presumes that persons intend the natural consequences of their acts, and that upon such presumption the mishap was neither unexpected nor undesigned. The presumption is a necessary one. As the Court of Common Pleas put it in 1837:—"Instead of saying that the liability for negligence should be co-extensive with the judgment of each individual—which would be as variable as the length of the foot of each individual—we ought rather to adhere to the rule which requires in all cases a regard to caution such as a man of ordinary prudence would observe." But unless the Courts are prepared to relax this rule, it is difficult to see how effect can be given to the two parts of the first section cited above. It appears to us that an injury can only be said to be at once accidental and the result of the serious and wilful misconduct of the workman if we interpret the word "accidental" as meaning, not that which was unexpected or undesigned by a man of ordinary prudence, but that which was unexpected or undesigned by the workman who has seriously misconducted himself.

The second difficulty arises upon the thirteenth section, which defines the term "workman." It runs as follows:—

Workman does not include any person employed otherwise than by way of manual labour whose remuneration exceeds two hundred and fifty pounds a year, or a person whose employment is of a casual nature, and who is employed otherwise than for the purposes of the employer's trade or business, or a member of a police force, or an outworker, or a member of the employer's family dwelling in his house; but, save as aforesaid, means any person who has entered into or works under a contract of service or apprenticeship with an employer, whether by way of manual labour, clerical work, or otherwise, and whether the contract is expressed or implied, is oral or in writing.

There are many difficult questions which arise upon this definition. The term "casual nature," for instance, will require some explanation. But it would appear that, apart from the exceptions, everyone who is engaged in manual labour, whatever the amount of his or her remuneration, is entitled to compensation; and that everyone who is engaged in labour other than manual labour is entitled to compensation if his or her remuneration does not exceed 250*l.* a year. What we should like to know is this:—Suppose a person is employed by three employers, each of whom pay him under 250*l.* a year, but his whole earnings amount to more than that sum—can he claim compensation from the employer about whose business he was engaged if he meets with an accident in the course of that employment? There seems nothing in the Act which would prevent him making such a claim. But it is quite clear that if such a claim is allowed the Act will compensate a person who is well able to take care of himself.

(ii) It is not without interest to inquire what (if any) are the principles which underlie this Act. The first observation which will strike the critic is the curious evolution of the legislation upon this subject. The Act of 1897 proceeded upon the principle of compensating persons for accidental injury (1) if the character of their employment rendered them peculiarly liable to injuries resulting from it, and (2) if their earnings were not sufficient to enable them to secure themselves from such risks. As the number of persons coming within the Act was extended the first principle was gradually lost sight of; and now in the present Act all persons (with very few exceptions) are given the right to compensation. This Act also goes a long way to undermine the second principle. A man may be employed upon such terms that he is well able to afford to insure himself against accidents; but the Act compels the employer to compensate him. Though we agree that in the case of those who cannot afford to insure themselves the provisions of the Act are not unjust, we cannot think that it is politic to cast the entire burden of insurance on the employer in cases where a person's earnings enable him to pay the whole or some part of his insurance. Such a provision seems to be a direct discouragement to the virtues of thrift and self-reliance and a direct incentive to rely upon State legislation for that provision which it is a man's duty to make for himself if he can afford to do so—a long step, in short, towards the substitution of a socialistic for an individualistic basis in the ordering of society. It is not without interest also to observe that the breadth of the provisions of the Act will tend to encourage the large employer of labour at the expense of the smaller man. If I employ a small man to come and keep my garden in order two days in the week I must insure him. If I contract with a large gardener to supply me with a man I am under no such liability. Though we do not suppose that the Act was deliberately intended to inflict such injustice, we can quite well see that the result may be by no means distasteful to the more rampant of the Socialists. The more industry is concentrated in the hands of a few big men or big companies the more speciously will it be possible to raise the cry of monopoly in answer to those who, in the interests of economy and efficiency, are the opponents of municipal or any other form of Socialism. It is easier to appropriate a few large business undertakings than to suppress the smaller and more numerous undertakings of many persons. We have all of us heard the tale of the ruler who wished that certain of his recalcitrant subjects had but one neck, that he might be able to strike off all their heads at one blow.

But this Act does more than merely extend the provisions of the older Acts. Some of its provisions make it quite clear that the very persons who cry out against class privileges are themselves engaged in the creation of a privileged class. We have seen that if any meaning is to be given to the proviso in subsection 2 of the first section, we must exempt the

working man from the necessity of conforming to the average standards of prudence. Section 13 goes yet further. In the definition of "dependants" we read that "when the workman, being the parent or grandparent of an illegitimate child, leaves such child so dependent upon his earnings, or, being an illegitimate child, leaves a parent or grandparent so dependent upon his earnings [the word 'dependants'] shall include such an illegitimate child and parent or grandparent respectively." It appears therefore that the working man is exempt not only from the obligation to observe the ordinary rules of prudence, but also the ordinary rules of morality. The burden of the employer is to be increased by the immoralities of his workmen, even as in olden days the country was burdened by the necessity to make provision for the illegitimate sons of kings. That the lot of the illegitimate child is hard no one can deny, but that it should remain hard in the interests of morality is obvious to most sensible persons, and has up to now been obvious to the Legislature. That the illegitimate parent has any title whatever to consideration is an opinion which we should have thought no sane person would have even considered. But it is otherwise if the illegitimate parent is a working man—says the present Government of this country.

The sacred working man is privileged in many ways—in his housing, his means of locomotion, in the free education of his children, in his free insurance against the risks of his calling, in the immunity from legal process which his trade union enjoys. Since all these privileges are not sufficient this Act privileges also his serious misconduct and his immoralities. The king can do no wrong, nor can the trade union. The workman may indeed do wrong, but the consequences of his wrong-doing must, where possible, be lightened. His weakness is such that he demands and obtains a unique protection against his own folly and wrong-doing, and yet politically he is placed on an equality with those who need no such immunities for their protection. The Legislature, by conceding his demands, has created a situation to which the pen of SWIFT, and SWIFT alone could have done adequate justice.

NEW BOOKS.

IT may not be generally known that in 1886 a society for the study of monumental brasses was founded in Cambridge. About 1897 an Oxford University Brass Rubbing Society was also attempted. In different counties efforts have been made to illustrate and explain local relics. Mr. H. W. MACKLIN, M.A., president of the Monumental Brass Society, has prepared a volume on "The Brasses of England" for a series known as "The Antiquary's Books," published by Messrs. METHUEN & Co. Eighty-five illustrations are given of characteristic examples. The author says:—"It will be found that the history of brass-engraving falls naturally into definite periods, each with its special characteristics. In the widest sense the periods will correspond with those of contemporary architecture, and this will help to explain why brasses begin at their very best, and then, after a single century of great excellence, gradually decay with architecture, until they are lost in the Classic revival. In a more restricted sense they roughly correspond with dynastic changes in English history, and will be so treated in the present volume." These generalisations agree with the author's as expressed in a handbook which he published in 1890. A great many brasses have survived in England—probably about a thousand. For a long time they were accepted as a favourite kind of memorial, and men left funds to have them engraved. Although money could not have been so abundant in Aberdeen, there is a record of one erected in 1613 at a cost of 12*l.* 15*s.* 6*d.*, which would more

ent a much larger sum in our time. Whether brasses would be as much appreciated as they are if reproductions were more difficult is a question not easily answered. Rubbings can be so easily obtained, large numbers of tourists consider it is necessary to possess specimens. How far they have any value as portraits is impossible to determine. At one time they were considered to be mere conventional representations. But as a closer study has demonstrated that the worth of realism was recognised in ancient Egypt, we may also suppose that occasionally an effort was made to impart resemblance to the brasses. In the representation of costume and armour it was possible to have fidelity without much trouble. Caution should, however, be exercised before accepting the details, for on a brass in Norwich a man is shown in armour which could not have been in use for at least a century before. Many men up to the time of the Reformation belonged to confraternities or guilds, and they had the privilege to be buried in robes resembling those of professed monks. The brasses which represent laymen as if they were friars are therefore not to be condemned for inaccuracy. Mr. MACKLIN adopts the chronological order in describing brasses, and there are references to the most interesting examples in the country. He is compelled to condemn the destruction of many of them as victims of restoration:—"The architects and clergy of the last two generations have unfortunately wrought much havoc amongst the art and antiquities of the times whose memory they wished to preserve, and it is the more surprising when we remember that the engraving and setting of monumental brasses was just one of those arts which were most closely connected with the rise and fall of ancient Gothic architecture in England." After the perusal of Mr. MACKLIN's book we doubt if the youngest architect would be indifferent to the interest of a brass or in any way propose its removal or destruction. It is a valuable treatise and must represent a long course of inquiry and comparison.

The pocket-book of "Approximate Estimates," by E. COLEMAN (published by Messrs. SPON), is expanding at such a rate that we may soon expect to see it double the size of the original edition. It is admirably adapted for the use contemplated by the author. It not only gives estimates, but occasionally reveals the actual cost of executed works. The Foreign Office in London, for instance, cost 1s. 1d. per foot cube, while the Houses of Parliament ran up to 2s. 6d. The author points out the remarkable variation which exists between tenders, specially if compared with estimates. An estimate for refuse destructor required by the Metropolitan Asylums Board was calculated at 210*l.* The highest tender amounted to 1,250*l.*; the lowest was 58*l.* For painting a public building the tenders ranged from 75*l.* to 2,341*l.* The enhanced cost of labour and materials is remarkable. In 1892 cottages were erected at 200*l.* each; twelve years afterwards the price rose to 320*l.* each. Mr. COLEMAN considers that within the last ten years the increased cost of building varies from 5 to 30 per cent. Unless generous allowance is made there is risk in employing old price books.

If we may judge of the programmes of technical schools and the numbers of young people who pay fees to be allowed to take part in the process, the taking out of quantities would appear to be almost a diversion. If they are never called upon to work from genuine architect's drawings, they are, at least, likely to have acquired more or less training in analysis which will be well worth the time and money expended. "The Quantity Student's Assistant," by Mr. GEORGE STEPHENSON, published by B. T. BATSFORD, is so well adapted for novices, it would be an advantage if the substance of the greater part, if not the whole of it, could be committed to memory. It has, no doubt, the disadvantage of being without diagrams, and therefore confusion about the meaning of words is sure to arise. Otherwise it is well adapted to serve as a primer of the process, the instructions in which can be modified

according to circumstances by students who take up quantities as a business.

Wood-carving is considered by officials and other authorities as one of the arts or crafts which are indispensable if England is to remain a competitor with foreigners. The book on "Practical Wood-Carving," by Miss ELEANOR ROWE, is as instructive a book as any student could desire. The authoress was twenty years manager at the School of Art Wood-Carving at South Kensington, and is therefore competent to explain the most effective ways of obtaining results. But it would be a satisfactory addition if something were said about the monetary advantages which an average student is likely to derive from the art. A great deal of the ornament which at one time was carved by hand can now be produced by machinery at a fraction of the cost. The egg-and-tongue moulding, the acanthus-leaf moulding and other varieties which appear in the pages seem to be almost too mechanical for human hands. Men and women in this country cannot compete in price with foreigners who make the work a family affair, although they may show at least equal artistic skill. With all such arts, plain-speaking is desirable, for it is absurd to allow young people to imagine that work which may be well adapted for relaxation or spare hours in the evening is, owing to the price paid for it, sufficient to gain for them an ordinary "living wage." Assuming that the student is aware of all the risks, the pages are well suited for his or her instruction. There are illustrations from actual examples in various styles; there are photographs which show how tools are to be held in working and there are diagrams to explain the construction of pieces. The instructions are clear and detailed, and if not sufficient to enable the student to dispense with the kind of teaching usually given in technical schools, will at least serve as an efficient auxiliary to it.

TEMPLE OF NAKHON WAT.

THE Naga temples, which exist in an extraordinarily perfect condition, are as large and as magnificent as any religious buildings in the world. That called Nakhon Wat, in Cambodia, is the most remarkable of them all. Its dimensions are amazing. Its plan is almost an exact square, and measures nearly an English mile each way. The walled enclosure of the temple is in area 1,080 yards by 1,100, and is surrounded externally by a moat 230 yards wide. The temple itself consists of three enclosures, one within the other, each raised to such an elevation above the outer as to give the whole a pyramidal effect. The several enclosures are, in fact, double open galleries or verandahs, supported on ranges of columns, the whole being carved with bas-reliefs. It is scarcely possible to speak too highly of the architectural beauty and repose of these arcades, or rather colonnades. Certainly no Gothic cloister ever exceeded them. Mr. Fergusson grows eloquent as to the marvellous excellence of the masonry and as to the constructional perfection of the arrangement for excluding the sun and admitting both light and air by the use of double verandahs, the outer one lower than the other. The bas-reliefs, however, are even more wonderful than the architecture which they adorn. They occupy an aggregate length of at least 2,000 feet, with a height of about 6½ feet. The number of men and animals sculptured in these reliefs cannot be much less than 20,000. There is a noble causeway across the lake leading to the chief entrance; an antenaos, supported by 100 columns, and measuring 180 by 150 feet; the naos itself, measuring 213 feet by 200, with a sort of spire at each angle, and a loftier one—of the usual composite pyramidal Oriental form—in the middle. All the courts were tanks, capable at least of being occasionally flooded. It is a most curious circumstance that the columns of this temple resemble closely the Roman Doric, just as the Grecian Doric must have lent its peculiar forms to Cashmere. No explanation can be given of this strange peculiarity.

The Norwich Town Council have appointed Mr. C. J. Brown, the architect of the education committee, as architect of the proposed new public elementary school in the Heigham district.

ROYAL ACADEMY LECTURES.

IN his second lecture to the Academy students, delivered at Burlington House on Monday afternoon, Mr. Reginald T. Blomfield, A.R.A., F.R.I.B.A., the Professor of Architecture, dealt with the question of "Design and Temperament."

Mr. Blomfield reminded students that when they had adopted the advice he offered in his first lecture, that they should analyse the buildings to be studied, breaking them up into their abstract parts, and searching for the principles of their design and construction, the critical study of buildings would by no means have been completed. So far they would only have gathered what would be of immediate use to them personally as working artists. Not only was there an infinite field of history, but there was the other side of the case—the right appreciation of the artist himself whose work they were studying. It was ungrateful not to discharge that debt; but, apart from that, it was only by this wider study of architecture under all its varied aspects that the student could understand how great and vital an art it was, and the extent of its resources as a means of expressing thought and emotion. It was a mistake to dwell exclusively on the technical side of architecture—that must, of course, be mastered before one could hope to design; but architecture was something greater and more profound than merely technical excellence. Though its appeal was more abstract and less readily understood than the other arts, it was like them, in the last resort, addressed to the emotions. Temperament, no less than imagination and intelligence, was an essential element in all good architecture; and by temperament he meant some force and passion within a man which drove him out to do certain things in a certain way and no other—thus they could not imagine Vanbrugh translated into terms of Robert Adam. He proposed, therefore, that evening to leave the beaten track of technical discourse, and to make an excursion into the dimmer regions of artistic temperament, with the double object of arriving at a clearer understanding of the work of the artists he should refer to, and also of showing that the art of architecture was not a mere cold abstraction, but that lofty aims and a strong personality would leave their mark on architecture not less than on the other arts. He held that if the life and work of typical architects were studied, it would be found that in their work design and temperament were intimately associated, that through all vital art there ran more or less strongly the man's peculiar personality. In many cases one's want of personal knowledge of the artist prevented full understanding of his work; we could only read back from the work to the man—and here we were met by certain historical limitations. The sympathetic study—the psychological study—of individual work was scarcely possible before the days of the Renaissance. As an example of the interpretation of an artist's work by his personal temperament, Mr. Blomfield selected Alberti. Leon Battista Alberti belonged, he remarked, to a noble Florentine family; he was a gentleman and a scholar, perfectly educated, a man of admirable accomplishments, mental and physical. He wrote multifarious pamphlets, books on painting and sculpture, and the famous treatise "De Re Edificatoria," the first, and in some ways the most remarkable, of the long series of books on architecture which has continued ever since. In the Bologna edition of 1647 of Vasari, the wood-block at the head of the chapter on Alberti suggests the athlete quite as much as the scholar, and wonderful stories were told of his personal prowess. He pursued sport as he pursued literature and art, for the intrinsic pleasure he found in his art, and in the realisation of his own energies. The net results of this unusual combination of qualities were traceable in his architecture. There were two sides to his character—an austere reserve and fastidious taste on the one hand and the adventurous instincts and robust judgment of the sportsman on the other, and in the end Alberti's innate force of character won the day. In the first instance, Alberti approached his art from the point of view of the scholar rather than from that of the architect. He was exercised about the exact parts of design according to the Classical models, as he had come across them, and his enthusiasm for the antique led him into difficulties from which a more intimate study of architecture would have saved him. He was an alert and a many-sided man. He probably outgrew his early subjection to the antique, and became interested in the forms and methods of architecture for their own sake, for with all their professed veneration for the teaching of the ancients, the earlier Italian

artists used their own judgment with the utmost freedom. Alberti's distraction of mind was visible in his architecture. It was not always pleasing, but there was no pettiness about it, and it was a serious attempt at individual expression. He transformed for Sigismondo Malatesta the Gothic church of San Francesco at Rimini. He filled the interior with marbles and sculptures of the heathen gods and goddesses, of children, of fruit and flowers and of all that told of the new delight in life; and began a façade with triple arches and a mighty pediment which was to rival the temples of ancient Rome. Few buildings were more characteristic than San Francesco of the earlier Renaissance and of Malatesta himself and his architect. It was a sheer attempt to translate modern thought into terms of paganism. The same instinct for larger and more liberal forms was seen in the great church at Mantua, which, in spite of later additions and its painted simulations of architecture, was still one of the finest churches of the Renaissance. In Alberti we were brought face to face with a new type—a man of high position and complete education, who had devoted himself to architecture from simple love of the art, and who was able to show in his own works the qualities of reserve, personal dignity and contempt for trivialities which marked him out from other men. Alberti almost alone among the men of his time was thinking in terms of architecture, was aiming at getting out of architecture its own peculiar qualities, and making his appeal by form and rhythm—above all by the subtle beauty of scale. The lecturer next reviewed in detail the life and work of Baldassare Peruzzi, of Siena, who was throughout life an extraordinarily unlucky man. He was a man of simple-minded devotion to his art, ever seeking for fresh combinations of beautiful forms, ever refining on his own inventions, without losing touch of the essential elements of greatness in design. His work as a decorative painter, his skill in perspective, his keen eye for spectacular effect, and his remarkable originality in the design of scenery and the staging of plays, all combined to fill the mind of Peruzzi with infinite visions of architecture. Few things are more surprising in Peruzzi's work than the way in which, with the inexact archæological equipment of the Renaissance, he arrives at the refinement of detail and austere selection of form which had more of the true Greek spirit than the neo-Greek revival of much later times and greater knowledge. In this regard Peruzzi stood almost by himself among the architects of the Renaissance. He alone among them saw the possibilities of Greek detail under the brilliant sky of Italy. He dealt with the traditional forms of Classic architecture with the confident freedom of a master. Detail with him was only a means to an end—that of reinforcing the central intention of his design and of driving home the sense of scale in his building. To produce the effect of great size was one of the first qualities of architecture, and no building had been more successful in this than Peruzzi's Palazzo Albergati at Bologna. It was a great loss to architectural history that his design for the completion of St. Peter's at Rome was never carried out. His weak point in design was the display of the skill he possessed as a painter; and it was not until his latest days that he shook himself free from the snares and pitfalls of the sister art. In his mature work, however, he avoided that theatricality which was always the danger of Italian architecture. Peruzzi was indeed, the real artist at work in architecture. His art became the revelation of his own character in its strength and subtlety, its delicate refinement, its constant instinct to press forward in the path of architectural discovery. He was the type of the artist who stood aloof from worldly success, and whose aim was steadily set on the finer qualities of life. In conclusion Mr. Blomfield addressed the students as follows:—"It is your privilege as artists to follow Peruzzi in this. In whatever circumstances you find yourselves, you are there artists to watch for and realise the finer and rarer qualities of life; to see the unobvious, to play the part of the interpreter, even it may be of the seer. It is the function of the tradesman to satisfy fashion; it is your business to see further ahead, to disentangle the permanent interest, even if only in our own small corner of existence and to endeavour to render it vital for all kindred spirits. This it is that gives distinction to the artist's calling. Tricks and dexterities leave us untouched. It is the personal contribution of a thing once keenly felt, the individual passion, the rare moment of illumination, that differentiates the artist and justifies his existence, if not now, at any rate, in the

ture. It is on this point that we, as artists, must keep our eyes fixed, without regard to the temptations of advancement and the allurements of immediate fame.

GLASGOW INSTITUTE OF ARCHITECTS.

AT the quarterly meeting of the Glasgow Institute of Architects (Mr. J. M. Munro, president, in the chair) was reported that a letter had been received from Mr. Keppie resigning office as a representative of the Institute in the governing body of the Glasgow School of Art, in view of his firm being likely to be appointed architects of the new building, and that the President had been unanimously elected as the representative in place of Mr. Keppie. A letter was read from the Royal Institute regarding the Glasgow School of Architecture examinations, intimating that if an external examiner were appointed to be present at the examinations they would be prepared to accept the diploma or the senior certificate of the Glasgow School of Architecture as exempting candidates from the preliminary and intermediate examinations of the Royal Institute. This was remitted to the joint committee of the School of Architecture for consideration and report.

Mr. Watson, convener of the committee appointed to consider the Glasgow Corporation's proposals regarding the duties of clerks of works, reported that his committee had communicated with the allied societies regarding the duties of clerks of works in their own districts, and had received from these societies replies dealing with the subject. He further stated that his committee had now fully considered the whole matter, and that they were of opinion that the proposals of the Corporation were objectionable in general, and that clauses 4, 5 and 6 of the proposals were specially so. The meeting agreed with the sub-committee's report, and recommended that the sub-committee be appointed to meet the Corporation's committee and explain the Institute's position.

The President stated that it was intended to commemorate the jubilee year of the Edinburgh Architectural Association by an exhibition in the rooms of the Royal Scottish Academy, Edinburgh, during July and August next. The exhibition would be limited to work executed during the past fifty years by Scottish architects, with the addition of such old or special work as the committee may consider of sufficient interest. An interesting incident in connection with the exhibition is the forthcoming visit of the Royal Institute of British Architects during the period in question.

HUTTON EFFIGIES.

TWO effigies with an interesting history have been returned to Penrith parish church after an absence of 187 years. Unfortunately they have both suffered during their wanderings, says the *Carlisle Journal*, for they were for an unknown number of years lying in a farmyard, or apparently uncared for among the impedimenta of a country house stable yard, while in the journey back to their original place they received knocks sufficiently hard to break off pieces of the brittle stone.

Anthony Hutton, Master in Chancery, a famous lawyer of his day, belonged to an ancient Cumberland family, and lived at Hutton Hall, Penrith. At his death in 1637 his widow had an effigy of him prepared in a soft white stone, known by geologists as "tufa," a rock formed by springs depositing magnesian limestone, found chiefly about Bonisborough. The lady went further, and provided a companion figure, also recumbent. These for more than ninety years stood in the north choir of Penrith Church, enclosed with iron gates, and bearing an inscription stating that—

"Here lies interred Anthony Hutton, Esq., who was a grave, faithful and judicious Counsellor at Law, and one of the Masters of the High Court of Chancery, son and heir of that renowned Sir William Hutton, of Penrith, and was matched in to the noble family of Sir Thomas Burdett, of Bramcourt, in the County of Warwick, Baronet, by the marriage of his virtuous sister Elizabeth Burdett, whose pious care and religious bounty hath erected the marble tomb to perpetuate the memory of such a worthy Commonwealth man, and of so dear a husband, who died the 10th of July, 1637."

The lady made her own action clear for later generations by causing to be cut on the base of the stone representing herself the following words:—

"Here lyes the Portraiture of Elizabeth Hutton, the wife of the lately deceased Anthony Hutton, who, though living, desired thus to be placed in token of her Union with him, here interred, and of her own expected Mortality."

The effigies were placed close to the family pew, and there Sunday after Sunday for thirty-six years Mrs. Hutton worshipped in full view of her own "portraiture." The figure of the man wears a legal costume, a gown with long hanging sleeves, richly laced over the upper part of the arm, the "crackling," as it would be called at Cambridge; his right arm is extended along his side, and his hand grasps his long sleeve near its end. His left arm is doubled on his chest, and the hand holds a folded paper. The gown reaches to the ground, and has a deep round falling collar, probably of lawn; the sleeves close fitting from elbows to wrist, with plain cuffs of lawn or linen. The lady's attitude is similar to that of her husband, except that her left arm is extended at her side and her right doubled upon her chest. She has a ruff round her neck, a flowing veil over her head and full sleeves; her gown is gathered in at the waist by a knot of ribbons. During her widowhood Mrs. Hutton, from whose family descended the late Baroness Burdett-Coutts, was an important person in the parish, bearing the cost of maintaining the fabric in the choir, besides providing for the apprenticing of a full generation of Penrith boys.

The effigies were apparently removed from the church at the restoration, which lasted from 1720 to 1722. They are believed to have been taken to Hutton Hall, and afterwards to Nunwick Hall, Great Salkeld, then the residence of Dr. William Richardson, a distant connection of the Huttons. In 1894 they were found in a sadly mutilated condition lying in the yard behind Nunwick Hall. Mr. R. Heywood-Thompson, the owner of the hall, had the effigies placed upon a raised stone base enclosed by a railing at the north side of Great Salkeld church tower. The feeling of Penrith people interested in local lore and history was that the effigies should be returned to their original place, and now, by consent of the vicars and churchwardens of the two parishes they have been removed to Penrith, where on Sunday they were objects of much interest.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the rooms of the above Society on Thursday, the 21st ult., Mr. P. A. Robson read a paper on "School and College Building," Mr. H. S. Chorley, president, in the chair.

The lecturer said:—When I titled the paper I was thinking of higher elementary schools, higher grade schools, secondary schools, training colleges and the like, but I found that I must thrust aside elementary schools with a few remarks and speak mainly of secondary schools and training colleges. First, because elementary schools are now on a scientific and economic basis which is well known; and secondly, because the rules for planning secondary schools have been twice issued in a nebulous manner which seems to imply that the subject has to find itself by gradual evolution rather than by clear directions to the promoters of secondary school buildings from headquarters. With regard to classrooms, I may remark that left-hand light is a fetish which has been unduly glorified, and in some cases it is positively bad, and in a babies' room right-handed light is preferable. I am inclined to think that the Cowper Street school in Leeds is the last of these very large schools to be built (although in London a school for 3,000 children has just been built under exceptional circumstances), and I am sure that better educational results will emerge from smaller schools better distributed. Now a word as to economy in schools. This should be effected by cube rather than by area. The only gain in making classrooms 16 feet from floor to floor is that it is possible to get mezzanine floors off the staircases. Secondary schools will be built in increasing numbers during the next few years, because we are behind other countries in this class of building. I am inclined to think, especially in country districts, that we over-window our schools. With regard to ventilation, distinction should be drawn between schools in towns and those in the country, and again between those in or near manufacturing centres and those in better positions in the same district. Of large public schools I think you will do well to study Christ's College, Horsham, for boys, and the Roedean school at Brighton for girls. The plans for the Welsh colleges or universities have been worthy of study, but the designs seem to me to miss the genuine collegiate atmosphere.

NOTES AND COMMENTS.

THE arrangements are complete for establishing next week a phylogenetic museum in Jena, which is to serve also as a memorial of ERNST HAECKELS passing as a medical doctor in 1857. A part of the funds were derived from the subscriptions given on the occasion when he reached his sixtieth year. Since that time many other donations have been received which will enable HAECKELS's great desire to be realised. He was the first authority in Germany to adopt the principle of evolution, and since then he has been its most earnest expositor. The new museum will consist of specimens arranged in such a way as to explain the doctrine with greater force than is possible in a book. HAECKELS's own collections will be deposited in the museum, and will always be accepted as having historic as well as scientific interest. It is remarkable that in the country of DARWIN, HUXLEY and HERBERT SPENCER, a museum of the same class has yet to be created. The older universities would be aghast if the proposal to erect one were placed before them. The Governmental museums cannot be said to have any definite plan, although the late Professor OWEN was to be allowed to illustrate his theory of the relations between organic beings in the large hall of the Natural History Museum. Germany, which is fettered in many ways, is allowed greater freedom in sustaining theories than is possible in England, and on that account the example set by Jena is not unlikely to find imitators in other universities.

PASSY is a pleasant suburb of Paris which is easily reached. It has an historic society, and the members wish to prove their utility by setting up a plaque on the house in the Avenue Ingres which ROSSINI, the composer, had erected, which he occupied during ten years and in which he died. But if all the houses occupied by musicians, painters, writers and scholars in Passy are marked in that way the town would present a curious appearance. For over a century and a half it was preferred by literary and artistic celebrities before all the other places about Paris. Passy and Ranelagh may be considered as inseparable, for a stranger would now find a difficulty in discovering the line of separation between them. The city of Paris had offered a site for a house and garden to ROSSINI gratuitously, but he preferred to pay the small sum of 15 francs a metre for the ground. The composer brought out his best works in Paris, and he bequeathed a sum sufficient to produce an income of 6,000 francs yearly for the encouragement of composers. He also founded the Maison de Retraite d'Auteuil.

ECONOMY receives reverence in Scotland from municipal bodies, and it would be well for ratepayers if their representatives accepted the truth that if pennies are guarded the pounds may be left without special protection. The expenses of deputations and representatives always cause discussion, and several of the Scottish corporations have been considering their obligation to send delegates to the congress of the Royal Sanitary Institute and the congress of the Royal Institute of Public Health. To the ordinary member of the health committee of a corporation the objects of both are similar, and not only money but time would be saved if the business of both could be unified and shortened. A conference was held in Edinburgh on Monday, which was attended by representatives of the corporations of Edinburgh, Glasgow, Dundee, Falkirk, Dunfermline and Kirkcaldy, when the following resolutions were unanimously adopted:—"That in the opinion of this conference it is very undesirable that the Royal Sanitary Institute and the Royal Institute of Public Health should hold separate congresses each year"; "That a representation be sent by this conference to the Royal Sanitary Institute and the Royal Institute of Public Health, urging these bodies

to make an arrangement in future for holding a combined congress, or holding their respective congresses in alternate years;" and "That those corporations which have agreed or may agree to send delegates either to the Royal Sanitary Congress or the Royal Institute of Public Health be requested to ask their delegates to support the representation of this conference when it comes up for consideration at their respective congresses." This Scottish example is worth the consideration of local authorities in England.

It would be presumptuous to offer advice relating to business to a firm so well established as JOHN BARKER & Co., LTD., Kensington. Architects are able to realise the strength of its resources, and occasions are constantly arising in which the co-operation of the firm would be desirable. But when it is found that the firm appeared in the High Court claiming fees as architects, although on reduced terms, human nature must rebel, and JOHN BARKER & Co., LTD., is likely to be regarded as a doubtful auxiliary, although there may be no direct evidence on the point. Mr. Justice PHILLIMORE, who tried the case, had no difficulty about the status of the plaintiffs as architects, for the amount of the claim became a case of *quantum meruit*, and the sum paid into Court by defendants was considered sufficient.

THE information supplied by the London County Council respecting the requirements of the proposed county hall is more ample than is usual with municipal bodies. The plans are on an adequate scale, and are produced in excellent style. The contest may now be considered as having commenced, and it is to be hoped designs by English architects will be of a kind which will not make it necessary for foreigners to take part in the second competition. A great opportunity has been created for demonstrating the skill in architecture which is found in this country.

ILLUSTRATIONS.

NEW SESSIONS HOUSE, OLD BAILEY, E.C.—DETAILS UNDER DOMESTIC FLOOR—NO. 1 COURT—CITY LANDS ROOM—CORRIDOR, GROUND FLOOR—STAIRCASE.

WE have already published several views of the new Palace of Justice which was opened by Their Majesties the KING and QUEEN on Wednesday. In addition, we give five views this week. As early as 1218 there was an order from HENRY III. to the Sheriffs of London commanding them to repair the gaol of Newgate, and promising that their outlay would be repaid from the Exchequer. It is possible that some sort of a courthouse then existed near the gaol. But the earliest mention of a sessions hall was in 1357 when EDWARD III. ordered that the "Mayor of the City for the time being shall be one of the justiciars for the delivery of the gaol of Newgate, and shall be named in every commission to be made thereupon." The court, it may be supposed, was subjected to alterations whenever they were found necessary in the prison. In 1770 GEORGE DANCE, R.A., began the rebuilding of Newgate, and on its completion a new sessions house was considered to be desirable and was erected in 1785. After half a century that building was superseded by another courthouse, in which the last sitting was held on Monday last. A description of the new building appeared in *The Architect* of November 23, 1906. It is only necessary to repeat that Mr. E. W. MOUNTFORD, having succeeded in the competition, designed the building, and that the works were carried out by Messrs. HOLLOWAY Brothers as general contractors. The sculpture is the work of Mr. F. W. POMEROY and the wall-paintings are by Sir W. B. RICHMOND and Professor GERALD MOIRA. Oak panelling is used in the courts, and the carving was by Mr. G. GEALE.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. A. Needham Wilson, vice-president, in the chair.

Messrs. A. Kay and H. P. Brentnall were elected members.

The Late Mr. A. Maryon Watson.

The CHAIRMAN said before proceeding with the other business of the meeting he had to perform a melancholy duty. The Association mourned the loss of one who had taken the greatest interest in its welfare, he referred to the late Mr. Maryon Watson, who died somewhat suddenly after a short and painful illness. His death made a void in the ranks of the younger men of attainment and high promise in the profession to which he devoted his talents. The chairman alluded to some incidents in the career of the deceased. Mr. Watson, he said, was an Associate of the Royal Institute of British Architects and honorary secretary of the literature standing committee; he was a member of the Council of the Association. He was the first silver medallist in the Royal Academy schools in 1897, and gained the Institute Essay Medal in 1901. Mr. Watson also held a certificate of competency from the Statutory Board of Examiners under the London Building Act, 1894. For four years he was lecturer on the History of Architecture at the Architectural Association. He entered the office of his father as a pupil in 1892 and he visited Sicily in the same year. By the kindness of Sir John Webb the deceased had the privilege of attending at Queen Anne's Gate, and there had the opportunity of working upon the drawings of the Britannia Royal Naval College, Dartmouth, and of the Royal College of Science, South Kensington. In May 1901 he entered into partnership with his father.

A vote of condolence and sympathy with the widow and relatives of the deceased was passed.

Mr. GERALD C. HORSLEY read the following paper, entitled—

Some Aspects of Training and Design.

He said:—Some time ago a well-known writer stated at a conference of teachers that his contempt for modern education was only exceeded by his contempt for men who live up their lives to teaching, and for those—a feeble sort in his opinion—who talked about education. His sympathies were wholly with men who went forth and did things.

The speaker, perhaps, reserved his admiration for what he called the "self-made man," and we may guess that he would, had he been addressing architects on the subject of their education, have advised them to go forth and learn their work by building. He might have said, "You shall know architects by their works and you shall learn by their works." The advice, if profound, is primitive; it accords better with the events of an earlier day, when architecture was in a more experimental state than our knowledge allows at the present time. It is perfectly good advice for poets, but hardly for men whose feet are crossing the threshold of the workshop of art. These men know—even the genius among them, conscious of his gifts, knows—that they must learn their work in other ways as well as by the experience gained in actual practice. It is because I believe that there is both room and need for a larger measure of preliminary training before building is undertaken than the student of architecture generally allows himself, that I venture to say anything to you to-night.

Notwithstanding the opinion of the writer I have quoted at the beginning of my paper, you will agree, I believe, with me in thinking that we architects at any rate would be justified in having any feeling of contempt either for architectural training, however much we may hope to see some things changed in it, or for the professors and teachers in our architectural schools. We know too well the good work which is being done in the face of many difficulties. Nor can we feel contempt for those who meet either to discuss methods of training, seeing that training and education are necessary in every art, and as long as progress lasts the final word on these subjects can never be said.

You may regard the subject of architectural training from different standpoints; I will only attempt to-night to all upon the effect of certain forms of training upon design.

Before making any suggestion as to what may be weak in our training, let me briefly refer to a few of its advantages and opportunities, particularly as the student of

to-day can hardly realise the value of his inheritance in means of study, compared with the opportunities which would have been open to him fifteen or twenty years ago. We may first notice the recent addition to these means in the excellent and valuable scheme of co-ordination of the principal architectural schools in the country, drawn up by the Board of Architectural Education; a scheme which has been cordially accepted by our profession, and which is working well. The different schools, which I may remind you are our Architectural Association Schools, the schools of University College, King's College and Liverpool University, are doing useful work in training. The scheme, however, is of too recent an origin for us to have a clear-cut idea of its ultimate effect upon English architecture. We believe it to be founded upon right lines, and that the result of its working will accordingly be successful as far as it goes.

In addition to the schools under the scheme are the schools at South Kensington, Manchester, Birmingham, &c., where the work done is very similar, and there are many technical and County Council schools which nearly all have classes intended for the study of architecture as well as for teaching the methods of trades and crafts found in building. These craft classes are not utilised at present by students of architecture to any extent, owing chiefly to the fact that the influence of the trades unions is at present unfortunately against the admission of anybody but members of the unions into the classes for the study of the building crafts. It has long been recognised that it would be an advantage to young architects to join these trade classes in order to obtain practical knowledge, and if by their doing so they do not keep out the workmen for whom the classes were originally founded, it is difficult to see that anything but good could come out of such an arrangement. Indeed, some years ago the committee of this Association, endeavoured to secure this advantage at a technical school near to the then headquarters of the Association in Great Marlborough Street, but the influence I have referred to was too strong, and prevented the scheme from being carried out. The attitude of the trade unions to training and workmanship has an important bearing upon architecture which deserves a paper to itself. I have not time to enter fully into it here.

To return to the scheme of the Board of Architectural Education, the principal departure from the procedure of the past is the establishment of the two years' preparatory course before the student is articulated to an architect.

In the past the student was articulated without any preliminary training—a good beginning for those who were fortunate in finding a good master. There were, indeed, classes in London at the Association, University and King's Colleges, and the good instruction given by the Royal Academy of Arts, but all these were evening classes. There were no day classes, except those for drawing in art schools connected with South Kensington.

We may therefore roughly say that the student's early architectural education depended upon the office in which he was. In a good office he would get varied experience, both artistic and practical; in a bad office he might have a similar experience to a case which I once came across in a large Midland town, where a pupil of ability had been allowed during a period of three years to do nothing but some indifferent tracings.

In spite of drawbacks of this kind, apprenticeship is universally believed to be the bedrock of any good system of architectural training, and the Board of Architectural Education very wisely retains this system, but adds to it the preliminary two-years' course in the school. Given that the pupil has made a wise choice of his office and master, apprenticeship secures many advantages, chief among which is the influence derived from tradition. This influence emanates from the master, and has been transmitted to him—in part at least—from his master.

In addition to that, there is the stimulating effect of close companionship and common interest, which may prove to be an inspiring force to the beginner.

During the term of apprenticeship the Board advises a continuance of the school course, and the theoretical knowledge acquired in the school, combined with the practical knowledge acquired in the office, ought to build firmly the foundations of power to design.

Further, the syllabus of the Board advocates the study of ancient buildings, which was so great and so essential a feature in the training of enthusiastic students five-and-twenty and more years ago; and which it is to be hoped no newer teaching organisation in the future will ever attempt to discourage. We may rival, but we can hardly surpass

the enthusiasm and devotion with which the students of this earlier period measured and drew old work, and no architect will deny that this study must take a leading position in a student's training. Unfortunately, with the growth of easy photography, some modern students appear to think that to spend valuable time in carefully taking photographs of a building is as good as sketching and measuring it. Never was a greater mistake made; it is impossible to find out the secret of the beauty of an old building without measuring and drawing it, and the sooner the 2-foot rule and drawing block take the place of the camera on these occasions the better will be the study of architecture.

One other advantage the student of to-day inherits, viz. the result of the victories in the warfare of many years past against merely paper and T-square architecture, and the threatened extinction of the arts and crafts which are part of building. The work and influence of many artists in the last century, and of societies like the Art Workers' Guild, have helped to open the office doors and bring the student face to face with the materials with which he must build.

The inner spirit of the Gothic revival of the middle of the last century led to the more general study of buildings and of the men who made them, and this great movement can place the recognition of the craftsman and the crafts to his credit.

But to return to the system of training advised by the Board. If loyally followed it should go a long way to insure a thorough training of architects, and thus bring about the extinction of the bad office and the creation of the good. It is to be noticed, however, that the Board concludes its report with the following words:—"In putting forward the syllabus the Board desires to point out that its object is to lay a sound foundation on which the student can continue his training in later years. The Board cannot contemplate the complete equipment of an architect as possible in a four years' course. Its object is to start the student on those lines of study which will best enable him to attain to some proficiency in the art and practice of architecture."

In other words, after the four years' nursing the student is to shift for himself; the Board, at any rate at present, can "only start the student on lines of study." It makes no attempt to suggest his course through later years. With the British instinct for independent action, the fabric of instruction is to be carefully supervised as regards its foundations and basement storey, but the superstructure is to be designed and constructed entirely by the novice.

Hence we shall see our students taking different paths, as their means and situations in life may dictate, after the four-years' course is over. Naturally, few of them will attempt to practice; the majority will seek for further experience in becoming assistants or improvers, or in entering builders' workshops, or as assistant clerks of works.

In conjunction with any of these developments, some will enter the Royal Academy schools, others will take up a course of work to pass the final examination at the Royal Institute of British Architects; some will travel in order to measure and draw, or work at designs which may win for them studentships or prizes. All this, good and useful work as it may be, is nevertheless disconnected and piecemeal in character; there is no cohesion in it as in the days of the four-years' course, unless we find it in the schools of the Royal Academy.

If we agree, as I presume we do, that the supreme object of our training is to create ideals and aspirations, and foster the growth of ideas in the minds of students so that the end or goal of their career will be a fine architecture, it seems unfortunate that the Board should lose touch with them just at a time when these aspirations and ideals are taking shape and ideas beginning to flourish. We must surmise that it is the purpose of the Board to extend the scope of its recommendations as time goes on.

In the meantime, as nothing comprehensive really holds the field, we are at liberty if we wish to construct theories for ourselves.

As matters stand, the four-years' course is a thorough school course, and it is a question whether the subsequent freedom of action is not the chief fault in our training of which we should take note, and if it is not responsible for some of those weaknesses in design which we would prefer not to see in any of our students' advanced competitions.

If we believe a further course called for it would have to be of a distinctly advanced character; the influences in it would have to be, above all, artistic, and constant association

with students of other arts, such as painting, sculpture, &c. would be necessary. This course would make a special point of teaching composition.

Such a scheme presupposes the existence of a great college of art—a university of the fine arts—and it is significant that the nearest approach to such a university that we have in England is contained in the schools of the Royal Academy. This is because the architectural school there (as in the better attended schools of painting and sculpture) is adapted for the advanced student and not for the beginner. We can conceive that if the admirable system of instruction which obtains there for architects were widened and extended and connection established with schools of other bodies, we would have such a university of the fine arts.

If we look abroad we see in Paris, in the senior classes of the Ecole des Beaux-Arts, an institution of this kind. It is the ambition of young architects in Paris who have passed through some years of preliminary training to enter these classes, and I propose very briefly to describe a little of what they do there, not because I suggest that we should copy all that they do, but because we may learn something from their methods.

I have some drawings very kindly lent to me to-night by Mr. Phenè Spiers which will show you the kind of work a student is expected to do in the earlier part of his training at the Ecole des Beaux-Arts, for Mr. Spiers is one of a small number of Englishmen who, for a time, were students at the Beaux-Arts.

Mr. Spiers's drawings are the more interesting as he was studying in Paris at a time when the work of French architects was deservedly greatly admired by English architects and as we cannot traverse the whole course of modern French architectural art, I have a few illustrations of work done by some of these French architects which I do not believe could have been executed without the fine training they had received at the Beaux-Arts. These works were carried out in the first three-quarters of the last century and have stood the test of time, and are admitted to be of a fine and noble character. I regret that I have not been able to get together a larger number of photographs to illustrate these works or a larger number of plans, a form of design in which the French architect greatly distinguishes himself. In passing, I may say that a study of the plans to take only one accessible book in our libraries, "L'Architecture Privée," by César Daly, makes clear the care they exercised in their design and their thorough artistic character.

I have also a few slides in the lantern which will illustrate some of the work done by French students in competition for the Grand Prix de Rome, after they have finished their course at the Ecole des Beaux-Arts.

Before showing you these illustrations may I enumerate the principles which we endeavour to impart in our training, and you will then be able to judge how very well they are exemplified in the work of these French architects.

At the risk of bad definition and the omission of something of importance, I may state them thus:—

To instruct the student—(1) In methods of building; (2) in knowledge of construction, and in the principle of good design must be founded upon good construction; (3) that any decoration of any kind forming part of design must be in sympathy with, and subordinate to, the larger lines of the architectural scheme; (4) that simplicity, breadth of treatment, fine proportion and scale must exist in a good design, and form the basis of style.

We find these principles animating such men as Du Roux, Vaudoyer, Labrousse and Duc, eighty years ago. They were winners of the Grand Prix de Rome in successive years from about 1820. They were the founders of the great school of French architecture of the middle of the last century. They were the result, apart from their special talents, of the system of architectural education founded 250 years ago by Louis XIV., and his minister, Colbert. At the same time that the Royal Society was founded in England, to promote the study of science, in which foundation Sir Christopher Wren took part, the Académie d'Architecture was founded by the King of France.

François Blondel was president, and in his first address to its members in 1671 he said:—"Are there no books treating of this subject (viz. architecture) which you ought not to read more than once, no drawings of ancient or modern buildings upon which you ought not to meditate no time nor care that you ought not to be obliged to employ in order to form in your minds the veritable and perfect idea of architecture? Let us confer together in good faith."

and communicate our thoughts for the development of architecture. For it is true that it suffices not to have a medium acquaintance with the rules of this excellent art in order to be veritably an architect, and that this quality demands the co-operation of so many virtues and different attainments that a lifetime is insufficient to acquire it."

To show the all-round character of the new Society the members at once set to work to inquire into and report on the different stones then available for building purposes. I understand this report, which took some years to compile, is a most interesting and useful work. Nor were the king or Colbert behindhand in supporting the architects. In 1666 the minister persuaded Louis to buy a palace in Rome for the accommodation of selected architectural students for purposes of study, and in order to encourage students, we learn that the king decreed—I again quote Mondel—that "the sound principles" and "most correct rules of architecture should be publicly taught two days a week" by the Academy, "in order that a nursery, so to speak, of young architects might be formed; and to give them more courage and passion for the art, the king ordered that from time to time prizes should be given to those who succeeded best, promising that a certain number of the young men so rewarded should be sent immediately, at the royal cost, to Rome, in order that nothing might be wanting to the king's part to complete their education and render them fit to act in the conduct and superintendence of the royal buildings. At the same time His Majesty commanded that during the second hour of the public lectures those sciences which are necessary to an architect, such as geometry, arithmetic, mechanics, fortification, perspective, stereotomy and other portions of mathematics should also be taught."

In so thorough a manner, more than two centuries ago, were founded the French Academy of Architecture, the Ecole des Beaux-Arts and the Grand Prix de Rome. These institutions have passed through many vicissitudes, and while students of architecture, painting and sculpture have been going regularly to Rome for their four or five years' study since the prize was founded, the Ecole des Beaux-Arts, as we know it now, was reconstituted early in the last century.

To understand clearly the condition of architectural training in France, I must refer you to the instructive article by Mons. Gaudet in the *Architectural Review* of October, 1903, and a paper by the late Mr. W. H. White, published in the Transactions of the Royal Institute of British Architects in 1883.

I am especially indebted to these authors and to the discussion which took place after Mr. White's paper for the information contained in the short description of the classes of the Beaux-Arts I wish now to give you. I include a few of Mons. Gaudet's own remarks translated from the French in his article.

The education in architecture in France is above all things artistic. While it does not neglect the teaching of scientific and purely technical processes, the end and aim of the training is to produce artists. The object of the French training is to render the student receptive; to make him fruitful in design, and imaginative. By making the training very general in character, it hopes to foster that, with which all artists should be born, namely, the gift of having ideas.

With these ends in view an important position is occupied in his relations to his pupil by the master of the atelier studio. In France a young man who desires to become an architect acquires, first of all, some knowledge of drawing and modelling, &c., in one of the smaller art schools. He then joins an atelier, much as he would an office in England; yet the difference is great, as the atelier studio for the study of architecture only, presided over by the master or patron, who is an architect in practice. It is not an office in which the master's work is done as in England. In his early days in the atelier he doubtless learns more by criticism and help freely given him, if he is a good pupil, than by the elder pupils than by the supervision of the master, who as an architect in practice would not have time to devote more than attention to his senior pupils. But the eye of the master is on him from the first, and as he makes his way forward in the work of the atelier he finds the relation between master and pupil becomes close, almost paternal. The truth is, the choice of the master under whom the pupil is placed is carefully made by the student and his parents. Once placed the master becomes to the pupil the link which binds him to the great tradition in architecture, which the French claim has never been broken

with them, and which has descended from master to pupil from the days of the Renaissance, and from the great Gothic days when man learnt from man and not from books.

This system, which encourages a devoted attachment of the pupil to the master, and the whole atelier to the master, creates an *esprit de corps* which is a great factor in the formation of a French artist.

In addition to this system of master and pupil, the ever-increasing requirements in knowledge of the architect necessitates the school. There are many art schools in France, and while we notice that these schools are always founded for the encouragement of the Fine Arts, and not alone for architecture, our inquiry must be confined to the great national School of the Beaux-Arts, in Paris.

It is the custom therefore for the pupil who has joined his atelier to prepare himself for the entrance examination into this school, and as this school includes, as its name proclaims, students of painting and sculpture, as well as architecture, the students are always associated with other artists of the future, and form a community which, even when their studies may be for a time purely scientific and technical, never allows them to forget their vocation.

The young architect in France studies in two institutions therefore, the studio and the school, and he carries with him into the school the influence of his master, as the guide of his studies. For instance, the classes in the school embrace such sciences as geometry and physics, stereotomy (or section work), strength of materials, construction, history, drawing and modelling. But the adaptation by the pupil of this knowledge artistically is influenced by the master of the pupil's atelier. Crudely speaking, while the school can teach the necessary sciences and formulæ, it cannot teach architecture in its highest sense. That is left, and must be left, to the influence of the chosen master.

So much for some good principles. Having chosen the master and joined his atelier, the young aspirant makes preliminary studies in drawing, colouring, projections, scientific work, cast drawing and modelling. These he presents for the entrance examination at the Ecole des Beaux-Arts. If admitted, he joins the second or junior of the two classes into which the school is divided.

From start to finish in the school, the student is taking part in competitions in design. These competitions are not judged solely by the masters (or professors of the school), but by a jury composed of thirty architects, whose services are given gratuitously. Twenty of these are permanent members, and are composed of members of the section of architecture in the Académie des Beaux-Arts, architect professors of the school, and artists whose distinguished careers signal them out for this distinction.

Ten are elected every year by the drawing of lots.

The students in the school are not restricted as to time, but their progress through the school entirely depends upon the number of prizes or marks obtained in the competitions, and if enough marks are not obtained they cease to be members of the school.

For instance, a student on entering is at once in the second class. Here he remains until he wins a medal or sufficient marks to promote him into the first class, with the right to participate in the senior competitions.

It is thus emulation which inspires the school. Coercive measures do not exist. The pupils are treated as men who know what is for their advantage.

The competition for admission is very keen, as the number who apply is great and the vacancies few. Those successful proceed to studies in science and art. They attend courses in mathematics, geometry and construction. The air is thick with "concours," or competitions in which the object is to obtain honourable mention in design. Some of these designs are made in the school in fixed hours, others are worked out outside, and are submitted to the jury at stated intervals. They all are intended to train the student to enter the first class, where the great competitions take place.

The courses in knowledge of materials and construction are made very thorough, and, as Mons. Gaudet says, all this demands more or less time; in fact, the sojourn in the second class alone cannot be less than two years and a half, and must frequently be more.

In the first class, the studies of the students are essentially artistic. Every two months there is a competition in a set subject, with time competitions in the school. Medals and mentions are given in these "concours," as in those of the second class. In addition, there are open for competition by pupils in the first class prizes of money founded

by patrons of the fine arts. There are also competitions in the history of architecture, in drawing from the life and in modelling.

There are also definite courses in the theory of architecture, the history of architecture, and the history of French architecture. This last course is specially intended to prepare students in the task of restoration or repair of old buildings which may fall to their lot in the future in France.

There are courses in physics and chemistry, including heating, ventilation, acoustics, light, electricity, geology, &c., and in building legislation, contracts, by-laws, &c.

Courses also which are open to the painters and sculptors, as well as the architects, are held in literature, general history, history of art and archæology.

In connection with the school there are galleries of architectural models and of sculpture, and a library open to students in the daytime and evening.

Certainly the motive force in these classes and competitions is emulation, and the reward of all this hard work and these trials of skill is acquired knowledge and developed talent, but there is a more mundane reward as well. For the students in the second class it lies in becoming members of the first class, in itself a high distinction. For the students of the first class there is the *Diplôme d'Architecte*—the Diploma.

We have seen that the first class must be a high distinction. The diploma is still beyond, and only those students in the first class who have obtained a certain proportion of marks in the different competitions have the right to offer proofs of their fitness to receive the diploma.

The student in this trial of his knowledge and fitness for this distinction proposes a subject of his own choice, which is submitted for acceptance to a special committee or jury. If approved, he proceeds to work out his design, often a matter of great labour. The work completed, it is submitted to the members of the jury, while he himself undergoes a *viva voce* examination at their hands to test his fitness as a practical architect, and he has to give evidence that he has been engaged in some practical architectural work.

This, then, is the culminating point of the French student's career. After many years of hard unremitting labour, in which he must, by the very nature of the courses of study, prove himself to be an exceptionally able and hard-working man, he has this great prize even before him still to obtain—the diploma. To make clear what an arduous course this is it is enough to say that there are only seven or eight hundred architects in France who possess the diploma.

There is, as you all know, yet another prize—the Grand Prix de Rome, open only to Frenchmen, who must be unmarried and between the ages of sixteen and thirty. This prize is not part of the *Ecole des Beaux-Arts*, but is given by "L'Institut de France." As a matter of fact it can only be a competition between the best pupils of the *Ecole des Beaux-Arts*. None other would have a chance.

The competition is carried out first by a process of preliminary competitions and eliminations, until finally ten only are chosen by a jury of architects to compete in the final competition. As you know, the work produced in this competition is in every way remarkable. The successful competitor spends four years at Rome at the Villa Medici, and is obliged to carry out some definite work in the study of architecture in Italy, Greece or the East. The student during this time is the guest of his country, and is free to promote his studies in comfort and dignity, amidst the companionship of the most gifted men of his time in the arts, and is certain of employment by the State on his return to France.

Such then is a brief sketch of the system of architectural training which obtains in France. For thoroughness and for masterly qualities it has long been pre-eminent in Europe. But all architects in France do not go through the whole of this training. Many, if they get into the second class, may not pass into the first. But our concern is not so much with the student as with the system of training which makes it possible for those who have time and talent to attain to a high standard of excellence.

I would like to quote to you some words used by the late Mr. Fred Cockerell, a late honorary secretary of the Royal Institute of British Architects, when reading a short appreciation before that Society of Duban, Vaudoyer and Labrousse in 1875. These architects were honorary members of the Institute, and they had died within a few years of one another not long before this date. He said:—

"I find in these men a high ideal, involving a high ambition pursued with a singleness of aim and an untiring energy, quite unsullied with any taint of greed. The early ambition of these men, whether they are born to ease or to toil, is not to rush into practice, but to distinguish themselves in the school, and to gain its honours and their crown—the Grand Prix. Their lives may, indeed, put us to the blush, and I cannot but feel with humiliation how great is our need of the study of them."

In conclusion, if my time had permitted I should have liked to have pointed out with more directness some features in our training where we may fairly claim some superiority over our brethren abroad. I will mention two:—(1) In the training we give our students in some forms of country and town house work; and (2) in the practice our students make, to which I have before referred in measuring and drawing the old work of their own country. The French students, we may affirm to their undoubted loss, do not measure and draw the fine ancient buildings of their country to anything approaching the extent our students do in England. A select body of French students, on the other hand, like the Prix de Rome men, do make splendid measured drawings of old work in Italy and Greece, as an inspection of the publication called "*Fragments d'Architecture*" will at once show you, but as a body, we can say that the French students do not make practice of this necessary form of study. This is a weak spot, and you can see the result of it in some of their work. But in their modern work of a monumental character, in the laying-out of a city, in the designing of civic and public buildings, in which the highest qualities of architectural art are called for, we know how they invariably succeed, and although tradition should not be so blindly followed as to stultify individual talent and invention, we surely see in studying the French methods of architectural training the benefit of a carefully planned scheme of advanced study among artists. To promote this there would be no need to give up our cherished institutions. I would not willingly change anything in the syllabus. We need not have ateliers exactly like the French. Our offices can be very good studios, and our best schools are already studios of a high order. But what we have not got, and I think we need, is a great central comprehensive school of art, preferably in Paris, of a great national character; that is to say, supported by the funds and encouraged by the approbation of the nation, and some system of studentships or other inducement which would make it easy for our best students to prolong their studies in art in conjunction with their studies in practical building work. If this could be constituted on carefully considered lines, I believe it would lead to what we all have at heart, namely, the greater knowledge of and the greater glory of architecture.

Professor F. M. SIMPSON, in proposing a vote of thanks to the author of the paper, said he would like to refer to one or two points touched upon. Mr. Horsley rather complained that the Board of Architectural Education had limited its scheme to four years, and that was not quite a correct deduction of their published conclusions. The Board regarded the four-years' course merely as a minimum term, and they did not mean that the time should be restricted at all. After four years students would be expected to continue the work of the last two years, but of an advanced character. He was sorry that the Royal Academy had agreed to admit students to their school on the two years' certificate. If they had allowed students to enter after receiving the four years' certificate there would then have been much more likelihood of the Academy becoming a real Academy for the higher work of architectural students in England. After two years' training students were not up to the standard that would enable them to take full advantage of the teaching and instruction at the Academy. If they were ever to have such an academy of architecture as Mr. Horsley had outlined, it seemed to him essential that the two years' preliminary course should be extended. He did not think two years was sufficient time to learn an outline of the subjects of which the architect was expected to have extensive knowledge. Professor Simpson suggested that ordinary schools were to blame for the backwardness of youths in such matters. How many boys, he asked, have school having done any drawings which were worth anything at all? As regarded modelling, there were only one or two schools in England that encouraged it, and they were sometimes considered as crank schools. This was that a good deal of the work which might be done in ordinary schools was neglected. In America (and he supposed

there was no country in the world where education was so well considered) students graduated from one school to another, and the method in their teaching prepared them for this. He was very glad to hear Mr. Horsley's appreciation of French art, though he had some slight doubts whether the general high level of French art was due so much to the training at the Ecole des Beaux-Arts. He felt that the excellence of French art was due to the fact that the French traditions of architectural design had never been broken, and those traditions extended over a period of more than four hundred years. Another point Mr. Horsley had touched upon was the engineering work of the French. That was one of the most important and valuable lessons to be learned from French architecture, showing, as it did, how well they could collaborate, not only with painters and sculptors, but also with engineers. The immense success of the day school of the Association was a matter of the greatest gratification not only to members of the committee, but to everyone who was interested in architectural education.

Mr. ARTHUR KEEN seconded the vote of thanks, and remarked that architectural students in the present day had opportunities in their training which were not possible a generation ago. What Mr. Horsley had told them about the Ecole des Beaux-Arts was extremely interesting, but he could not help feeling they should learn caution from it in England. The characteristics of English work were not to be learned under such training as prevailed in France. The simplicity and restraint of their own architecture were not to be mastered in a school. It was generally agreed, he thought, at the International Congress, that the domestic architecture in England had reached a very high level, and they must remember that some of the very best exponents of architecture at the present time were men who came from offices, and who had not studied in any architectural school. These men learned by apprenticeship and the study of old work. The present demand, however, was for public buildings—big and important structures—and that made it necessary for students to be properly taught all the recognised architectural features and details which belonged to imposing architecture. With regard to the Royal Academy schools, the speaker understood that the methods had changed a good deal since his own time, and he would regret very much if the Academy opened its doors to very young students. The right position the Academy should take was to offer opportunities to students who had studied for four years elsewhere, who would regard it as a finishing school. And with the three schools of architecture, painting and sculpture under one roof, the Academicians should try to bring the arts into closer union.

Mr. W. MILLARD said he did not understand why there should be so much said about designing at a time when students ought to be doing only preliminary work. A better method would be to make students learn the facts about a building, which they should appreciate as a structure, and then they should be set to produce it on paper. Preliminary work was not carried on long enough. Of course, in training students in an office a great deal depended upon the men with whom they worked, but the same could be said of the instruction given in schools.

Mr. H. P. G. MAULE said it seemed to him there were two sides to the question of architectural training: one was theoretical, and the other was practicability from the student's point of view. In any course of architectural work it was necessary to ascertain what was most suitable to individual students. He was delighted to see in the paper an insistence on four years' work before any higher course of training was taken up. There was great danger in trying to overdo the preliminary course. The chief value of Mr. Horsley's paper was the suggestion he held out that the body which should undertake the higher architectural training was the Royal Academy. There should be a clear understanding that the Academy did not try to carry on both the preliminary and the higher course of work. The schools throughout the United Kingdom were well able to provide the early training. The higher education certainly should not commence until the student had had two years' preliminary training and two years' office training. At the end of four years he should be capable of taking advantage of the opportunities offered in the Academy schools. He suggested that it would be advisable to codify the syllabus of the Board of Architectural Education. At present he thought it endeavoured to cover too much ground.

Mr. HALSEY RICARDO in his remarks said he hoped a

great deal from the Board of Architectural Education in its endeavour to start upon a substantial foundation, and also from the effort it made to co-ordinate all through England a form of teaching in education and training.

HOLYROOD CHAPEL.

THE Council of the Cockburn Association in their report for the past year refer to the proposed restoration of the Chapel Royal at Holyrood as follows:—

The munificent bequest of 40,000*l.* left by the late Earl of Leven and Melville to be applied towards carrying out the restoration of the ancient Chapel Royal at Holyrood was welcomed throughout Scotland as promising an end to the long period during which the chapel had been allowed to remain in a ruinous condition. Very divergent views were, however, taken as to the advisability or otherwise of attempting to restore the building to its ancient form. The Council carefully considered the matter, and after taking into account the various points of view from which restoration might be regarded, namely, sacred, national, historical and æsthetic, they came to the conclusion that the restoration ought to be proceeded with, and they accordingly passed the following resolution, copies of which were forwarded to the Secretary for Scotland, with the request that the same might be transmitted to His Majesty the King, and also to Lord Balcarres and Sir John Stirling-Maxwell, the trustees of the testator's will:—"That this meeting hails with the greatest satisfaction the prospect of the restoration of the nave of Holyrood Abbey Church. It regrets that this part of the building has so long been allowed to continue a desolate ruin, but rejoices in the prospect of what still exists of one of the most interesting buildings in Scotland being preserved from further dilapidation. Accordingly desires to record its high appreciation of the patriotic spirit which inspired the late Earl of Leven and Melville to make provision in his will for carrying out the restoration, and for the thoughtful care displayed in the appointment as architect to take charge of the work of Mr. Thomas Ross, than whom, in the opinion of this meeting, there is no person better qualified. Further, this meeting humbly and respectfully ventures to express the hope that His Majesty the King will be graciously pleased to consent to the proposed restoration." The Council have learned with regret that, acting upon a report by an English architect, Lord Balcarres and Sir John Stirling-Maxwell have come to the conclusion that the work ought not to be proceeded with. How far this decision is in accordance with the clearly expressed wishes of the late earl, or whether the course adopted by the trustees is in accordance with the terms of the will and the powers conferred therein upon them, will probably appear at a later date. As the question of what action should be taken by those who desire that the restoration be proceeded with is still under consideration, more than this cannot at present be said. The matter, however, will have the attention of the Council.

CHINESE PICTORIAL ART.

A LECTURE was delivered by Mr. Laurence Binyon of the British Museum, on the pictorial art of China, at the second meeting of the newly-formed China Society at Caxton Hall, London, on Thursday evening last. He asserted at the outset that painting was the supreme national art of China; that it constituted the central and typical expression in art for the whole of Asia, and especially for Persia and Japan. The latter country had found in China a new inspiration for its own arts. The carefully stippled drawings on rice-paper with which Europeans are familiar are not the real art of China, which rests on one of the great art traditions of the world. Compared with European methods there are great differences to be noted. Chinese paintings disregard shadows. They are essentially decorative and rely largely on a calligraphic quality of line. One of the interesting points of the subject is its great antiquity. As early as the third century B.C. we find a developed art of painting, and the artist's brush already perfected. In early times painting was executed on wood panels and walls, but of these old mural decorations no traces remain. About the second century A.D. the painting of landscape existed, and the names of individual artists of that period are still on record, while very shortly after the six canons were formulated which laid down principles of art never since abrogated. The salient point of these is that

therein fidelity to nature is entirely subordinated to the expression of abstract beauty. The great age of the pictorial as of the other arts of China was that of the Sung dynasty. With perhaps a somewhat too sweeping generalisation the lecturer claimed that the landscapes of this time expressed nature in a way that our painters have only dared to attempt within the last generation or so. One is inclined to think that Rembrandt's etching, "The Three Trees," for instance, might have been appreciated even by a Sung artist, and that it possessed those solitary and dramatic qualities to which Mr. Binyon bore witness, with an added sense of humanity, of the existence of which in Chinese art he hardly succeeded in convincing some of his auditors. He sketched the decadence of the Ming and succeeding periods, and in stating his conclusions pointed out that he had been able only briefly to deal with a continuous expression of art ranging over more than 2,000 years. Chinese art was weak in the plastic and architectural sense. The absence of the nude was a notable feature. It was lyrical and contemplative—expressive of thoughts and emotions rather than of the epic and the narrative, and was characterised throughout by a great simplicity and devotion to the abstract idea. The inevitable comparison with Japanese art was somewhat carefully minimised by the lecturer; but though it received more attention in the discussion which followed, the one important enlightening point of it was missed. For Chinese art is too formal and too ideal. The Japanese took its dry bones and vitalised them with an infusion of humanity—of the Oriental kind. And their painting extended into a variety of beautiful and diverse ways, of which Chinese painting, so far as we yet know it, gives us barely a hint.

Mr. Binyon illustrated his paper with some interesting lantern slides, and has inaugurated a study which should prove to be both valuable and fascinating. But much more remains to be done before we can arrive at the beginnings of definite opinion.

GUSTAVO GIOVANNONI AND CURVES IN PLAN IN THE TEMPLE AT CORI.*

By WILLIAM A. GOODYEAR.

(Continued from page 132.)

NEITHER Thiersch nor Hauck were acquainted with the curves in plan of the cornice, convex to the centre of the court, in the second Temple Court of Medinet Habou. These curves were discovered by Pennethorne in 1832, but he did not publish them until 1878. This was only a year before Hauck's publication, and the Egyptian curves were still unknown to Hauck in 1879. If the gable theory of Penrose required a final death-blow it would be furnished by the curves in plan of the second Temple Court of Medinet Habou, where there are naturally no gables. But the curves in plan at Medinet Habou also throw out of court the special theories of both Thiersch and Hauck, and this is why I have not explained them. It will not be overlooked, however, that the optical effect in the cornices at Medinet Habou is that of a rising curve in a vertical plane. At the angle of 45 degs. the spectator has the effect of a rising curve in elevation of an amount equal to that of the curve in plan. At points further removed the curve appears less. At nearer points the effect is greater and increases enormously on close approach. Thus on close approach the normal perspective curve is much exaggerated.

The theory of Thiersch, briefly stated, moves from the illusion which tends to affect the appearance of two lines meeting at an angle. These effects were cited by Penrose for acute angles, as calling for a correction under the gable. Thiersch, however, points out that, whereas acute angles appear larger than they really are, obtuse angles appear smaller. His arguments contend that the direction of Vitruvius regarding the construction of the curves was limited to those temples which stand on an elevated platform above the level of the eye. Thus, the Parthenon, as seen by a spectator looking toward one of the angles, would exhibit obtuse angles both in the stylobate and in the entablature (with the apex of the angle turned toward the spectator). These angles would appear smaller than they are, and as this effect decreases with the distance from the angle, the lines would appear to curve downward away from

the angle. This effect would be corrected by a rising curve in elevation. Hauck contested this explanation on the ground that the optical deflection of the obtuse angle was so inconsiderable that a correction would not be needed, but more particularly because such a correction would, in any circumstance, only be needed for the spectator looking toward the angle of the building, and would not be needed in views facing the front or sides. Hauck based his own theory on the fact that the intercolumniations of the Parthenon are smaller at the angles by about 2 feet, in order to admit of placing the corner metopes at the angles of the building, instead of placing them over the centre of the abacus, where they normally appear. This diminution of spacing gives an increase of perspective from the point of view facing any side of the temple from positions nearly opposite the centre. Hence, according to Hauck, if the perspective rising curves in elevation were not also correspondingly increased, the perspective effect of the columns would be out of harmony with the perspective effect of the horizontal lines. Thus Hauck in a sense returned to the explanation of Hoffer. For although he held that perspective exaggeration, for its own sake, would not have been in line with Greek feeling, he also held that this perspective exaggeration was properly sought in view of the contradictory effects otherwise produced by the necessary narrowing of the angle intercolumniations. As the title of Professor Hauck's monograph indicates, he supposed that the Greek curves were confined to the Doric style, in which style alone the angle intercolumniations were reduced in order to allow the triglyphs to be placed at the angles of the temple. Since that date the discovery of curves in the Ionic temple at Pergamus would have spoiled his theory, but it is also wholly unavailable for the interior curves of the second Temple Court at Medinet Habou, which are convex in plan to the centre of the court. As far as the theory of Thiersch is concerned, the openings of the obtuse angles in the interior of the court at Medinet Habou are turned toward the spectator, not away from him (as in the exterior of a Greek temple). The angle illusion, if any were produced, would therefore be a rising curve in elevation, and would thus need no correction. Although the theories of Thiersch and Hauck are no longer tenable, their publications still have great interest and importance as critiques of the theory of Penrose and otherwise.

It ought perhaps to be added that the theory of Thiersch is the only one which has ever even been offered to explain the account of Vitruvius. Although the explanation of Vitruvius has been otherwise universally discarded or (more generally) ignored, the meaning of his explanation certainly ought to be susceptible of explanation, even if the explanation be not correct. Vitruvius directs that the stylobate of the temple shall be built with a rising curve in elevation lest it appear "alveolated" (like the bed of a channel) and the curves of the entablature are considered as a mere outcome or logical sequence of the stylobate curve. Thiersch moves from the fact that Vitruvius is speaking of temples resting on a *podium*—that is, above the level of the eye of the exterior spectator—and that the effect of sagging from the exterior point of view was to be counteracted by the curve. I will venture to suggest that Vitruvius is speaking of an effect of "alveolation" for the spectator standing on the platform. It is a logical result of the laws of curvilinear perspective that all plan surfaces below the level of the eye must tend optically to "dish," that is, to appear like a dish or bowl. Aeronauts find this appearance in the earth's surface when raised above it in a balloon, for the same optical reason. The same optical laws explain the dome-shaped appearance of the sky. Thus, although the explanation of Vitruvius is certainly insufficient to cover the known facts, it appears to be a common-sense and practical explanation, which deserves recognition and mention among the many which have been offered. The explanation of Vitruvius is additionally interesting from the fact that it is not simple: the outer porticos of the Parthenon which have the stylobate curves. The entire platform of the temple is delicate: hemispherical, or, as the French would say, *bombé*.

Still another argument against the gable theory of Penrose is furnished by the Brooklyn Museum surveys of 1899. The photographs, taken under my direction, of the Temple of Concord at Girgenti, show that there are rising curves in elevation on the flanks, but no curves under the gables. Hence the curves of the flanks could not well be an afterthought derived from the curves under the gables, since the latter do not occur in this temple. This very important

* A paper read before the Archaeological Institute of America at Washington, January 2.

argument against the gable theory of Penrose has never been adequately published.

Penrose has based his argument for the derivation of curves on the flanks of a temple from the curves under the gable, from the high antiquity of the Neptune Temple at Paestum and from the supposed fact that this temple had curves under the gable but none on the flanks. Thus, for Penrose, the Neptune Temple represented the primitive type of the Greek curves, but he was ignorant that Jacob Burckhardt in his "Cicerone" has announced constructive curves in plan convex to exterior on the flanks of the Temple of Neptune. These curves were photographed for the first time by the Brooklyn Museum surveys of 1895.

From the preceding summary two results are fairly well established. First, the popular impression that the Greek curves were intended to make the lines look straight, and to correct effects of sagging supposed to be inherent in straight lines above the eye, is without authority, as far as the quoted experts are concerned, and the theory of Burnouf,* in the "Revue Générale de l'Architecture" for 1875 is too fanciful to require more than passing mention here. The second result is this. As far as Penrose is concerned, he only suggested a sagging effect under the gables at the ends of a temple as the explanation of the curves. Against this theory the following points may be urged. It has not been accepted or favourably mentioned by any French or German expert. It has been vigorously opposed by two distinguished experts in optics, and the theory of Hoffer is also opposed to it in principle. It is finally thrown out of court by known facts in Egypt and at Girgenti.

We are now able to return to the discovery of Professor Giovannoni at Cori.

Popular impressions are not so easily blighted as scientific or archæologic theories. Every man in the street who has heard of Greek curves will tell you that they were meant to make the lines look straight, and will so continue to tell you long after the publication of Professor Giovannoni's discovery. But considered as a scientific or archæologic theory the discovery at Cori disposes of the gable theory of Penrose for all time, for the simple reason that this curve produces a sagging effect in the upper horizontal line and therefore could not counteract one.

But the discovery does far more than this; it forces a revision of most of the other theories on Greek curves and widens our views regarding them to a remarkable extent. And before I take up this phase of the subject, I wish to point out the possibility that the curves at Cori may not be the only ones which are concave to the exterior even in existing Classic monuments.

Pennethorne observed curves in plan concave to the exterior in the upper entablature at the ends of the Parthenon. Hoffer explicitly described the same curves and measured them. The plan of these concave curves, with measurements, is published in the "Wiener Bauzeitung," of 1838. Hoffer described these curves in plan as beginning in the capitals, as continuing in the entablatures and cornice, but as not being found in the tympanum. They amount to about 2 inches only at the cornice. Penrose quotes the observation of Pennethorne and gives his reasons for believing the curves to be accidental. In deference to Penrose, Pennethorne in 1878 adopted his view that these

curves were accidental. The argument of Penrose is that the gaps between joints were greater in the rear than in the front. Hoffer's observation that the tympanum surface is a straight line would appear to suggest that the curves above and below it could hardly be due to accidental movement. No decision on such a head can be reached or even suggested in this paper, and the explosion which ruined the Parthenon is not to be forgotten; but it is surely worth remembering, in face of the concave curves at Cori, that concave curves in the Parthenon gable fronts were observed, measured and published in 1838 by Hoffer as constructive.

There is another observation on this head. In 1895 I observed curves in plan concave to exterior in the eastern pediment of the Temple of Neptune at Paestum, and they were photographed in 1895. This photograph shows the concave curve in the line of abaci as well as in the cornice. I have never previously published these facts, for lack of time and opportunity, but I was moved by the observation at Cori to make it known to Professor Giovannoni and to send him a photograph. This observation has been laid before the Roman Society by Professor Giovannoni at their session of November 6, 1906, and the President of the Society has been kind enough to write me a congratulatory letter on this subject. It appears to me of high importance that the curve in plan at Paestum concave to exterior should be carefully examined by experts on the site. Whatever the result at Paestum might be, the curves at Cori still remain the first conclusively demonstrated constructive curves in plan, concave to exterior, which have ever been found in the construction of an ancient monument.

(To be concluded.)

CO-OPERATIVE EFFORTS IN BUILDING.

THE true work of art, the true masterpiece of reasonable and manly men conscious of the bond of true society that makes everything each man does of importance to everyone else; the unit of the art, this house, this church, this town hall, built and ornamented by the harmonious efforts of a free people; by no possibility could one man do it, however gifted he might be, even supposing the director or architect of it were a great painter and a great sculptor, an unfailing designer of metalwork, of mosaic, of woven stuffs and the rest—though he may design all these things, he cannot execute them, and something of his genius must be in the other members of the great body that raises the complete work. Millions on millions of strokes of hammer and chisel, of the gouge, of the brush, of the shuttle, are embodied in that work of art, and in every one of them is either intelligence to help the master or stupidity to foil him hopelessly. The very masons laying day by day their due tale of rubble and ashlar may help him to fill the souls of all beholders with satisfaction, or may make his paper design a folly or a nullity. They and all the workmen engaged in the work will bring that disaster about in spite of the master's mighty genius unless they are instinct with intelligent tradition; unless they have that tradition whatever pretence of art there is in it will be worthless. But if they are working backed by intelligent tradition, their work is the expression of their harmonious co-operation and the pleasure which they took in it. No intelligence, even of the lowest kind, has been crushed in it, but rather subordinated and used, so that no one from the master designer downwards could say, This is *my* work, but everyone could truly say, This is *our* work. Try to conceive the mass of pleasure which the production of such a work of art would give to all concerned in making it, through years and years it may be (for such work cannot be hurried), and when made there it is for a perennial pleasure to the citizens to look at, to use, to care for from day to day, from year to year. Is this a mere dream of an idealist? No, not at all; such works of art were once produced, when these islands had but a scanty population, leading a rough and to many a miserable life, with a "plentiful lack" of many, nay most, of the so-called comforts of civilisation. In some such way have the famous buildings of the world been raised, but the full expression of this spirit of common and harmonious work was given only during the comparatively short period of the developed Middle Ages, the time of the completed combination of the workmen in the guilds of craft.

M. R. Brandon, of Paris, has been successful in the competition for the Khedivial Bourse at Cairo.

* Even the briefest mention of Burnouf ought not, however, to omit to give him credit for having, alone among modern authors, given the correct explanation of the *scamilli impares* of Vitruvius. Penrose supposed that the *scamilli impares* were the drums of the columns which rested on the stylobate. These drums, in the Parthenon, are of unequal height on opposing sides. Otherwise the columns resting on the curved and sloping surface would lean away from the centre of the temple. This interesting proof of the intended construction of the curves is not, however, the true explanation of the *scamilli impares*, by means of which the curves were to be constructed. Even in the second edition of his *Principles of Athenian Architecture*, published in 1888, Penrose was still ignorant of the obviously correct explanation offered by Burnouf in 1875. It is significant of the general neglect by archæologists of the subject of Greek curves that Burnouf's explanation has not even been alluded to by any other authority. Burnouf points out that *scamillus* is a diminutive of *σκάμνον*, and may be translated as "a little stool." Burnouf says *un petit banc*. These little stools were the small pyramid-shaped sighting blocks which are still used in France for levelling a line of steps or a masonry platform. If placed in graded unequal sizes, gradually increasing in height from the centre toward the extremities of the line of steps, such *scamilli* could be used for constructing a curve, and, as Burnouf says, it was as easy in antiquity to construct a curve with these implements as it now is to build to a level. He also points that such *scamilli impares* must have been used for building curves in plan.

HOSPITAL PLANNING.

A LECTURE on "Hospital Planning and Construction" was delivered by Mr. Alex. Cullen at a joint meeting of the architectural section of the Royal Philosophical Society and the Glasgow Architectural Association. Mr. R. D. Sandilands presided. In the course of his paper the lecturer traced the history of the hospital from the time it was attached to the Church, and described the different types of present-day hospitals. He pointed out that while the different types might vary in plan, yet the same general principles of sanitation were involved. The planning and construction of a hospital for infectious diseases was then discussed. The lecturer showed by diagrams how the ward pavilions should be placed on the site in order to obtain the fullest amount of sunshine. The character and use of the several buildings were described, and the lecturer urged the combining of simplicity with efficiency, as these were the essential elements in hospital construction. In planning the architect should at the outset carefully study the problem and obtain a definite and clear idea of the purpose the building had to fulfil. Then he should direct all his thought to make the plan meet the requirements. A good plan invariably formed the basis of a fine elevation, and it was possible to make a plan artistic as well as an elevation. The principal points to observe in construction and the most suitable materials to use were also fully described, and the lecture was illustrated by lantern slides.

A Durable Building Stone.

SIR,—Would you kindly allow me to inquire if some of your readers could recommend me a building stone that may be relied on to resist the atmospheric conditions of certain of our cities and industrial centres. There is not in my experience a really durable building stone on the market at a reasonable price, prompt delivery guaranteed. Some of your readers probably know a building stone, however local, that can by its use in ancient buildings or otherwise prove its reliability. Thanking you in anticipation, I am, yours faithfully,

J. J. M.

February 25, 1907.

GENERAL.

Professor Alfred Messel has been appointed architect to the Royal Museums in Berlin.

The "Blue Gown," by Mr. George Henry, A.R.A., which was exhibited last year, has been acquired for the Public Gallery of Cape Town.

The Lord Mayor has consented to open the International Building Trades Exhibition at Olympia on Saturday, April 6. Sir A. Webb, R.A. will propose the vote of thanks.

A Petition was presented in the House of Commons on Monday from the trustees of the British Museum praying for a further grant for that institution.

Architectural Designs for the Salon Exhibition (Société Nationale des Beaux-Arts) are to be lodged on March 16 and 17. Members are allowed until March 28 and April 3. Designs for the rival Salon are to be lodged on April 4 and 5.

An Earthenware Vase, containing some 300 brass Roman coins, has been found in a brick-field at Goring, near Worthing. The coins are in good preservation, but are smaller than the mould from which they were struck, and therefore do not exhibit, except in a few instances, the inscriptions. The coins are of a common Roman type, some thousands having been found along the Sussex coast.

Two of the Niches in the great altar screen in Southwark Cathedral have been filled by Mr. W. A. Bell's gift of figures of Peter de Rupibus, who in 1207 erected the Early English nave, and of St. Olaf, who delivered London in 1008 from being sacked by the Danes.

The Lancashire Education Committee have approved of plans for a new day school at Great Harwood, to accommodate 900 children. The building will be of two storeys, and the school will be in three departments, one of which will be for manual instruction and domestic work. The estimated cost is 16,000/.

The University Court of St. Andrews met on Saturday, and it was reported that Mr. R. S. Lorimer, A.R.S.A., had prepared plans for the addition to the buildings of the library to be erected at the cost of the fund gifted by the rector, Mr. Andrew Carnegie, LL.D., for that purpose, and the court directed that specifications on the basis of these plans should be prepared with a view to arranging for the building being commenced as early as possible.

A Question was asked in the House of Commons on Tuesday whether the number of Royal Academicians could not be increased, as hardship arose from the difficulty of election. The Chancellor of the Exchequer, in reply, said that the Government have no control over the Royal Academy, and therefore his right hon. friend could hardly undertake to make the representations suggested in the question.

The Exhibition of paintings by distinguished Danish artists will be opened at the Guildhall Art Gallery on Tuesday, April 9. Among the contributors of pictures to the exhibition are Queen Alexandra, the King of Denmark, the Czar of Russia and the representatives of the late King Christian of Denmark.

The Report of a sub-committee having been considered at a meeting of the Lord Provost's committee of Edinburgh Town Council, it was decided by eight votes to five, after hearing a deputation from the markets committee asking for reconsideration, that the new art school should be built as a whole and not in sections.

The Libraries Committee of Glasgow Corporation report that, in consequence of extensive remains of old buildings having been found embedded in the site of the new Mitchell Library in North Street, the new foundations will require to be carried to a greater depth than was originally expected, and as the character of the strata at the greater depth is less satisfactory than was indicated by the trial pits which were sunk to ascertain the nature of the subsoil, the concrete foundations are to be increased in breadth so as to prevent any possibility of settlement when the building is erected.

The Liverpool City Council have adopted by a large majority a proposal of the finance committee to celebrate the 700th anniversary of the grant of a charter to Liverpool by King John, and making an additional allowance of 2,000/ to the Lord Mayor.

The Scottish Faculty of Advocates have formally approved of the plans which have been submitted by the Treasurer for the extension of the Court of Session. According to the scheme the number of courts will remain as at present. An entirely new large court-room will be built to the south of the present structure, but one of the existing outer house courts will be abolished to make room for a passage leading to the new block of buildings. Part of the space thus saved will be utilised in extending the present eastmost court. Increased accommodation for judges and jurymen will also be provided. The estimated cost of the work is 22,000/. Nothing can be done until the estimate has been passed by Parliament.

The Stockport Town Council held another meeting in committee last week for the purpose of considering the revised Kinder waterworks scheme. It was decided to proceed with the excavation of the remaining portion of the tongue trench, and to make such trial holes for the win trenches as may be considered necessary by the engineers. The cost of the work, which is to be carried out by administration, not to exceed 12,000/. Messrs. Hill & Sons, the engineers, were instructed to prepare as rapidly as possible the plan for the earth dam. The question of appealing in the case of Kellett v. the Corporation, in which the plaintiff was awarded 52,546/., including 29,400/ for breach of contract, was also brought forward, and the waterworks committee were asked to consider the matter and report the opinion.

The Council of the Society of Arts are prepared award, under the terms of the Benjamin Shaw Trust, gold medal or a prize of 20/. The medal is to be given "For any discovery, invention, or newly-devised method for obviating or materially diminishing any risk to life, limb, or health incidental to any industrial occupation, and previously capable of being so obviated or diminished by any known and practically available means." Intending competitors should send in descriptions of their inventions not later than December 31, 1907, to the Secretary of the Society of Arts, Adelphi, London, W.C.

The Architect.

THE WEEK.

WHENEVER a misdeed can be ascribed to an architect, he receives scant mercy from journalists. The outcry against the late ALBERT THOMAS is an instance. The unfortunate man was one of the architects of the French Government, he was an officer of the Legion of Honour, and until two years ago he had charge of the Grand Palais, part of which was erected from his design. He had obtained the Prix de Rome in 1870, and for many years he was much respected. Unfortunately, of late years he was affected by a common form of mental disease—kleptomania. Finally, he became paralysed, and in that state he had no recollection of what he had done. From his official position he was allowed access, not only to the national archives, but to the collection in the Ecole des Beaux-Arts. M. LESOUFACHÉ, the architect, had enriched the latter with drawings and engravings of eighteenth-century architecture, including original drawings by BLONDEL. M. THOMAS, either with or without permission, was allowed to take many of the volumes and portfolios to his own house. Having temporary possession as if they were his own property, he cut engravings from the volumes to which they belonged, in order to arrange them on a different plan. After the death of M. THOMAS a part of his library was sold, and the bookseller who purchased them was not long in perceiving that some books were national property, and returned them to the library of the school. Madame THOMAS made a further search and discovered thirty-nine other volumes, which were also returned through the agency of M. BONNAT, the painter. An official inquiry is now in progress. M. THOMAS was a candidate for election to the Academy of Fine Arts, and it is not to be supposed that any sane man who was ambitious of that distinction would run the risk of robbing an institution which is so closely connected with the same academy. His mania for acquiring things was latterly so strong that he took possession of an iron gateway and, as one of his friends remarked, he would have carried off the two towers of Notre-Dame if the task were feasible. Architects have no immunity from psychological degeneracy; they must share in the common lot; and when so distinguished a representative of the profession as the late M. THOMAS lapses, his fall should give rise to pity rather than to the creation of landers.

At one time the question whether a ladder was a "scaffold" under the Workmen's Compensation Act repeatedly arose in the county courts. Another instance had to be considered in the Preston County Court on Tuesday. The widow and children of a plumber who was killed in December by falling from a ladder sought compensation from Messrs. WILDING & SON. The man was engaged in cleaning a gutter of a house and descended the roof from which he fell. The repair of the gutter was accomplished by another man who stood on a ladder which he considered to be necessary. It was contended on behalf of the defendants that cleaning a gutter was not repairing a building within the meaning of the Act, and the ladder was only required to enable the man to reach the roof for the purpose of examining the gutter, and therefore was not a scaffold. Judge JAMES HAMILTON decided that the building was being repaired, that the ladder served as a scaffold, as the working could not be carried out without it, and that the claimants were entitled to 225% compensation. The Court of Appeal has already decided that it was a question of fact whether scaffolding was employed. If anything served that purpose and was a support the right of the workman came in, and he was entitled to compensation.

THE new municipal art school of Edinburgh is to be erected on the site of the cattle market in Lauriston, which is not far from Heriot's Hospital. The market is a source of profit, and the city has been enriched by it during the last ten years to the extent of 38,000/. To eject the dealers all at once in order that the school could be erected under one contract would not be a wise proceeding, and a discussion on the subject occupied some time at the last meeting of the Town Council. The Lord Provost considered that not only would it be more convenient to have the new buildings erected at one time, but it would be breaking faith with the Government if the arrangements were not completed by March 31. The market committee considered that if one-half the buildings were undertaken, that would show the intention of the Council to avoid delay, but it would also allow of some business being transacted in the cattle market. It was also declared possible to accept the whole estimates for the school and to arrange with the contractor for the erection of the buildings in two sections. Thirty members agreed in favour of a partial retention of the market, while only seventeen agreed with the Lord Provost's proposal to have the work carried out in its entirety.

THE earthquakes at San Francisco and at Kingston have caused much alarm among some of the American insurance companies. There is no question that clauses were found in policies by which the offices expected to escape earthquake liabilities. But it was observed by a judge in the Californian Court that ordinarily we do not look for ellipses in insurance policies. An ellipsis is suggested here to be supplied by reading in antecedent words. Whether it was so made intentionally and the clause left in obscurity for ulterior purposes, or accidentally by inaccuracy of statement, neither of which we have the right to assume, the fact remains that the most important clause in the whole policy is left sufficiently obscure to render it in marked contrast with the other clauses, which limit liability by the use of apt and appropriate words." The belief is becoming more general that earthquakes may be anticipated as a possibility in a much wider region than was hitherto recognised as volcanic. The way to meet the contingency would be through an increase of insurance rates. But the competition between offices is too intense to allow of much addition to the former rates, and in the United States especially the usual charges do not provide for catastrophes.

FROM the report of Consul-General ROLFE it appears that much discussion took place after the eruption of Vesuvius as to the desirability or otherwise of rebuilding the destroyed towns, as it was thought by many that it would be better to select a site in the plain further away from the mountain and with greater railway facilities. This plan met with strong opposition from the population, who insisted upon actual rebuilding of their old houses. They consequently set to work, and it is astonishing to see with what rapidity these towns are being rebuilt, and it is more surprising still to see a number of new houses springing up in the immediate vicinity of the Ottolano station, where the destruction of the adjacent houses was as wholesale as anywhere. In fact the close of 1906 saw a very large portion of the inhabitants installed again in their old homes, so that it is safe to predict that in the course of a year from date of what appeared to be their absolute destruction both Ottolano and San Giuseppe will rise again from their ashes. The disastrous eruption of Vesuvius and the continuance of the Calabrian earthquakes have not only had the effect of swelling the tide of emigration to the extent of depopulation in some cases, but have effected the curious change that the agricultural population of the central provinces is migrating to the south in search of work.

IN THE YEAR 1707.

THE year 1707 could be shown to possess great importance for Great Britain by a political historian. Among the events was the completion of the union with Scotland, which in many ways, unlike that with Ireland, has been a reality. It was also in 1707 that important military events took place in Spain, in which England bore a part. In the history of literature the birth of HENRY FIELDING was suggestive of the opening of a wide field in which Englishmen have gained success. But our task is to mention some occurrences which are usually passed over in all accounts of the time.

CHRISTOPHER WREN was then a high official. In January we find him reporting to the Lord High Treasurer concerning the removal of the secretary's office in the Cockpit from the ground floor to an upper floor. The building was then one of the principal seats of office, but it was not originally arranged for the purpose. WREN not only made suggestions about carrying out the desired alterations, but he prepared designs and proposed that as danger might arise to the letter books and other documents, it would be wise to preserve them in portable presses. Another time we learn that WREN was in consultation with the Speaker about the enlargement of the House of Commons, and recommended that the difficulty could be overcome by having an additional row of seats in the galleries, which would not cost more than 270*l.* It is evident that he was no less efficient when dealing with small matters than with great architectural works. Another report of WREN's related to the dues charged on Portland stone. For every ton of stone shipped at Portland, unless it was to be used for royal palaces or stated Government buildings, a duty of 12*d.* per ton had to be paid. The islanders received 9*d.* for the poor, and the receiver of land revenue for Dorsetshire took the remaining 3*d.* The duty was levied on all the stones used for St. Paul's and the Chelsea College. Some quarries appear to have been granted to the Dean and Chapter of St. Paul's, and WREN was empowered to give licenses to quarrymen for working them. But for stone taken from their quarries for other purposes the Dean and Chapter were entitled to 6*d.* a ton. From a second report it is evident that some of the quarrymen were not disposed to recognise QUEEN ANNE's right to the whole of the quarries, for new ones were opened without permission. WREN accordingly appealed to the Lord High Treasurer asking him to lay the matter before the Attorney-General, in order that such a course might be adopted as the law allowed. WREN explained that as the quarries yielded much larger and finer blocks of stone than were to be found elsewhere, great care had always been taken to preserve them from waste and to prevent abuses by irregular working.

A report by JAMES MONTAGUE places the Portland case in a somewhat different light. According to that official the duty of 12*d.* had been paid time out of mind, one moiety going to the king or queen as lord of the manor, while the other went to the profit of the inhabitants. In 1665 CHARLES II. altered the arrangement, and only 3*d.* went to the Crown and 9*d.* to the inhabitants. It was said that WREN, in ordering the stone for St. Paul's and Chelsea College and the new churches in London, did not announce that the stone was for the Crown, and therefore the inhabitants received 9*d.* a ton for their own benefit. MONTAGUE considered that the payment should be continued, and that WREN had no authority for believing that stone which was not employed in Crown buildings should be exported duty free. Apparently MONTAGUE thought that the old practice of the inhabitants was preferable to any of WREN's innovations.

The strangest of all the reports which WREN wrote during the year related to an engine which ejected an inflammable liquor. In less than a minute the stream of fire burned an old door very furiously which was at some distance, and would soon have consumed it if the

engine was not so small and contained little of the material. WREN considered the design might become useful to the public, but whether in peace or war was not explained. A grant of 200*l.* was allowed towards the preparation of a larger engine.

At that time the importance of the Navy was shown by the necessity of conveying troops to Spain, where the War of Succession was raging. The Forest of Bere was Crown property, and the warden proposed to cut down 300 trees for the use of the Navy. WILCOX, an official who was much employed in connection with the forests, was asked to report on the subject. He stated that the warden contemplated selling the trees to the Navy for his own advantage. Probably in doing so a common practice was followed. The Commissioner of the dockyard at Portsmouth, on the other hand, wished to have the trees felled at once. He contended that all timber which was to be converted for shipping, and which was cut when the sap was in the tree, not only decayed itself but also the timber that was next to it. The value of Dover Haven as a refuge had been demonstrated. One hundred ships and vessels had taken sanctuary in it, and had been preserved from the fierce storms as well as the enemy. It was pointed out that ships of 500 tons could be received and kept afloat, that it had become "water borne" instead of a dry port. The expenditure of 3,370*l.* to repair the damage done by the great storms was therefore implored.

Liverpool will shortly be celebrating its antiquity, and one feature will be a representation of Liverpool Castle. In 1707 the mayor, bailiffs and burgesses petitioned that two warrants granted by CHARLES II. for demolishing the castle should be acted on. Some persons had obtained a lease for fifty years of the old buildings. But they refused to comply with the conditions, and it was resolved to eject them. In 1649 an Act was passed that all the royal palaces should be sold. The palace of Richmond was one of them. After the Restoration it was reclaimed. In 1707 one of the buildings was occupied under lease by the Countess Dowager of WINCHILSEA. One ALEXANDER CUTTING, who had bought the adjoining property, was rendering the house useless and the Countess sought relief. The Lord High Treasurer had then more important business in hand, and her Ladyship was informed that the matter would have to be determined by law.

The union with Scotland imposed additional work on many English officials, but most of all on those connected with the Mint. Sir ISAAC NEWTON was then the master, and he was called upon to prepare reports and give instruction about dies and other things connected with the processes of coining. It seems remarkable that among the men consulted was the professor of astronomy at Oxford. The reports from Scotland revealed that the English civil officers were regarded as enemies of the inhabitants, and their lives were in danger.

One curious charge was made during the year in relation to the castle of Beaumaris. It was erected by EDWARD I. at the end of the thirteenth century. At the time of the Civil War it was held by the Royalists but had to surrender. Several members of the BULKELEY family acted as constables. A charge was raised by one of the officers of the Surveyor-General's Department that Lord BULKELEY, who then filled the office, had removed lead and timber as well as the best hewn stones from the castle and had used them in building of his own. It was stated that the house occupied by the local member of Parliament was erected from the materials, and there were several others constructed at a later time. Lord BULKELEY said his ancestors for hundreds of years had been constables of the castle, and as the fee they received was only 40 marks a year the keeping in repair of the castle was not contemplated. It was believed that after the Restoration all the castles in North Wales were ordered to be demolished. The castles of Flint, Conway, Carnarvon and others were also ruinous, and the materials had been converted

ivate uses. Lord BULKELEY declared that Beaumaris castle was never finished, and the only habitable apartment was completed at the expense of his great-grandfather, who for his loyalty was imprisoned in it. His lordship, however, admitted that he had employed some of the loose stones to finish a building. He also removed several tons of lead to prevent the castle from falling, but it was laid up in a cellar. The officials did not accept the defence; and the transaction shows that the eighteenth century ancient buildings, ecclesiastical as well as secular, required to be protected against their appointed protectors.

The War of Succession in Spain was sufficient to monopolise all the attention of Englishmen. It was in 1707 that Lord GALWAY, the British commander, lost 8,000 men and all his baggage and artillery at Almanza, and that event was sufficient to excite alarm. It was not to be expected that much attention would be given either to literature or art. Indeed, there were not many native artists at the time. VANBRUGH, FRANCIS BIRD, and JAMES THORNHILL, HENRY HOWARD and a few others exhausted the list. But enough was done, especially in architecture, to aid in the revival of the other arts, and it was WREN's desire to make St. Paul's representative of all the fine arts, and if he did not succeed the cause was to be found elsewhere.

THE OLD GOVERNMENT SCHOOL OF DESIGN.

By A STUDENT.

BEFORE making up my mind as to the propriety of publishing an account of two years passed in the drawing and painting classes at Somerset House, Strand, from 1850 to 1852, I felt doubtful whether a chronicle of the kind could be of much interest to the student of to-day. Although the school is occasionally referred to, yet the inner working is passed over, and a record of actual experience may therefore have a little interest for modern students.

The classes at Somerset House had not been in existence many years when, at the age of 14, began my artistic career as a student. My father doing business with many artists, from my infancy my surroundings were artistic. Some noticed and encouraged my puerile efforts, among them JOHN WYKEHAM ARCHER, F.S.A., and GEORGE LANCE, the Painter, his brother-in-law. Having watched my progress, they recommended me for a seat at the old school, which I took with mingled feelings of delight and doubt on May 16, 1850. My father said to me:—"You have now obtained what you desired, and will go on the right road, and must forget your early unmethodical ways."

At first I found copying various symmetrical curves springing from a central stem was not very exhilarating, but I persevered, and between the hours of 10 and 4 got through sufficient work of a commendable nature in the elementary class in three months to permit my passing up to the great room.

At this time the elementary class was held in a room on the ground floor west of the entrance from the Strand, and was conducted by WALTER R. DEVERELL, who was one of the pre-Raphaelites. The advanced classes were held on the top floor. The modelling-room, with casts from the antique, both figure and ornament, was conducted by Mr. TOWNSEND. The great room, which extended from the Strand to the courtyard, had previously held the Royal Academy's annual exhibitions, and a fine engraving exists showing Sir JOSHUA REYNOLDS conducting King GEORGE III. through the gallery, ear-trumpet in hand. The head-master, J. R. HERBERT, R.A., afterwards gave way to RICHARD BURCHETT, who held the position during the development of the schools up to his death. RICHARD REDGRAVE, R.A., also visited us. The other masters were Messrs. DENBY, RICHARDSON and HERMAN. The lecturer

was RALPH N. WORNUM, afterwards keeper of the National Gallery. The attendants were, curiously enough, all Scotsmen—COMYNS, IMRIE and MACDONALD. The rotund hall porter, BAUCUTT, with whom the students traded for paper, pencils, &c., was a well-known character, and very useful when drawing materials were suddenly called for. Those required by the senior students in the production of designs for manufacturers, &c., were provided by the Department, and supplied by ROBERSON, Long Acre.

Amongst the students, nearly all of whom I clearly remember, a few, naturally, take precedence for the work they performed then and afterwards. Although he was not a senior at the time, I mention the name of WYKE BAYLISS first, because he subsequently received the honour of knighthood. He was a prominent member of "our set," and could advance his opinions without fear. His personality was striking. On one occasion he told us he would draw a sphere in such a position that the outline should be an ellipse. Of course, we denied his assumption. To prove his words, he placed an ivory ball between the glazed window and protecting bars of the baize door at the top of the stairs, and standing on one side made the picture plane oblique instead of perpendicular to the line of sight, much to our amusement and a little disgust. It was a trick, of course. FREDERICK PEPYS COCKERELL was somewhat exclusive in his manner. His work was produced in the modelling-room, where I believe he made a special study of the casts from the antique it contained. To draw the human figure correctly should be the desire of the architectural student. No buildings of importance are complete without the aid of the sister art of sculpture, which should not be treated as a separate study; it should go hand-in-hand with architecture. The latter appears bald and incomplete without carved embellishment. Fancy the De Medici chapel denuded of its sculpture. At the present day we have a redundancy, but very often lacking purity of design or careful execution. The late Professor COCKERELL (FREDERICK's gifted father) was a master of sculptural design; the pediment of St. George's Hall, Liverpool, contains figures designed by him. That architecture is enhanced by judicious sculpture is well understood by our French neighbours.

A prominent designer at this time was C. P. SLOCOMBE, who had, amongst other work in hand, a piece of tapestry intended for presentation to Lord DUDLEY STUART, for his laudable services on behalf of the Poles. It was very elaborate, and so far as I can remember contained heraldic devices. Mr. SLOCOMBE was afterwards one of those who helped to revive the art of etching, and his plates are admirable. The next that recurs to my memory, CHRISTOPHER DRESSER, a hard-working energetic student, was clever in copying the plants, flowers, &c., that were sent from the Royal Botanic Gardens at Kew every Monday for our use. He made many studies in pencil or chalks on tinted paper. As Professor DRESSER's books on ornamentation are well known I will leave my pleasant friend for an architectural student, A. A. ALDERTON, who achieved success by his careful perspective drawing of a Greek temple, the Parthenon, I believe. Under Mr. RICHARDSON, the architectural master, and Mr. REDGRAVE, R.A., who assisted ALDERTON in the colouring, he turned out a fine drawing. A son of HENRY WEEKES, R.A., was with us. "FRED" WEEKES and PAUL JERRARD, son of the Strand printseller, were inseparable, but no remarkable work from them at this time occurs to me. There was, however, one student who came as a meteor amongst us and remained but a short time. His name was POWELL, and we heard he had studied at the Paris School of Fine Arts. His abilities were exceptionally good, and he was perfectly at home at figure-drawing. I remember him chiefly for the accurate portraits he took of his fellow students in spare time. I have mine by me now; it is exquisite for delicacy of touch and pure outline. I have also a head of a bearded man by him with turban highly

shaded that might be taken for work of an old master. Of his subsequent career I know nothing, but have heard that he was unfortunate and died young. There were very few branch schools at this time, and some of the students were trained for masterships of those which were to be opened. Among them, HODDER went to Edinburgh, ARMITAGE went to Islington, and "little" LOCKE sailed for Calcutta. The last was a great favourite with us. It was suggested that I should adopt teaching for my vocation, but as time went on a strong partiality for architecture led me to think it was my proper and natural bent.

I copied the best examples of PALLADIO and SCAMMOZZI with ancient Greek Doric that formed the school stock. My drawings were highly tinted, and I also made a perspective view of the Temple of Diana projected from geometrical drawings. But previous to joining Mr. RICHARDSON'S architectural class I had gone completely through the course of linear perspective under Mr. BURCHETT, and he gave me a task that had not been attempted before. There was a set of very fine plaster casts of the entablatures and capitals of the "Five Orders." I made measured drawings of that in the Corinthian style, from which was produced a perspective view. The cast was then hung up by a window overlooking the courtyard, receiving the south light. I shaded my outline in sepia, highly finished. This effort needed patience, but I was rewarded by obtaining the National Medal for it and the money prize in addition.

Reverting to my contemporaries, there were amongst us a few who were evidently possessed of independent means, and resorted to the school for recreation and to fill up time; but for the most part students came to work with a view to making art, in the form best suited to their several capacities, the means of livelihood in the future. Two were deaf mutes; one took up copying the painted ornamental pilasters at the Vatican, and produced excellent examples. A student named CUTHBERT was a proficient draughtsman, and one of those who afterwards assisted Professor SEMPER in designing the funeral carriage of the Duke of WELLINGTON when the school, under the new designation of "School of Practical Art," was being removed from Somerset House to Marlborough House.

The methods practised when I was a student may have since given way to a new order of things. I only speak of the system at the old school. Before doing so the saying attributed to MICHEL ANGELO, "Learn to sketch before you finish," is brought to my mind. It is my opinion that progress in drawing must necessarily vary with the temperament of the student, and that where one would sketch an idea at first another would wish to exercise painstaking care. TURNER in his early drawings was remarkable for his careful details, and evidently possessed that "infinite capacity for taking pains" which is a characteristic of men of genius. His later works were free from excess of minutiae, and broadly treated even to slovenliness, but the effect of greater detail was there. The writer thinks that this is the natural technical evolution, at any rate it was so with us, and the highest accuracy and neatness were required. Youth is the best time for carefulness, and painstaking methods bring success in their wake.

The day classes were open from 10 to 4, as previously stated, but a brief interval was allowed at midday for a "snack." In fine weather I with one or two others went for a ramble in the neighbourhood, combining recreation with a study of ancient buildings.

Keeping out of the Strand whilst munching our sandwich we explored the Temple with its early circular church and cross-legged knights, saw the grave of GOLDSMITH and Fountain Court, thinking of TOM PINCH and his sister RUTH, or sometimes looked into the veritable Roman bath with its vaulted roof and icy-cold water. Somerset House itself was carefully examined and the refinement of Sir WM. CHAMBERS'S detail admired. By-the-by, how sound the masonry

keeps; it is perhaps the best preserved in London. There was a legend with us that a workman fell from a scaffold at the south-west angle of the courtyard, and was saved from coming to the ground by his watch chain catching a timber, thus breaking the fall, and the watch dial was let into the joint of the rustication to record the event. I may be in error, but have the impression that the dial was there when I was a student, but on a subsequent visit I could not notice it.

On October 30, 1851, LOUIS KOSSUTH, the Hungarian patriot, was entertained at the Guildhall, and had to pass along the Strand on his way. To honour the eloquent man a flag was to be displayed from the middle window of our great painting-room, and the work of adjusting the flagstaff with pulley and line was completed about the time of the departure of the students homeward. But the spirit of fun entered into the brains of the more electrical of us, and a broom was attached to the cord and swung over the Strand, gently at first, and withdrawn into the room; but the bolder spirits of the school were not satisfied with this, so the household utensil was again exhibited to public gaze, but with an unpleasant result. Whether purposely or by accident, the line was allowed to slip and the broom was suspended over the heads of the people. The workmen were recalled, when the staff was taken down and readjusted, and the flag hung in time for KOSSUTH to pass beneath it. A great crowd had gathered and was much amused, some wanting to know if the national property was for sale. I did not actively participate in this frolic, but I saw it done.

As a Government institution, the school possessed certain privileges accorded us, and we were allowed to attend functions that were very agreeable. For instance, on July 2, 1850, we were present at the fête of Scottish Highland games held in Holland Park, Kensington, where I saw the Nepaulese Envoy resplendent with his jewelled costume. Again, I witnessed the funeral procession of the Duke of WELLINGTON on November 18, 1852, from the garden at Marlborough House, facing St. James's Park. At this period the school was about to take up its quarters in this historic mansion, and there I joined the class for building construction. But reference to these studies would not properly come under the head of this chronicle.

On July 16, 1852, HENRY COLE, afterwards K.C.B., or "FELIX SUMMERLY," as he was familiarly called, presented awards of merit to the successful students, on which occasion I received the National Medal for Linear Perspective, but the inscription upon it and the case in which it is enclosed reads, "School of Practical Art," the new designation for the old school, my *Alma Mater*. Three prizes for other subjects, value 3*l.* 10*s.*, were also awarded to me. Under date May 17, 1852, my journal relates that "The QUEEN visited Marlborough House in the morning privately to inspect the work of the students." Her late Majesty took interest in the progress of the school and encouraged us on more than one occasion.

I stop here. I regret if I should have failed to adequately interest the reader. On the other hand, I have derived pleasure by recalling some of my happier days.

OLD HALIFAX.*

THE general reader is not supposed to care much about the history of buildings, and accordingly in Mr. LING ROTH'S large volume the part on "The Yorkshire Coiners" comes foremost, and is most prominent in the title-page. To the student of social life it may appear strange that in the latter half of the eighteenth century the crime of coining prevailed in the

* *The Yorkshire Coiners, 1767-83: and Notes on Old and Prehistoric Halifax.* By H. Ling Roth, Hon. Curator, Bankfield Museum, Halifax. With numerous illustrations and chapters of "The Making of Halifax," by John Lister, M.A., and on "The Blackheath Prehistoric Circle," by J. L. Russell. (Halifax: F. King & Sons, Ltd.)

neighbourhood of Halifax; and for taking part in it several men were executed, while others were whipped. Enthusiasts of numismatics and archæologists would do well to remember that the practice was not confined to coins of the realm. In 1775 a chest containing nearly a hundredweight of Roman silver pieces was found in a field near Bingley. Pewter and copper vessels were stolen in order to imitate them. The first attempts were not successful, but counterfeits in block-tin and pewter which were made with care were accepted as genuine Roman coins.

The notes on Old Halifax are likely to possess much more interest for architects. The name remains a puzzle. According to CAMDEN it was derived from the possession of relics connected with the "Holy Face" and the "Holy Hair." But there is no acceptable record of any kind to support that theory. It is believed that "Feslei" in Domesday Book was the name of the district at the time of the Conquest. When the Survey was made there was no church at the place. It is supposed to have formed part of the lordship of Wakefield, which was granted by HENRY I. to Earl WARREN, and by the second Earl the church of Halifax—*Ecclesiam de Halifax cum suis pertinenciis*—was made over to the Cluniac priory of St. Pancras at Lewes, in Sussex. Although few traces of that church and convent remain, there is no doubt the priory was one of the greatest in England. It was claimed for

Halifax parish, largely assisted, doubtless, by the gifts of the monks, led to the rebuilding, or partial rebuilding, of the church in that geometrical order of architecture transitional between the Early English and the Decorated styles. Of this building, unhappily, but a fragment of its northern nave wall, and two double-light windows in that wall, one in a later wall, and the inner doorway of the north porch, remain. Nor are we able to determine with any certainty the dimensions of this thirteenth-century church.

Halifax possessed an agent of another kind that was supposed to deter men from evil ways. Writers about the guillotine trace its history as if it were an evolution of the Halifax "maiden" or gibbet. Whether the machine was introduced as part of the custom of "infangethief" or was a peculiarity of Halifax cannot be determined. The general belief is that it was introduced for the protection of woollen manufacturers against thievish workmen. TAYLOR, the water poet, says of it:—

At Halifax the law so sharp doth deal,
That whoso more than thirteen pence doth steal,
They have a gin, that wondrous quick and well
Sends thieves all headlong into heaven or hell.

Whether general or not, the gibbet was used in Halifax for a longer time than in other places. But it is remarkable that the rope was preferred elsewhere to the axe which was allowed to fall from a height.

THE MULCTURE HALL.

Drawn by H. R. Oddy.

GONDRADA, who had a share in the gift, that in introducing the Cluniac monks she was civilising the English church—*Intulit ecclesiis Anglorum balsama morum*—and Mr. LISTER considers it was an advantage to Halifax to be closely connected with the priory of Lewes. He says:—"For one thing it brought our forefathers into touch with the southern and at that time more progressive and cultured part of the kingdom, and the development of the resources of their estate in the north was a matter of material interest to its monastic lords." Mr. LISTER gives much interesting information about the history of the town in the thirteenth and fourteenth centuries. The Cluny monks appear for a time to have allowed the ecclesiastical control of Halifax to slip from their hands. But in 1256 a Papal Bull was issued empowering them to take possession of the church and its revenues. At the end of the thirteenth century Halifax shared in the great interest in religion which was a result of the preaching of the monks. Mr. LISTER says:—

At this golden age of art—about 1290, probably—the zeal of the first vicar and the liberality of the people of

As in other matters, it is difficult to determine when the woollen trade originated in Halifax. Although several trades are mentioned in a roll of 1307, there is no special entry which suggests cloth-working as the staple industry of the town, unless "JOHN the Weaver" exercised that trade. In 1314 there is, however, a record of a fulling mill and also of a corn mill, and we are told that "from those two water-mills have been evolved in course of centuries all the numerous factories which now represent the bulky volume of Halifax trade." It is commonly believed that EDWARD III. invited clothworkers from Flanders and that they were founders of the trade. But Mr. LISTER maintains that cloths were woven in the townships adjoining Halifax and were fulled and dyed before a Fleming was known in Yorkshire.

There is an interesting description from a conveyance executed in 1432 of a house in Shibden. In those days, when a Halifax builder was commissioned to erect a house he was instructed to erect one of six, eight or ten "crooks," and that simple method is supposed to have been the only specification in those confiding days.

The houses were framed, and the roof timbers rested on large oak uprights or bays, which from curving inwards at the top were called crooks. In the deed of 1432 the house is to be *de octo laquearibus contiguus*, a direction which the lawyer took care to make plainer by adding *Anglicè viij crukkes*. The house was to be covered *cum tegulis*, *Anglicè slatestones*. The tenant was to build the house at his own cost (with the exception of 26s. 8d. from landlord), within five months of the execution of the lease, and he was to "uphold with thake and mortar and leve hit tenauntabille on the end of his term."

An effort is made to describe the building operations as they would appear to an onlooker in 1432. In the next century it was evident that people were more difficult to please, and painted ornament and stained glass were utilised. It is also possible to describe with accuracy the furniture of the vicarage house in the time of HENRY VIII. The walls of the chambers, as well as the hall, which earlier used to be covered with rough panelling, were hung with "fine say," a species of worsted tapestry, and there were many goodly pictures in the rooms. The vicar possessed several pieces of plate. When the property was seized by HENRY's officials three or four horse-loads of books of Holy Scripture, divinity and law, with other faculties, were removed. They suggest that the clergy prior to the Reformation were not as ignorant as is sometimes represented. Some of the most interesting houses which were allowed to survive until modern times are described and illustrated. It is also possible from documents to recreate later buildings such as the manufacturers' hall. In the time of CHARLES there is reference to a "Woollen Hall" and a "Linnen Hall." But nothing is known about them. In 1774 it was decided to found a manufacturers' hall, and the circulars which were issued now appear rather amusing documents. Although the building was of importance no architect's name is mentioned in the announcements, but it is understood to be THOMAS BRADLEY, the engineer to the Calder and Hebble Navigation. The committee stated that it was proposed to lay the foundations and to raise the cellar storey between August and December 1774, and any mason or masons willing to engage in the whole or part of the work could learn how it was proposed to be executed by applying to the committee at the Talbot Inn. No arrangement apparently was made, for in the following December a manufacturer issued a warning to manufacturers and subscribers, in which he said that the approved (BRADLEY's) plan if put into execution would produce a building useful, elegant and plain, which might be finished with the money subscribed, "provided you employ no more of the gentlemen architects; if you do consider to employ them I fear too much of your subscriptions will be spent before you have adequate work done, and I may safely prophecy before the whole be completed you will have to subscribe afresh. The confusion and inconvenience that a circumstance of this sort would occasion is obvious to any man of common sense." The writer was afraid of the adoption of a plan for a circular building of which the defects were pointed out. The committee decided to erect a fourth part of the hall in April 1775, and invited tenders. Then in June the carpenters and joiners were invited, and on December 1 the building was ready for occupation. The total cost was 9,692*l.* os. 11½*d.* At the present time the hall is used as a wholesale fish and vegetable market, the 315 rooms serving as lumber-rooms and workshops.

Reproductions are given from BENNS's drawings of old buildings which existed up to 1856, which suggest that in the town and neighbourhood there were several interesting examples. The volume contains evidence concerning many events which happened in Halifax, as well as data which will suggest the ordinary life of the town. There are also chapters on prehistoric Halifax, and plates and illustrations are numerous. We expect that the volume will have the charm of novelty for the

majority of those who now live in Halifax, for there is no doubt the town has had its peculiarities. It will also be interesting to students of English life who live in other parts of the country. The authors have not in any way strained the evidence in order to make the record remarkable. There is an air of truth from the first to the last page, and although it may not serve for introducing picturesque descriptions the reader must feel that he is able to rely on all the statements.

THE LATE JOHN FINNIE.

THE death occurred on Wednesday in last week of the doyen of Liverpool painters. John Finnie was born in Aberdeen in 1829, and has been connected with Liverpool for half a century. Mr. E. Rimbault Dibdin has given the following appreciation of him in the *Liverpool Courier*:—"During a lifetime spent in association with artists, I have met among them many remarkable men, but no one quite comparable with John Finnie. Men of greater genius, larger achievement, handsomer, more witty, perhaps wiser—all these I have known; but not one who was all-round such a complete and satisfying personality. Nearest to him came the redoubtable Sam Bough, R.S.A., who resembled him in versatility, amplitude of resource, readiness of wit, and that indescribable quality which marks the distinguished personality. But Sam was rougher, more limited, more strictly a Bohemian. Finnie, if not by any means all things to all men—for he was himself always—was acceptable to all; a man who by his mere presence conveyed a sense of his superiority to the common men of humanity, yet elicited feelings of sympathy, camaraderie and affection."

Although Finnie was a Scotchman, his work was little known in the North, and I first encountered it when on a visit to Liverpool. Being taken by a native to the Autumn Exhibition (the last held in the Museum), I regarded the local efforts eagerly pointed out to me with the easy contempt for provincials natural to a youth from a minor metropolis until we came to a picture, "An Autumn Flood," signed "John Finnie." This arrested me. I was compelled to take it seriously. Soon after I entered on my apprenticeship as a Liverpoolian the name of John Finnie as president helped to attract me to the old Artists' Club in Bold Street. Having joined it, I soon met him, for he was no invisible president, but the magnetic central presence of the circle that met there for sociability and study. An intimacy soon sprang up between us, the remembrance of which is unclouded by a single unpleasant moment. We met at the club, at his house and studio, at the School of Art, at the periodical dinners of the "XX Club" and at the life class of the Liverpool Academy, where a playful leonine thump on the back occasionally accompanied his "Take your charcoal in your right hand," for his sense of fitness was outraged by my tendency to ambidexterity.

When he retired from the School of Art, Finnie broke up his home in Huskisson Street, and while retaining his Islington studio, removed himself and his activities to Tywyn, near Llandudno Junction, and set to work in most businesslike fashion to enjoy the artistic life untrammelled by any other work or care. He had a primitive but quite comfortable studio, he had several old comrades in art for company and his books and his violoncello for solace when tired for the moment of brush and scraper. I was only one of many who from time to time went to Tywyn almost solely for the pleasure of seeing his complete enjoyment of a busy idle life of basking in the sunshine of satisfaction which radiated from him. Never was a man more incapable of boredom, for everything and everybody interested him; he was never idle, and with books, music, talk, copper and canvas kept up a constant round of intellectual enjoyment. It was, indeed, a splendid spectacle to see him of an evening wielding a sturdy bow in a concert of strings at the house of Hague or Longshaw or some other friend, or doing his best with a flute to supply the place of a lacking violin. There might be something wanting in the perfection of ensemble, but his serene enjoyment was ample compensation.

Then his sky clouded. His devoted landlady and her husband died; he went out in a dreadful blizzard to attend the funeral of his friend John Ayling, and caught a chill, which resulted in a severe attack of influenza. He recovered, but his heart was affected, and his splendid

health seemed hopelessly broken. At last he decided to come back to Liverpool. Here his vigour gradually returned—at least in some measure—and we all hoped that he was in a fair way to enjoy that extension of life beyond the common measure which his exceptional physique seemed to promise. All went well until a few weeks ago when he had another attack of influenza. I last saw him at the opening of the Holman Hunt exhibition. He was with a favourite pupil, and seemed as full of interest in art as ever, but he was so manifestly ill that I went to his studio a few days after to inquire for him. But he had left it for ever.

It is not yet the time to attempt a definitive estimate of Finnie's place in art. When time and criticism have settled the question, it is probable that his reputation will stand even higher than it does at present, even though his great personality is now, alas! withdrawn. That he was a great teacher and the outstanding personality in Liverpool art for something like half a century is undeniable; only those with bad memories or short experience will measure his usefulness in this capacity by the last few years during which his scholastic vigour relaxed, or at any rate failed somewhat to keep pace with newer and more strenuous methods. As an artist he achieved less than was possible of him because of that divided allegiance which art never fails to punish. Yet unlike most teachers, he certainly reached greatness, and many of his works in oil and water-colour will take high rank among the achievements of the Liverpool school. Though he began as a painter of genre subjects, and attempted with success some figure-pictures in the pre-Raphaelite manner, his enduring fame will be as a landscapist of great versatility, whose work is marked by a fine sense of colour and design, and instinct always with a joyful perception of the beauty of the world. In his later years Finnie grew more and more fond of the practice of mezzotint, and a number of admirable plates produced by him will secure him a niche in the annals of engraving. It was a refreshing spectacle to see him seated before a copper-plate rocking or scraping with tireless industry and placing his toil with innumerable cigarettes. The contrast between the massive picturesque man and his cigarettes was almost as great as between him and his flute, yet somehow they harmonised. He had that way with him that made whatever he did seem absolutely right.

The long and useful life which Finnie enjoyed so thoroughly is at an end, and since it was for his happy nature as full of enjoyment as of work one should not too greatly regret the comparatively premature end. For his friends the loss is irreparable. Something has gone out of their lives the lack of which nothing can quite supply. But for him it is best that he has gone swiftly and unexpectedly while life was still a good thing, before the decaying powers of old age made it a burden. And over his grave might well be written the wise old adage, "To live well is to die happy."

EASEMENT OF LIGHT.

AN important article entitled "Notes on the Easement of Light in England and Elsewhere" has been contributed by Mr. H. A. de Colyar, K.C., to the "Journal of the Society of Comparative Legislation," published by John Murray. In the course of it the practice of ancient Roman as well as of modern courts in most parts of the world is described. The labour required for the compilation of a few pages must have been onerous, and several hundred cases are referred to. In describing the effect of the decision in *Colls v. Home and Colonial Stores, Ltd.*, Mr. de Colyar says:—

"That architects, builders and others should welcome such a decision is not surprising, especially in view of the fact that, owing to constant migrations from rural to urban districts, due to agricultural depression and other causes, the extension of existing towns and the creation of new ones must become more and more essential every year, in order to provide adequate shelter for the increasing urban population. Thanks to the decision above referred to, this work can now be accomplished with much greater freedom and infinitely less risk and anxiety than formerly—a condition of things which should ultimately lead to some improvement in the character of our buildings, and bring them by degrees more into conformity with recognised canons of art, both as regards construction and design. Architecture, which is said to be the most complex of the decorative arts, being now undoubtedly freed from harassing

restrictions of a legal character formerly believed (rightly or wrongly) to exist, may again flourish in our own land, as it did in ancient Greece, when buildings were erected which (sublime even as ruins) in their pristine state satisfied the highest standard of artistic excellence."

It is pointed out that "in the United States of America the easement of light which obtains in England is not generally recognised, being regarded as an anomaly in the law. It could not, it has been stated, be adopted in the growing cities and villages of the great Republic without working the most mischievous consequences. The enormous height of American buildings, which has caused them to be nicknamed 'sky-scrapers,' is evidently one consequence of there being no easement of light to check their upward growth. It is believed that not any of the States comprised by the United States of America have adopted the English easement of light. At all events, it does not prevail in the States of New York, Massachusetts, Maine, Connecticut, Pennsylvania, South Carolina, Alabama and Maryland, though its retention in Illinois, New Jersey and Louisiana has been asserted."

With regard to the extent of the easement of light and the 45 degs. test, Mr. De Colyar writes:—"In England the extent of the easement of light is the same, whether the right be acquired at common law or under the Prescription Act, as are also the conditions precedent necessary to constitute a cause of action for interference with such easement. For that Act has not altered the nature of the right or the principle on which it is to be determined whether the right has been infringed, but it has merely substituted a statutory title for the fiction of a lost grant or covenant not to obstruct. According to the recent decision of the House of Lords in *Colls v. Home and Colonial Stores, Ltd.* (where the ruling in the previous case of *City of London Brewery Company v. Tennant*, 1874, L.R. 9, Ch. 312, was approved of), the possessor of ancient lights is entitled to sufficient light, according to the ordinary notions of mankind, for the comfortable use and enjoyment of his house as a dwelling-house, if it is a dwelling-house, and for the beneficial use and occupation of the house if it is a warehouse, or shop or other place of business. There is, however, no proprietary right (as previously explained) to the light itself, in the owner of the dominant tenement, who has merely a right to resist the deprivation of light to such an extent as to amount to a nuisance; and in each case the question for determination is not whether since the alleged obstruction there is less light than there was before, but whether the light left is reasonably sufficient for the dominant owner's enjoyment, or, in other words, whether there has been such a diminution of light as to render the premises in respect of which it is claimed to a sensible degree less fit for the purposes of business or occupation. Moreover, even where a special light has been enjoyed for a special purpose for the period prescribed by the Prescription Act, no other right is gained than that of preventing the servient owner from building, so as to interfere with the light previously enjoyed, to the extent of causing a nuisance. And in the case of an implied grant of light, presumed by law to accompany under ordinary circumstances the lease or gift of a house, a grant of a special light is not readily implied, but only the enjoyment of so much light unobstructed as is reasonably necessary for the fair and comfortable use of the premises which are the subject of the grant. It was formerly considered that the existence of 45 degrees of light from the zenith was in itself a more or less conclusive test of the sufficiency of the amount of light. This notion seems to have arisen from a reference to a Metropolitan Building Act, which, however, was not intended to deal with questions of light, but to determine what was a reasonable width of street, having regard to the height of the houses on both sides and as regards air and everything else. It is now, however, settled that there is no law or inference of fact that the angle of 45 degs. is sufficient; though, on the other hand, it would seem that the fact that 45 degs. of sky are left unobstructed may, under ordinary circumstances, be considered *prima facie* evidence that there is not likely to be material injury, since experience shows that it is, generally speaking, a fair working rule to consider that no substantial injury has been done where an angle of 45 degs. remains, especially if there is also a good light from other directions."

It would be an advantage to architects if Mr. De Colyar's excellent essay were issued in a separate form, for it contains information of a kind that is not usually found in treatises on the subject.

NOTES AND COMMENTS.

THE judgment given in the First Division of the Scottish Court of Session is likely to surprise contractors for ironwork. The contract for the Glasgow Central Railway was taken by Messrs. BRAND & Co. They sublet a large portion of the ironwork to Messrs. GOODWINS, JARDINE & Co. It was expected that 12,650 cwt. of girderwork would be used in the low-level station beneath the central station. The sub-contract price was 13s. 3d. per cwt. Owing to alterations in the plans the weight was more than doubled, and amounted to 26,459 cwt. The sub-contractors claimed a higher price for the extra work, and the Court increased the price to 14s. per cwt. On appeal the First Division fixed the price for the whole of the work at what it was originally, or 13s. 3d. per cwt. The reason given was that the parties had tacitly agreed to accept schedule rates. As steel columns were not in the original contract, the price allowed was 20s. per cwt., with an allowance of 150% for the use of plant and labour. Another important point was that the weight as calculated from the drawings exceeded the actual weight supplied. The Court held that the calculated weight was contemplated when the contract was entered into and should be paid.

MOLIÈRE, like BOILEAU and several writers of the time of LOUIS XIV., resided at Auteuil, outside Paris. The house he occupied no longer exists. On the site of it and the garden was erected a large mansion known as the Hôtel Praslin. Near it was put up as a memorial of the dramatist a small structure called a temple. On the front was a bas-relief representing THALIA letting fall her mask and the inscription "Here stood the house of MOLIÈRE." The temple, like the original dwelling, is about to disappear. The hotel and gardens have been sold in lots. An effort was made by some admirers of MOLIÈRE to purchase the temple and to preserve it, for it contained not only his bust but a number of relics. The attempt was not successful, and it may therefore be assumed that on the ground where MOLIÈRE and his friends used to assemble a building consisting of numerous storeys will soon arise.

THE Dundee School Board have adopted the following resolution of the works committee:—"That the committee, while expressing satisfaction with the explanations given by the architect, recommend the board that for the future no schedule or specification be departed from after it has once been issued to contractors, whether the alteration proposed involves an addition or reduction in expenditure, unless the suggested change has received the sanction of the works committee, and excepting such alterations or omissions as may entail an expenditure not exceeding in the aggregate a sum equivalent to 5 per cent. on the total amount of any one contract which may be approved by the convener of the works committee." This remarkable effort owes its origin to a very simple occurrence. Mr. LANGLANDS, the architect, introduced radiators for heating of a more improved kind than was originally proposed. The additional outlay at the most will be not more than 42%, but for that sum there will be a larger area of heating surface and other advantages. Censors in Scottish towns appear to have eyes as microscopic as those of flies, and trifles assume astounding proportions, especially in works carried out by architects.

THERE are many able artists in France whose names are unknown in other countries. One of them was JUST BECQUET, the sculptor, who lately died in a Paris

hospital. He had attained his seventy-eighth year. He was born in Besançon, and early demonstrated his aptitude for art. He was sent to Paris, and there he was fortunate in being allowed to enter the atelier of FRANÇOIS RUDE, whose *Departure of the Conscripts* in the Arc de l'Etoile is probably the most popular example of the sculptor's art in France. If the gaining of medals was proof of ability JUST BECQUET could compete with any of his rivals. But he was not adapted for display, and the result was that he was little talked about, and, what was worse, did not receive the commissions for public work which he had the right to expect. In his leisure hours he devoted himself to music. He led a solitary life, and when his corpse was removed from the hospital there were only about a dozen friends who were present.

COMMITTEES and other men in the rare cases when it is contemplated to paint the walls of public buildings find a difficulty in the selection of subjects. Generally paintings which are suggestive of the past are preferred. It was supposed to be a concession to literature when a very small part of the Houses of Parliament was assigned to illustrations from English poets. It was therefore courageous on the part of Mr. G. BERNARD SHAW, when speaking at a prize distribution in Brighton on Wednesday, to advocate the displaying of events which might occur in modern days. He told the assembly that they could have pictures representing the lives of eminent citizens. One would show a citizen presenting the mayor with 20,000*l.* for a public object, and all around could be painted instances of what had been accomplished with the money. Another picture would deal with a gift of 50,000*l.* Instead of people grumbling at the rates, the men in Brighton would then be ashamed to pay only rates, and would be asking the mayor not to talk of shillings in the pound, but 500*l.* Even the poor might come along with their five shillings or five pounds, for these sort of things have happened in the history of the world. The spirit of voluntary giving, however, would never be aroused unless people were convinced that a great and popular use would be made of the money. It was pitiable to-day to see millionaires perplexed as to what to do with their wealth. Mr. CARNEGIE, for instance, had but one idea—free libraries. Are we so miserably poverty-stricken that the only thing we can think of is free libraries? Any really imaginative man walking round Brighton would be able to see ten dozen things badly needed which he might give money for.

ILLUSTRATIONS.

NEW SESSIONS HOUSE, OLD BAILEY, E.C.—DOME.

HOUSE AND STABLES, WESTCLIFF-ON-SEA.

THIS house has been erected on a commanding site facing the sea on the Esplanade, Westcliff-on-Sea, for Mr. CHAS. E. BELL. The exterior is built of red bricks with Bath stone dressings, a special feature having been made of the octagonal bay. Most of the work above first-floor level is treated with teak half-timberwork and stucco, and the roofs are covered with red tiles. The interior is finished in a modern style, with moulded ceilings and deep friezes; nearly all the doors were supplied by the Gilmour Door Company. The floors of hall, billiard and dining-rooms are of wood-block, and the interior painting finished with satinette enamel. The stables have been designed in a similar style to the house. Mr. A. J. ARNOLD, of Westcliff, was the contractor, and Messrs. CABUCHE & HAYWARD, M.M.S.A., of Westcliff, were the architects.

ROYAL NAVAL HOSPITAL, CHATHAM.

CATHEDRAL SERIES.—CARLISLE: SOUTH AISLE, LOOKING EAST.

THE CHEMISTRY OF WALL-PAINTING.

THE following evidence was given before the select committee of the House of Lords on the Palace of Westminster by Professor A. H. Church:—

Chairman (Lord Stanmore).

I think during the last ten years you have paid considerable attention to the state of the paintings and the stonework in these buildings?—Yes, for twelve years.

The results are embodied in reports which have been laid before Parliament from time to time?—Yes, there are now five reports.

These reports, of course, we may presume to contain your views upon the subject?—Yes.

But we should like to hear from you a little in detail what your advice would be to the committee or body whose duty it would be to provide for any pictures that were painted being first of all painted in such a manner as would not lead to their ultimate decay, and also as to any measures that would be necessary to insure their continued preservation?—I think I can give you in comparatively few words my matured opinion upon the subject after my experience of about twenty-six years, beginning with the Watts fresco in the great hall of Lincoln's Inn, which is the largest true fresco that has been painted, I believe, in this country, and which I tried to preserve twenty-six years ago. There are two points which have to be considered.

First of all, the ground on which a painting is executed, whatever the medium employed may be. Into the atmosphere of London there are now poured every year about a million tons of oil of vitriol, which turns the carbonate of lime in the stone and the plaster on which the painting is executed into gypsum gradually, with an expansion of about 10 per cent. in volume. The chemical change is accompanied by a mechanical expansion which causes a disruption of the ground and is the main cause of the destruction of the paintings in whatever medium they are executed, and even of mosaics in some cases, upon a ground prepared with lime and sand. The lime is the point of weakness. If you had plaster of Paris to begin with, then there is no action of the atmosphere and no destruction—it has already been altered, as it were, into the substance which the carbonate of lime or lime passes into. Therefore it seems very important as regards stonework, the ground on which the paintings or artistic works of any kind are painted or affixed, that we should not lose sight of the fact that the carbonate of lime is not an ingredient which ought to enter into the grounds. I see this sulphuric acid destroying all the architecture in London, both old and new, and it seems to me that this sulphuric acid has an enormously dangerous action. Sir Lawrence Alma-Tadema just now was talking about tapestry, for instance. That is a lovely material, though you may not have there expressed the direct thought of the artist. But tapestry becomes frightfully injured in the London atmosphere. It is a very absorbent material, and it absorbs sulphuric acid from the air. It takes up 10 per cent. of moisture, and it becomes sourer and sourer in the course of years, and the inevitable result is that, besides the injury to some of the colours and dyes, there is decay of the fibre: it becomes quite brittle. In fact, if you put your hand in a woollen curtain in a London house that has been up for two or three years you will notice there is a peculiar stickiness about it, and if you analyse that curtain you find sulphuric acid in a considerable quantity, and that destroys the fibre. Therefore, though I am sorry to express the opinion, I do feel that unless tapestry were in some way protected from the sulphuric acid—waterproofed, or I may say acid-proofed—I do not think it could be safely used in Westminster.

How do you account for the fact that the old tapestry in the House of Lords, which was destroyed in the fire of 1548, had been up there for between 200 and 300 years?—I think the difference is mainly due to the increased consumption of coal in later years. This calculation which I have mentioned, which is not my own, of one million tons of sulphuric acid poured into the air from the annual consumption of coal in London is a very serious matter, and although a good deal of it goes on to the ground, and a good deal is neutralised by the marble and stone of the buildings, yet a great deal must get into the houses and into large places with many open spaces such as the Palace of Westminster.

I think I interrupted you in the middle of your observations—have you anything to add on the point you were dealing with?—I think I have dealt with the question of sulphuric acid.

Earl of Carlisle.

I do not know whether you are intending to revert to the point again or not, but perhaps I may ask you this question:—From what you said about the chemical change of the surface of the wall, I gather that you would consider that the frescoes that were painted here would have been damaged whatever the preparation had been. Different explanations have been given for these frescoes having perished. It has been attributed sometimes to the sand that was used, and sometimes to the dampness of the walls, but I gather that you consider that the chemical change in the surface would be sufficient to damage the frescoes, however excellent the preparation had been?—A fresco is, of course, a very delicate structure. The colour, the pigment, is held on by a film of carbonate of lime, and that is in the course of a few weeks turned into sulphate of lime, and has no longer binding power, and it begins to perish.

Earl of Plymouth.

Arising out of that, may I ask you this question, Would you recommend that the walls, if it was intended to apply fresco in some form to them, should be prepared with plaster of Paris, instead of the ordinary plaster?—I should, instead of with the ordinary lime-sand plaster.

Earl of Lytton.

Do you think that if that were done the paintings upon them would be much more durable?—I think they would, but it must be remembered that the paintings must be kept dry; they must never be allowed to have moisture running down them, as sometimes has happened in the Palace.

Chairman.

When you speak of moisture, moisture from what cause do you mean?—Moisture from the condensation of damp-laden air upon the corridor walls. When the temperature, for instance, of the Royal gallery has not been kept up, and in winter time the air has suddenly become moist, as to-day, for instance, laden with moisture from the south-west, then the water runs down, and it is quite acid to the taste.

Having a plaster of Paris background would be no protection for that, would it?—It would be a protection against the acid, but not against the water, because plaster of Paris is slightly soluble in water, while lime plaster would not be in pure water.

Then the damp would injure it even more in the case of a plaster of Paris wall?—Yes.

Earl of Carlisle.

You could not have a fresco proper upon plaster of Paris, could you?—No, it is incompatible with that medium.

Painting on a plaster wall would be simply a tempera painting?—Tempera painting, or oil-painting or spirit fresco, as it is called, but not true fresco.

Earl of Plymouth.

If the walls were prepared with plaster of Paris, in that case would there be any distinct advantage in having a foundation of canvas upon which the painting was made and then applied to the wall?—I think there would.

I ask because, as you could not get a true fresco, as Lord Carlisle has pointed out, it removes any objection to painting on the canvas surface with spirit medium or anything of that kind?—Yes, it does. I feel strongly that the spirit-fresco medium should be executed not on the wall itself but on canvas, and should be *marouflé* to the wall afterwards.

Earl of Lytton.

I understand you to hold that whether that is done or the painting is on the surface itself, the preparation of the wall in the first instance is absolutely necessary?—I am not sure that I follow what your Lordship means by the preparation of the ground.

The plaster of Paris surface that you suggested?—Yes, I think it would be better to use plaster of Paris, because then you run no risk of any attacks from the back. You protect the front by the white lead mixture put under the canvas when you fasten the finished picture to the plaster, but you cannot be sure of the back, and both moisture and corrosive gases get in at the back unless you have slate, as they have at the Royal Exchange.

Earl of Carlisle.

Are you satisfied with the course adopted by the Royal Exchange as perfectly satisfactory?—I am on the whole very much pleased with it. The tilting forward of the slate ground an inch or two is a very good thing also; it prevents dust from lodging on the picture.

Earl of Plymouth.

And it is not apparent to the eye?—No, it is neutralised by the perspective effect.

Earl of Carlisle.

In Mr. Hamilton Jackson's book it is stated that in England walls which were to have figure subjects painted on them appear often to have been prepared with cloth glued over the surface in the fourteenth century?—In panels and cabinet pictures of the thirteenth and fourteenth centuries it was almost invariable to have canvas glued on to the panel, and where the panel has perished from the attacks of insects and mildew, and the picture has often been perfectly preserved, the saving clause has been the canvas.

So that practically this expedient is merely returning to an old practice?—It is merely returning to an old practice, only with something better than the practice used in the old days.

Chairman.

I think we have rather interrupted the course of your observations; would you continue what you were saying?—Having disposed of this dangerous enemy, sulphuric acid, what I was going to say was that then you have to select a method of painting or of decoration, whatever kind it may be; and mosaic is of course the most impenetrable and unalterable of all kinds, only there the question of the cement in which the glass, porcelain or pottery tesserae are laid is a matter of great importance. I have seen mosaics in which the lime cement in which it is laid has effloresced and exuded between two neighbouring tesserae. I only mention that because it is obviously necessary in an atmosphere like this to get a substance that is not altered by the corrosive atmosphere of London.

Such substances are to be found, I presume?—Such substances are to be got, or you can protect by a material which shall render absolutely waterproof the joints between the small squares.

Earl of Carlisle.

You heard Sir Lawrence Alma-Tadema mention the subject of plaster reliefs—bas-reliefs?—Yes, in gesso.

Have you anything to tell us about that?—I thought it was a very admirable idea, for gesso will stand. It is generally made largely of plaster of Paris and hardened by a mixture of other substances, and when it is painted—and I presume it would be painted in some way or other, or tinted—it is then practically unalterable.

Chairman.

You have not said anything as regards one very important point with regard to the preparation of pictures, and that is the pigments employed. We had the point strongly impressed upon us the other day by Sir Edward Poynter. He pointed out that all the earlier frescoes had been painted in terre-verte?—Yes, terre-verte and yellow ochre were two things largely used which were fatal to frescoes. We have had a case in the King's Robing-room in one of the panels there; one of the figures has got a large quantity of terre-verte in it, and that part of it gave us more trouble than any other picture in that room.

Earl of Carlisle.

That was one of Dyce's frescoes?—Yes, it is the one in the south-west corner of the room near the window. There is green terre-verte in the sandals of the knight in that small panel. Whatever may be the medium employed I have no doubt whatever that the best thing is a modification of the Gambier Parry spirit fresco.

That is practically what is used at the Royal Exchange?—Yes. The modification which is introduced, although the artists themselves do not quite like it, because it is not quite so easy to work, is to substitute for beeswax (which is not an absolutely imperishable material, and which gives a flatted or mat effect) a hard paraffin wax.

Mr. Abbey told us he made use of it for his paintings at Boston?—Yes; this is the stuff which I employ (*producing a specimen*); it is made from earth wax and has a high melting point; it feels exactly like a bit of wax when it is warmed.

How is it dissolved?—It never does dissolve; it is simply used to make a flat surface by being mixed with a liquid. You melt it with copal varnish and spike oil, or oil of turpentine, and then it solidifies into a sort of ointment, but it consists of minute particles diffused throughout the whole which gives a mat or dead effect.

Is that practically the same method as that which is employed by M. Puvis de Chavannes?—That I cannot say,

because I never could find out exactly what it was he did use, though I have examined some of his large wall-paintings in the library and museum at Amiens. I could not find out exactly, but I do not think it is. I should think this substance which is called ceresin has a melting point of 150 or 160 Fahrenheit; it is a very useful material to protect a finished painting in whatever material it may be executed other than water-colour; taking a fresco, for instance, it is a very useful material to strengthen the plaster which has been sulphated and disintegrated by the action of sulphuric acid. That has been done in the King's Robing-room, where the ground had perished and could be moved with the finger; that has had to be treated with what I may call ointment of ceresin, because you cannot dissolve ceresin freely enough; you cannot get a strong enough solution, but you can make a paste with a hydrocarbon called toluol, with about ten parts of that and two of ceresin and half a part of spirit of turpentine. You make an ointment and you put it on with a brush or palette knife and leave it for a day, and then the next day fire it in and heat it with an electric or other heater and drive it into the wall, and then nothing will alter it. That is the way those frescoes and other pictures are now being treated; they are being waterproofed.

Do you know Mr. Draper's work at the Drapers' Hall?—I have not seen it yet.

You do not know exactly what it is. He spoke of paraffin wax, I think?—I should think it would be ordinary paraffin wax, which is rather crystalline and granular and does not act so well as ceresin. It is chemically closely allied to it.

Earl of Plymouth.

This process does not affect the colours, does it?—It does not affect the general tone of the colours. It slightly darkens some and slightly lightens others, but the general result is very slight, and it may be used on decaying stone as well. I might just mention that part of the Mercers' Hall, Cheapside, has been treated with baryta water according to the method adopted at Westminster in the chapter-house, and if you look at it (and it is worth looking at now before the winter comes on) you will see that the three bays near the City which have been treated afterwards with this ointment of ceresin look like marble. The two that have been treated only with baryta water look like fresh Bath stone or Caen stone; they look very nice, but the others have a slight translucency, and I cannot help thinking that in the treatment and cleaning of the stone in the various lobbies of the Palace here that ceresin treatment might well be adopted.

Chairman.

Are you being consulted with regard to the cleaning of the stone that is now going on?—No, I have not been.

Earl of Carlisle.

I gather from your evidence that if you were deciding yourself how these spaces should be decorated you would recommend that the work should be done in spirit fresco in the same manner as has been adopted in the Royal Exchange?—Yes.

Supposing any suggestion of that kind were made, have no doubt some portion of your evidence would be quoted as indicating that any wall-paintings that were put up here would be liable to be deteriorated or destroyed. Could you in a few words tell us whether you think, if the wall-painting was done in the manner you have described it would be tolerably safe?—I think it would be perfectly safe, but the surface would require to be cleansed from time to time from deposits of soot and dust, cobwebs and acids.

How would it be cleaned?—By ordinary distilled water and bread and other very simple processes which have been described in the four Parliamentary papers on the subject.

Earl of Lytton.

It could be done without injury to the painting?—Yes, without any injury to the painting, but you cannot do without any injury on true fresco or on an ordinary oil painting, or on a painting executed in distemper, or even on a stereo-chrome. Apart from the great difficulty of acquiring proper technique in stereo-chrome work there the difficulty of the abraded surface and the changes which occur owing to the action of the sulphuric acid of the air. There are two changes which occur owing to the action of the sulphuric acid in the air, which are both most injurious to stereo-chromes.

Earl of Carlisle.

And to ordinary tempera?—Yes, in a measure.

Chairman.

Sir William Richmond was telling us the other day that was at present executing a wall-painting in tempera and had a wine medium?—Was that in London?
In London. You would be of opinion that that was less nable than spirit fresco?—I think it would be less clean- than spirit fresco. I may mention that I have just ored a fresco-painting done by Sir Edward Poynter when was an Associate of the Royal Academy about thirty s ago, in St. Stephen's Church at Dulwich, a picture of Martyrdom of St. Stephen (vide *Architect*, March 17,), a very interesting early work of the President. That a pure fresco. I have now coated it with ceresin after ng got the actual injuries restored. The whole of it covered with a film of sulphate of lime. The sulphuric of the atmosphere of Sydenham Hill had attacked the of carbonate of lime which protected it. One had to id of the obscuring film of sulphate of lime by means ater and spirit of wine and bread, and then touch up defective parts, and then the whole of it has been coated a what I called ceresin ointment, and that has been l in.

Earl of Carlisle.

The two panels painted by Lord Leighton at South ington were painted in this spirit fresco material, I ve?—They were.
On the wall?—On the wall.
The wall there is rather rough, is it not?—In the case ne of them, the northern lunette is on very rough ter.
That, of course, makes it more difficult to clean?—That e of the difficulties, the sand grains drop off.
That difficulty does not occur in the plan you have n describing of canvas applied to the wall?—It does not.
Can you tell me whether Lord Leighton's fresco at dhurst (vide *Architect*, April 29, 1871) is painted in that erial?—Yes. It is the earliest one done by him in that erial. I have seen it and it is in very fair condition. Only part damaged is where the moisture has got in at ase of the wall, and there the film of pigment has ed off in places.

Chairman.

Your opinion of the water glass process, I think, is ex- sed in some of these reports of yours, which have been e before Parliament, but I think we should like to hear it you have to say upon that subject?—If the artist can with it, and his materials are good, it is the next best ess to the spirit fresco, and it has the advantage, of se, of being painted in the light in which the picture is e seen, and under the circumstances which will prevail e future. But it has that drawback, that you must a plaster that is somewhat rough, and in consequence es not admit of being cleaned at all easily. Those two res in the Royal Gallery have been very troublesome ; e are millions of white spots in them, where the grains and have come off from the ground or have become d because of the action of sulphuric acid upon the lime h surrounds the little grains of sand. Therefore, as it t be painted to work up on a lime plaster ground and upon a gypsum or plaster of Paris ground, I fear that in ion, where sulphuric acid is present in such immense atities, it is not an available process.
Now I should like to come to one or two practical tions—I mean in the sense of being of immediate ern—in regard to this building. I know you have e a careful examination of those ruined panels in the per Lobby?—Yes.

Even out of those have perished?—They have.
The eighth is in perfect preservation?—Yes.
So what causes do you attribute the preservation of that l? I presume it was subjected to exactly the same spheric influences as the others, and it may be pre- ed to have had the same wall conditions behind it— at do you attribute its complete preservation as com- d with the others?—I am bound to say I am unable to ain it. It is the work of Sir John Tenniel. It is the e one which is perfectly preserved. It is painted t excessive thinness; all the pigments are laid on most ately. I can only imagine that Tenniel may have oyed some other medium also. He painted it in e, it is supposed on the fresco lime basis, and ay have introduced some material which has pro- ed it, such as white of egg, or some albuminous me other preservative material, because, as we e it is utterly different from all the others. I y coated it with paraffin wax, so it has not suffered since

it was treated. I may say it was beginning to go at that time; it had to be touched up in twenty or thirty different places where the colours had flaked off, but the ground was much less absorbent there; it was very different to the touch. There was a difference, but what it was one could not tell. One cannot take down a picture like that and analyse it; you can only examine it *in situ* by the ordinary tests. There must have been something that has not been revealed.

It is very curious?—It is a most curious phenomenon.

Then with regard to the others, six out of the seven are absolutely destroyed?—Yes.

Herbert's picture of "Cordelia" is not so completely destroyed as the others; do you think that is injured beyond the possibility of repair?—No; I thought that an artist who sympathised with his style might be able to renew it.

I am very glad to hear that is your view, because I understood you had expressed a contrary opinion?—Of course, I was very much shocked at its appearance; I felt it was beyond my powers. It is not a matter for a chemist.

It is a matter for a painter and not for a chemist, I take it?—Yes.

But you would not say that the whole of what remains must go?—No, I think not. I ought to have said, perhaps, that Herbert's picture of "Moses bringing down the Tables of the Law" is a most splendid example of stereo-chrome in an almost perfect condition in the peers' robing-room.

You mean the large one in the standing committee-room, that is stereo-chrome?—The very inferior one on your right as you enter is an oil painting on canvas, but the one facing you is stereo-chrome. I have cleaned it.

Earl of Plymouth.

What is the other name for stereo-chrome?—Water glass.

Chairman.

In regard to the picture of "Cordelia and King Lear," have you noticed anything peculiar about the robe of Cordelia?—I am afraid it is a long while since I have seen it.

It is rather curious. The blue of the robe is apparently in perfect preservation, but the ornamentation of the robe—the edging of it—has all perished?—I suppose the robe was painted in an artificial ultramarine.

Earl of Carlisle.

Do you know whether the pictures in the House of Lords itself were replaced by oil ones?—They are all frescoes—all six of them; there are three over the throne and three over the gallery.

I understood they were originally?—They still remain so. In one of these Parliamentary papers there is an account of my last cleaning of them; they sadly want cleaning again.

Chairman.

Then the only frescoes that have absolutely disappeared are the ones in the octagon upstairs?—Yes, in the upper waiting hall. I see the question of the cleaning of these frescoes is referred to in this Parliamentary paper, memorandum 5. They were treated eleven years ago.

Can you say how often the necessity for treating them would recur?—I think the treatment with ceresin, or other material, ought to be renewed every three or four years.

So frequently as that?—I am afraid it ought to be on frescoes, but on water-glass pictures much less frequently.

The pictures in the House of Lords, I understand, have not been renewed for eleven years?—Eleven years.

Earl of Lytton.

Is it an expensive process?—No, it is only the labour; the material is nothing. For instance, I think a sum of 100*l.* or rather less was expended last year upon the five large frescoes in the King's Robing-room.

Only 100*l.*?—Yes.

Earl of Carlisle.

Do you think that the Royal Exchange pictures require the same amount of renewing?—They are practically cleaned every year, I believe.

Chairman.

I think the earliest of those Royal Exchange pictures was painted about seven years ago, was it not?—I think it would be more than that.

I thought the date would be about 1899?—I think Lord Leighton's picture was painted before that.

I put the question with a view to asking as to whether

any deterioration had been visible since they were done?—I think that one is in a wonderfully perfect condition.

Is there any other matter you would like to add to what you have said, in the way of giving us warning or advice?—Nothing occurs to me at the moment, but no doubt a number of things may occur to me when I have left the room. If I think of anything might I send you a memorandum upon the subject?

We shall be only too glad to receive it.—Thank you.

Earl of Lytton.

To go back for a moment to the action of the atmosphere upon tapestry, I understand you to deprecate the use of tapestry owing to the action of the atmosphere upon it, but do you know of any process by which tapestry can be prepared against the action of the atmosphere; it seemed to me you rather suggested that?—I cannot help thinking that something might be done to prevent the wool and jute or hemp web from absorbing the acid vapours of the atmosphere.

You spoke about making it waterproof, were you thinking of any particular process?—I have thought of, and I have indeed tried upon fabrics several methods, but they all have to be done after the material is completed; it is not possible to work the wool, or the warp and the woof, with a prepared waterproofed wool and hemp or other fibre.

Earl of Carlisle.

Would not the surface, however you treated it, necessarily collect a great deal of dirt?—Yes.

Chairman.

Cannot that be cleaned off?—It is very difficult to get it off, the surface is so well adapted not only to absorb vapours, but to collect dirt and dust and soot.

I do not know whether there is any good specimen of tapestry in London itself now; but in the neighbourhood of London, for instance at Osterley, there is a great deal of very beautiful tapestry, and some of it is in very good condition?—One can, of course, study the tapestries in South Kensington Museum; those are nearly all under glass now. Those who have charge of them would know how far the ground was deteriorating.

Of course, the sulphur in the London atmosphere is a thing by itself?—It is quite by itself.

But when they are free from that the tapestries seem to last a long time?—I do not think a small amount of it, such as you get in the country or even in places in the suburbs, would be very serious; but in the heart of London, or in the heart of Westminster, we have to think about it and protect ourselves against it.

But the old tapestries of St. Paul's Cathedral have been for the last 350 years in the palace of the Archbishop, and they look as fresh as they were when they were first made?—The increased consumption of coal of late years in London no doubt makes a difference.

Earl of Plymouth.

As regards the question of glazing, you are well acquainted with the frescoes in the corridors to the House of Commons and the House of Lords?—Yes.

I should like to ask you what is the condition of those frescoes, and what was it before and since they were glazed?—I think there are sixteen of them, eight in each corridor, and seven of them have during the present year had their glasses removed, and they have been cleaned with bread and distilled water and spirits of wine, and the weak places in the grounds have been treated with ceresin wax. There were a few weak places, and there were a few bare spots; those have all been got rid of. I believe it will be generally found that they are now in a wonderfully perfect condition. The cleaning work consisted of the removal of a film of sulphate of lime in parts and one of silica, or flint, which had come out in the deepest colours of the folds, and made them actually lighter than the high lights. That has been done in the case of seven of them; that has been put all right. I was not acquainted with them before they were glazed.

Chairman.

Do you remember when they were glazed?—No, I do not; it was before I was asked to give my help in the matter of these pictures.

However, you are of opinion, I understand, that if the pictures were executed in the same manner as in the Royal Exchange, they could be reasonably preserved without glazing?—I think so; I think every one of those sixteen pictures in the corridors might safely have the glass taken off and be treated in the same way that the seven have been

treated this summer; that is, with a film of ceresin. I not present myself, unfortunately, owing to absence from England, during the operations, but I have watched the pictures for years, and I gave written instructions as to how they were to be treated.

We are very much obliged to you for your interest and evidence; have you anything further to add?—I think not.

HOLYROOD CHAPEL.

THE opinion of Mr. J. Crabb Watt, K.C., has been sought with reference to the bequest of the Earl of Leven and Melville for the repair and restoration of the chapel at Holyrood House. The following questions were put to him:—

1. Is the bequest valid or invalid in itself?
2. Does the clause delegate the decision to execute will on the trustees, and does the refusal of the trustees to execute nullify the bequest?
3. What steps can a beneficiary take to enforce payment or performance?

Mr. Crabb Watt considers the bequest in some respects unique, and the construction of the word "condition" occurring in it was not free from difficulty; but after lengthy examination of the authorities and text writers is of opinion that the bequest was valid and could not be nullified by the refusal of the persons he called for convenience subsidiary trustees—viz. Sir John Stirling-Maxwell and Lord Balcarres—to accept the subsidiary trust, and execution of the will could be enforced by a beneficiary. In this case the subject (40,000*l.*) and the object, "in putting into repair and restoring the chapel at Holyrood Palace," that it can be used as a chapel for the Order of the Thistle, were quite clear. The bequest was thus complete. The only condition mentioned in this part of the clause was obtaining permission of the King to the projected work. That was not so much a condition precedent as a statutory fact, because it was obvious that if the solum and fund of Holyrood Chapel were vested in His Majesty, he could do any other private owner might if he chose block the repair or restoration of his own property by another. If the fabric was vested in the Crown, the same principles applied. Further, the motives disclosed in the will were legitimate and praiseworthy. Apart from the public spirit evidenced in the bequest, the intention capable of being carried out without injury to any public or private interest was to provide a chapel for an Order of Knighthood and a memorial to the restorer.

It ought also to be observed that the bequest was for an object, which was to be accomplished by what at first sight appeared to be two processes, namely, repair and restoration. The testator appeared to have had in view that some parts of the structure, if not all of it, like many similar structures, were dilapidated beyond repair, and in places or parts of the fabric where such a state of dilapidation existed, he supplemented "repair" by "restoration." Of course, restoration frequently meant rebuilding, and the testator had that possibility in view *co nomine*. There was while the gift was limited in amount, it could not, in counsel's opinion, be maintained that it was void on the ground of insufficiency for complete repair and restoration. These were really synonymous terms in the sense that restoration was complete repair; but mere inadequacy of amount, even if the inadequacy were proved, which it was not, would not, in counsel's opinion, lead to total forfeiture of the gift. This would be making an unproved hypothesis frustrate a clearly-expressed intention and object. There seemed to be three classes of duties which the testator had made up his mind about—the financial administration, the design or plans for the restoration, and the carrying out of the work according to these plans. The first was committed to his trustees, the second to Mr. Ross, and the execution of the work was committed to Mr. Ross and the two friends named, with Mr. Ross acting as architect. It seemed, in short, to have been the belief, as well as the intention of the testator that he had arranged for everything necessary for the carrying out of his wish, even to the provision of two friends to act as unpaid clerks of the works. The testator thus, as it seemed to counsel, created a subsidiary trust within the principal trust, and the order in which the testator's intentions should have been carried out was, first, for the principal trustees to apply for the permission of the King, and having secured this, then to set out carrying out the testator's intention *quoad ultra*. The King might have refused his sanction, and in that event the question could have arisen. But the proper and the

gal order of proceeding had, in counsel's opinion, been inverted. Counsel thought the action of the trustees had been not merely unusual, but amounted to a breach of the trust committed to them. The principal trustees did not comply with the clear direction of the testator to obtain permission of the King. Counsel thought they were bound to explain why they did not do so, or whether they abstained from doing so from some collateral and therefore illegitimate purpose. Again, if the principal trustees directed the subsidiary trustees to consider the question of the possibility or feasibility of repair and restoration they exceeded their powers. The testator, in his opinion, obviously had made up his own mind on this question. Apart from which consideration it was manifest that repair and restoration were not in the region of impossibility at all. They were in the region of cost only, and it was not in the discretion of the trustees, principal or subsidiary, to determine that merely because 40,000*l.* might be sufficient for complete restoration they were to abstain from carrying out the intention of the testator to any extent. Counsel did not suggest that if it were impossible (in the sense of an object being absurd or of something being attempted against natural law) it would not be the duty of the trustees to stay their hand, and perhaps to obtain the authority of the Court for abstaining from carrying out the bequest. But such was not the state of the facts in this case.

The trustees' action in ignoring Mr. Ross must be imputed to this, that they entertained views adverse to the conviction as regards feasibility on which the testator himself acted in making the bequest, a conviction which they so knew was shared by Mr. Ross. Counsel also maintained that the trustees had acted *ultra vires* in taking the opinion of strangers upon a question which the testator never committed to them—that was, whether Holyrood Chapel could be repaired and restored. It was a breach of trust to ignore the direction of the testator with regard to Mr. Ross. It was elementary law that where the estate of a deceased person had legally vested in trustees for an object named by a testator, any beneficiary had a *jus crediti* which he could vindicate by action, and here the beneficiaries' vindicating action might be the Order of the Thistle, or any member thereof, or Mr. Thomas Ross, although in regard to Mr. Ross a question might arise whether he had title and interest to sue. The only serious question to be considered was, Did the testator delegate any power or discretion to third parties enabling them to defeat his purpose and subvert his bequest? Having quoted the authorities on this subject of *delectus personarum*, counsel did not think it could be suggested by anyone that the testator here meant this legacy to go into intestacy. Nor did he give it to the trustees to be spent at their discretion. Nor did he say that the execution of the work was to be at their discretion, but depended on their consent. On the whole matter counsel's opinion was that this clause was a valid bequest for the purpose clearly named, and that the duty of the principal trustees was to apply for the permission of the King, and (said consent having been obtained) then to proceed to the execution of the work, requesting the subsidiary trustees, including Mr. Ross, to see to the execution of the work according to Mr. Ross's plan. If the subsidiary trustees declined to see to the execution of the work the Court might be applied to for authority to dispense with their supervision, and the questions discussed, in counsel's opinion, would then come up for decision. Or, if the trustees simply sat still and did nothing, an action of declarator containing other appropriate conclusions might be raised against them. Or the legatees and the trustees might agree upon the essential facts and submit a case for the opinion of the Court. But, in any case, although the legal questions might not be free from doubt, and whatever views might be entertained of the propriety or otherwise of the restoration proposed, it seemed to him quite clear that the munificence and the object of the gift were too great to allow of their being frustrated through an assumed power to forfeit on the part of the subsidiary trustees.

At a Meeting of the Worcester City Council on Tuesday a recommendation by the property committee to appoint A. G. Parker, son of Councilor A. H. Parker, as city architect, in succession to the late Mr. Henry Rowe, caused a strong protest from the minority. An amendment to refer the matter back was defeated by twenty-five votes to seven, and the recommendation was agreed to.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A SPECIAL general meeting was held on Monday, when seventeen Fellows and forty-nine Associates were elected, viz. :—

Fellows.—T. Ballantine, W. R. Butler (Melbourne), A. L. Campbell (Edinburgh), F. W. Chancellor, F. W. Deas, M.A. (Edinburgh), W. E. Hazell, J. R. McMillan (Aberdeen), P. W. Meredith, S. V. North, H. D. Pearson, J. Sansom (Liskeard), J. N. Scott (Edinburgh), E. Summerhayes (Perth, West Australia), J. R. Sutton (Buenos Aires), A. Thornley (Liverpool), T. F. Tickner (Coventry), G. Watt (Aberdeen).

Associates.—A. J. T. Abel, W. T. Armstrong (Lancaster), T. S. Attlee, G. S. H. Bradford (Cape Town), E. B. Crossley (Nottingham), T. L. Dale, H. A. Dalrymple (Grays), N. J. Dawson (Chelmsford), A. C. Denny (Dumbarton), C. M. Drewitt (Southport), P. M. Fraser, J. T. Halliday (Stockport), J. H. Hargreaves (St. Anne's-on-Sea), D. P. Hayworth, J. R. Hobson, W. A. Hodges, J. N. Horsfield, jun., C. E. Howitt (Nottingham), S. Jaques, G. T. Jell, N. Jones (Southport), P. H. Keys, H. Langman (Southport), L. A. Loades (Morpeth), R. A. Loveitt (Coventry), C. E. Lovell, W. G. Milburn, P. Minor (Manchester), C. L. T. Morgan, A. E. Munby, M.A., N. T. Myers, G. Nott (Leicester), C. H. Perkins (Carlisle), A. P. H. Pierce, J. C. Reid (Glasgow), H. P. Roberts (Horsham), P. T. Runton (Hull), W. T. Sadler, I. T. Sifton, J. M. Smith, D. L. Solomon, A. K. Tasker (Newcastle-on-Tyne), R. W. Thorp (Headingley, Leeds), F. J. Toop, J. I. Tweedie (Annan), C. P. Wade (Yoxford), F. Wade (Bradford), A. F. Wickenden (Maidstone), W. B. Wyllie.

The Registration Question.

The following report of the Council on registration was adopted.

Section I.—The Council have had under their consideration the report and recommendations of the registration committee adopted in principle at the general meeting held April 3, 1906, and have the honour to report as follows :—

Section II.—The following principles were laid down in that report and agreed to :—

a. That the Institute should endeavour to obtain Parliamentary recognition of its membership.

b. That it be made compulsory after, say, 1912, that all architects, before receiving the diploma of membership of the Institute, must have passed through a definite course of architectural education.

c. That a temporary class of licentiates of the R.I.B.A. should be established.

d. That in future Fellows be elected—from the class of Associates; by the Council in special cases.

e. That disciplinary powers of the Institute should be increased, with power of appeal.

Section III.—The proposal that the name of the Institute should be changed to the Royal College of Architects was not favourably received by the majority.

Section IV.—In the application to Parliament for an Act the following were suggested as the essential points to be urged and objects to be attained :—

f. To declare that it is in the public interest to enable the public to distinguish architects recognised as qualified by a competent authority from those not so recognised.

g. To extend the present chartered privileges of the R.I.B.A., making it the statutory authority for the education and examination of architects for admission to the Institute.

h. To legalise a scale of charges.

Section V.—The Council have given careful consideration to all the principles above enumerated, and recommend that as a first step a revised or supplemental charter should be applied for, embodying as many of the principles set forth in Section II. as possible, and that when this has been done an Act of Parliament should be applied for as soon as practicable. They now proceed to deal with each principle in detail.

Principle A.—Parliamentary Recognition of Membership of R.I.B.A.

This is explained by Section IV. above.

Principle B.—Compulsory Architectural Training.

1. Your committee recommend that effect shall be given to this principle by altering the charter and by-laws so as to make this training a condition precedent to entering for the final examination qualifying for membership of the Institute, and legalise machinery for dealing with the subject from time to time, so as to get the advantage of experience.

Principle C.—Licentiatees.

2. It is intended that the period of entry into this class shall close twelve months after the date of the revised or supplemental charter; after that date no person shall be admitted a licentiate, and on the resignation or death of the last surviving licentiate, the class shall cease to exist. This new temporary class of licentiatees shall be a non-corporate one, *i.e.* a class having no corporate rights in the property of the Institute, no authority to control its management, and paying a subscription for a specified consideration; that is to say, they shall have the use of the Institute premises, the receipt of the Institute publications, the privilege of using the initials L.R.I.B.A. and the privilege of being present at all meetings of the Institute, except business meetings, and taking part in the discussions on papers read.

3. Licentiatees shall be persons elected by the Council within twelve months of the date of the revised or supplemental charter who have attained the age of thirty years, and who at the date of their application for admission shall have been—(a) for at least five successive years engaged as principals in the practice of architecture; or (b) for not less than ten years engaged in the study or practice of architecture to the satisfaction of the Council.

4. The Council are also of opinion that a special examination might be established for licentiatees, enabling them to enter the Fellowship class should they become in due course eligible.

Principle D.—Election of Fellows.

5. This is governed by a resolution of the Institute, June 6, 1904, as follows:—"After December 31, 1906 (extended by resolution of the Royal Institute at the general meeting of December 4, 1906, to December 31, 1907), every person desiring to be admitted a Fellow shall be required to have passed the examination or examinations qualifying him as an Associate, or shall be elected from the ranks of the Associates. But in special cases the Council,* by votes of three-fourths of such members of the Council as are present and voting at a meeting of the Council, shall have power to dispense with such examination or examinations."

6. The Fellowship is thus generally to be open only to Associates or those who have qualified for admission as Associates, but the Council recommend that it shall be also open to licentiatees under certain conditions. (See paragraph 4 of Principle C, Section V. of this Report.)

Principle E.—Disciplinary Powers.

7. The Council propose to increase the disciplinary powers of the Institute by obtaining authority to publish in the public Press the fact of the expulsion of a member of any class.

Section VI.—With regard to Section III. above, the Council do not recommend that the name "The Royal Institute of British Architects" should be changed.

Section VII.—Although such considerations are for the present outside the scope of the reference to the Council, they yet venture to suggest that the alteration of the charter and by-laws in accordance with the above recommendations might be a convenient opportunity for making other alterations, such as—

8. The modification of the by-law regulating the formal presentation of members at a general meeting.

9. The reorganisation of the machinery for filling the office of president or honorary secretary in the event of a vacancy arising from death or resignation during any session.

10. The abolition of the power given to the Council to elect direct to the Fellowship the president or president-elect of an allied society.

11. The consideration of the representation of the allied societies on the Council.

THE NATIONAL GALLERY.

THE following additions have lately been made to the National Gallery at Trafalgar Square and the National Gallery of British Art, Millbank:—

"Lulli and his Fellow Musicians at the French Court," by Hyacinthe Rigaud. Purchased by the trustees. Hung in Room XVI. at Trafalgar Square. The twenty-six pictures forming the "John Samuel collection," bequeathed by Miss Lucy and Miss Louisa Cohen, have been placed for the present in the Central Octagon and Room XIII. at Trafalgar

* The Council recommend that at least sixteen members of Council should be present.

Square. A picture by Frank H. Potter, entitled "The Music Lesson," has been purchased out of the Clarke fund. His Honour Judge Evans has presented a portrait study of Mr. John Gray, by Professor A. Legros. Mr. J. Moser has presented, through the trustees and committee of the Whitechapel Art Gallery, in commemoration of the Jewish Exhibition, 1906, "Jews Mourning in a Synagogue," by W. Rothenstein. Seven water-colour drawings by the late Mr. H. B. Brabazon have been presented, namely, two by Miss C. Atwood, on behalf of friends of the late Miss Ethel Parker, four by Mrs. Harvey Combe, and one by Mr. J. S. Sargent, R.A. These drawings, together with the three above-mentioned oil pictures, have been hung in Room VI. of the National Gallery of British Art at Millbank.

ROYAL ACADEMY LECTURES.

IN his third Academy lecture, given at Burlington House on Thursday afternoon in last week, Mr. Reginald T. Blomfield, A.R.A., dealt with the topic of "Architecture and the Craftsman." In his introductory remarks the lecturer referred to the attractive modern theory which would fain take architecture back to the days of the Mediæval guilds when the "architect," if such a person existed, was a craftsman working on the building himself, in the midst of his artistic, or at any rate building, brethren; and the very idea of a professional architect as distinct from the craftsman was out of the question. The theory was not without its fascination in these days of keen professionalism. Moreover it appealed to an instinct which an architect shared with other artists—the desire to get his ideas out at the end of his fingers, to translate them with his own hands into concrete form. That instinct, that irresistible feeling towards and for material, was an essential element in good architecture; and yet the author maintained that good craftsmanship in the sense of actual manipulation of bricks and stone, wood and metal, did not necessarily mean good architecture—that it was but an element in it, and not the whole. Mr. Blomfield proceeded to sketch the development of the theory in modern thought and by a consideration of the actual position in regard to the arts. In the earlier days of the Italian Renaissance the artist was almost invariably a craftsman of some sort, or, more correctly speaking, as an artist he practised architecture among the other arts, turning his hand indifferently to architecture, sculpture or poetry. Bramante, Raphael, Michel Angelo and Peruzzi were familiar examples. It was not until the middle of the fourteenth century that the architect detached himself from the general body of artists and specialised in architecture, as, for example, Serlio, Palladio and Vignola in Italy, Bullant and De l'Orme in France, Goujon alone drifting from architecture into sculpture. The inevitable results of this specialisation followed after a time. Not only did architecture lose a certain freedom of initiative, but it allowed the control of the decorative arts to slip into the hands of second-rate men, such as Giulio Romano or of accomplished improvisatori, such as Primaticcio. Architecture, in fact, abdicated her position as mistress of the arts. By the end of the seventeenth century the process of specialising in architecture, and, indeed, in all the arts, was complete. The architect designed his buildings and called in the painter for his frescoes and the sculptor for his images; all three were professors in one art, none of them capable of executing the work of the other two. The change was not altogether one for regret. Architecture lost the all-round craftsmanship of the Mediæval artist, but, on the other hand, it greatly advanced in technical skill and gained a deeper and wider conception of architecture as an art in itself, touching the other arts at certain points, yet having definite functions of its own to fulfil, which lay outside the provinces of the other arts. If one compared the work of the latter part of the seventeenth century with that of the earlier, the mature work of Wren with that of Inigo Jones, the designs of Mansard and of Cott with those of Lescott and De l'Orme, we found an immense advance in technique, and the result was that both in France and England, they accumulated an admirable tradition of workmanship, which lasted throughout the eighteenth century, and distinguished that century above all others in the history of modern art. Such a tradition could only have grown up from a long-continued common practice. At the end of the eighteenth century, however, a somewhat momentous change occurred. The solid inheritance of non-Classic was breaking up, the *décor* appeared on the scene and began

lay down the law in architecture, and for the second time in its history that art became a mother of literary fashion. In this case that literary fashion was a very different thing from that passion for scholarship which had influenced the renaissance of the arts. This literary fashion, which was to undermine Neo-Classic in the eighteenth century, was directed by such men as Horace Walpole, and translated into practice by Batty Langley and Capability Brown. This meant nothing less than the loss of that tradition which had kept the art of this country sane and sober for nearly 200 years. The more enterprising architects lost themselves in multifarious designs; Kent invented a lady's dress with decorations of the Orders. Robert Adam devoted his inexhaustible fertility to the design of anything and everything. In France the reaction against the frivolities of the old *régime* led to a pedantic affectation of purity, and in 1812 Perrier and Fontaine produced their collection of designs for decoration and furniture, all in the severest Classical manner, and all more or less unsuitable for the purpose. Designs which took no account of limitations of use or material had, or could have, no real vitality, and accordingly died the death, and left the way open for all the fads and revivals of the nineteenth century. In England architecture went plunging down the slope of puny Mediævalism, with Augustus Welby Pugin at the van, like the Pied Piper of Hamelin. Where the art still clung to tradition it scarcely ventured outside the limits of a Pugin scholarship, as if paralysed by the exuberance of the Gothic Revival. No doubt Classical tradition was somewhat anæmic, yet the debt we owed to such men as Decimus Burton and Cockerell should not be forgotten. It was to this last stand of the guard that we owed such battered fragments of the standard as we now possessed to guide us through the mazes of modern fashion. For the time they failed in the struggle, and English art sank to the lowest depth of degradation at the time of the Great Exhibition of 1851. Pugin died in 1852. The Exhibition marked a turning-point, and about this time there appeared on the scene that most interesting group of men the pre-Raphaelite brotherhood, and the movement had its influence not only on painting, but also on current ideas of architecture and craftsmanship. These pre-Raphaelite artists were very much in earnest, but the precise shape of their aspirations was vague. The two ideals of Mediævalism and of rabid realism seems to have been like oil and water in immediate juxtaposition, but never, in fact, in actual touch with each other. To these reformers the arts of design of the time appeared, not without reason, to be hopelessly vapid and meaningless, and it seemed to them that so long as design remained in the hands of tradesmen, among whom they reckoned the architects of their time, things must go from bad to worse. The remedy, in their opinion, was for the painter to take up the business. He was to apply the beautiful forms of nature to architecture and the arts of design, and also to learn from the visible facts of nature the principles of construction. How he was to perform that astounding feat was nowhere indicated, and nobody thought necessary to inquire, for fifty years ago architecture was not taken seriously as the art of building. The cant of nature was supreme, as was evident in Ruskin's "Seven Lamps," where he propounded many fancies which made admirable reading, but had very little relevance to architecture. It soon became evident that little was to be done by the brotherhood in the way of reforming architecture except in the minor details, in that its leaders considered architecture only from the point of view of the nomenclature. Meanwhile, Ford Madox Brown had inspired Morris and his friends. The famous firm was founded, and now the conception of architecture already referred to by the lecturer first clearly disentangled itself, and was developed into a system of life, involving fresh, social and political considerations. Morris himself, who had tried architecture and thrown it up in disgust, formulated a theory of art which boldly cut the knot. Architecture he looked upon as the occasion for a great assemblage of the crafts, in which none was to be before or after, and architecture was to content itself with the part of a vehicle for living and ornament, storied tapestries and beautiful glass. To the realisation of this view Morris devoted the last of his life, and he was no half-hearted advocate. Morris did not approach architecture from the standpoint of an architect, but from that of a craftsman and social reformer. Gothic architecture was to him the art of arts, and the art of the future beneath was believed to be the

work of guilds, because no man was supposed to stand head and shoulders over the rest, and because it gave liberal and ever undisciplined provision for the handicraft. Neo-classic, on the other hand, was hateful and unintelligible, wicked and without a soul. We owed much to William Morris, and though he misled us, his work among the arts which lie around architecture has its value. He taught us again to appreciate good workmanship, material and colour; to dislike empty-headed art and to aim high in all that was attempted. But his personal idiosyncrasy and his artistic creed led him to concentrate his attention on the handicrafts to the neglect of the larger considerations of art. The result was that the sense of the proportion between architecture and the crafts had been lost; the power of putting beautiful things together in their right relation had disappeared under a prolific growth of cheap accomplishment. The Pre-Raphaelite Brotherhood then narrowed itself down to a half-despairing championship of the handicrafts, and intensified a dangerous tendency for the production of pretty things without any necessity. We had escaped from the Scylla of Early Victorianism only to fall into the Charybdis of l'Art Nouveau. Architecture as the serious art of building did not enter into the consciousness of the pre-Raphaelites and of their successors. How else was it possible to account for the idea that it was possible to learn the principles of construction from nature? It could not be too often insisted on that architecture was not mere decoration or ornamental building, but something outside and beyond the various crafts which it called into play. The real science of architecture was the actual and practical knowledge of the means necessary to solve a given problem, and to realise a definite aim and the translation of this into beautiful building. The science of the architect was the technique that enabled him to express himself freely and faultlessly as an artist in building. In architecture, as in music, there was the deliberate restraint, the selection and play of motives, the definite and consecutive scheme in which each detail fell into its appointed place, the mastery and combination of all the parts, so that they united in this appeal to their imagination and their emotions. This quality alone justified the claim of architecture to be the most intellectual of the arts. In conclusion, Mr. Blomfield urged students to dismiss from their minds the idea that to be architects they must qualify themselves as handicraftsmen. The artistic problems to be solved were more profound; the craftsman was that which weaved all into one harmonious whole, not that of the mason or the bricklayer. Practical knowledge was indispensable, but all practical learning was only the foundation and groundwork of a higher art.

WATER-COLOUR PAINTING.

THERE are three kinds of water-colour—first, the water-colour pure, by washes of transparent colour, in which lights are obtained by getting down to the white paper again; next, the pure opaque system, in which all colours, instead of being made paler by dilution with water, are mixed with Chinese white; thirdly, the combination of the two systems, in which a work is usually begun in transparent colour and completed by the addition of opaque lights. The first resembles nothing but itself; the second has many of the qualities of fresco; the third sufficiently resembles one kind of modern oil-painting to be easily adopted by painters accustomed to that kind of work. Now an oil-painter has great difficulty in accustoming himself to transparent water-colour. A system of washes bears so little resemblance to any method possible in oil that it is long before an oil-painter can feel at home in it. On the other hand, pure body-colour has its own difficulties. It becomes lighter as it dries, in which it is exactly the reverse of oil, which darkens in drying; besides this, an oil-painter often finds it difficult to glaze over a material which, even when dry, is so easily disturbed as body-colour. But a combination of opaque and transparent colour avoids some of the difficulties of both, and the artist does first what may be most easily done in transparent colour, adding afterwards in opaque the details for which opaque colour offers its own facilities. The habitual English method of oil-painting is to paint thinly at first, often in glazing colour, and then touch the lights sharply and decisively in opaque, sometimes heavily loading, but rarely using thick colour everywhere, as many Frenchmen do.

A School of Decorative Art is to be established in Nancy by the French Government.

A Durable Building Stone.

SIR,—In answer to "J. J. M." we desire to say that the Hollington stone is without doubt one of the finest building and weathering stones obtainable, and has already attained a high reputation in our most trying and acid-laden districts, especially the red and mottled, which are particularly handsome in appearance. The dirt and smoke of our busy towns do not affect its bright and pleasing colour, which is the case with lighter coloured stones, and it may safely be relied upon to give the most satisfactory results, and can be obtained in large and reliable quantities.

JNO. STEVENSON & SONS.

Hollington, near Tean, Stoke-on-Trent.

SIR,—Our attention has just been drawn to the letter of your correspondent "J. J. M." in your issue of the 2nd inst. We would be glad to be allowed to say that we are now supplying the London market with our "Mountcharles" stone from our Mountcharles Quarries, co. Donegal, and we venture to suggest that it cannot be surpassed for city conditions. The handsome Letterkenny Cathedral, the Bishop's Palace, St. Eunan's College, Letterkenny, also demonstrate the utility and beauty of this cream-coloured building stone. It is not only the same material as used in many of the tenth-century churches, buildings and sculptured high crosses of Ireland, but also in a duplicate of one of these Celtic crosses executed and erected some fifteen years ago in St. Mary's Cemetery, Harrow Road, W.

We venture to suggest that if "Mountcharles" has so admirably withstood London conditions, as demonstrated by the perfect condition of the minute carving in this memorial, it would especially suit architectural and ornamental work in industrial centres. At any rate, we are quite prepared to submit our "Mountcharles" stone to any test required by your correspondent or any architect in England. Space does not allow us to quote details of chemical analysis, &c., which are absolutely complete and satisfactory. It may be added that our quarry equipment makes special and sufficient provision for the latest stone-steel requirements.

Thanking you in anticipation, and trusting we have not trespassed at too great length, we remain yours faithfully
(George A. Watson & Co., Ltd.), G. A. WATSON.

10 Little College Street, S.W.:

March 5, 1907.

SIR,—Replying to your correspondent "J. J. M." re "Duradle Building Stone," I have pleasure in stating that I am now, and have been for many months past, using in large quantities in St. Paul's Church, Newcastle-under-Lyme, the most reliable and beautiful building stone it has been my privilege to obtain during very many years experience in the building trade in all parts of the country. As proof of my assertion, I would mention the fact that Croxton Abbey was built of the same stone, and what remains after the havoc made by Oliver Cromwell is good to-day. The Roman Catholic church at Cheadle is another specimen of the same stone, and I know of gravestones 200 years old the reading upon which is quite legible now. This applies specially to the red and mottled quarries. The address of the owners is Messrs. John Stevenson & Sons, stone merchants, Hollington, Tean, Stoke-on-Trent.—Yours truly,

March 6, 1907.

J. TUNSTALL,
Clerk of works to St. Paul's Church.

GENERAL.

Mr. J. S. Solomon, R.A., and Professor Tilden, Dean of the Royal College of Mines, have been elected members of the Athenæum Club under Rule 2.

M. Fallières, the French president, has inaugurated the Salle Rembrandt in the Louvre, which already contains twenty-two paintings by the Dutch master.

The Court of Common Council have agreed to expend 350l. on the removal of paint from the walls and columns of the Guildhall. The work will be commenced early next year.

A Competition has been held in Paris for the position of "Architectes du Gouvernement," when the following were declared to be eligible:—MM. Albenque, Boudaud, Combaudon, Crouillard, Doll, Donaud, Durand (Félicien), Erlanger, Ferlet, Ford, Fournier (Maurice), Gangé, Giraud (Eugène), Grenier, Kunzi, Le Bel, Roger (Pierre), Schilli (Henri), Smith, Souque.

The Study for Mr. Holman Hunt's "May Morning on Magdalen Tower" has been presented to the Art Gallery Birmingham.

The Annual Meeting of the Photographic Survey and Record of Surrey will be held on the 6th inst. in the town hall, Croydon. An exhibition of the survey collection of 2,340 prints will also be opened.

The Glasgow School of Art is about to be enlarged from plans by Messrs. Honeyman, Keppie & Mackintosh, at an outlay of about 25,000l. The Treasury have contributed 10,000l. and the remainder will be obtained by local subscriptions.

Sir W. A. Golder, the assessor, has given his award of the sixty-three designs for the Welholme Church as follows:—First, Messrs. C. Bell, Withers & Meredith, London second, Messrs. Clark & Moscrop, Darlington; third, Messrs. Marshall & Tweedy, Newcastle-on-Tyne. Designs by the following are very highly commended:—George Baines & Son, London; F. Boreham & Son, London; Nicholls & Stockwell, Swindon.

The British and American Schools of Archæology in Athens (in co-operation) propose to organise a cruise of ten days, starting from the Piræus about the beginning of April and returning to the same port. The cruise is for students and any who wish to join should apply as soon as possible to Mr. A. J. B. Wace, British School, Athens, Greece.

We Regret to record the sad bereavement which has befallen Mr. J. T. Woodard, architect, of 13 Bedford Street W.C., by the death of his wife, which occurred on the 26th ult., after a short illness, at the age of seventy-three. The funeral took place at Highgate cemetery on Tuesday.

Castle Ashby, the old Northamptonshire seat of Lord Northampton, narrowly escaped destruction by fire on Monday night. Fortunately it was confined to the servant quarters.

A Selection of the paintings by Mr. Holman Hunt which were lately exhibited in Manchester and Liverpool will be lent to the Glasgow Corporation for exhibition in the Kelvingrove galleries.

A Fresco has been discovered in an oak-panelled room in what was once one of the old religious houses built in the reign of Edward IV., at Rye, Sussex. The fresco is 16 feet long by 6 feet high, with a frieze fifteen inches in depth. Just under the frieze are three panels, the first containing in five lines of Early English black lettering the opening of the Magnificat, another the second part, but the third has only the words "Glory be," the rest being obliterated. These panels are supported by cherubs.

The Designs submitted in competition for the Leavesden Road Baptist church, Watford, by Messrs. George Baines Son, 5 Clement's Inn, Strand, London, W.C., have been selected. The estimated cost is about 4,000l.

A Site has been purchased in a central position in Dundee on which a theatre is to be erected. The holding capacity of the new theatre will be between 2,000 and 3,000.

New Grove House, Hampstead Heath, which was for many years the home of George du Maurier, is to be offered for sale by auction at the Mart, Tokenhouse Yard, E.C., two o'clock on Friday, March 22, unless it is previously sold by private treaty.

Mr. Allen S. Walker, one of the hon. secretaries of the London and Middlesex Archæological Society, has been appointed by the University of London a university extension lecturer on "London Archæology and the History of Architecture."

The Paper advertised in the Brown Book, &c., of the Architectural Association for April 26, will not be read; Mr. Verity was unable to complete it in time. A paper will be read on the same evening by Mr. F. W. Simonds, F.R.I.B.A., on "Liverpool Architecture."

An Exhibition of Foreign and Colonial architectural periodicals (collected by Mr. Maurice B. Adams) will be open at the Architectural Association, No. 18 Tufton Street, Westminster, daily during next week, between the hours 10 A.M. and 4 P.M. Admission will be free.

THE WEEK.

must not be supposed that the decision in the COLLIS case will allow anybody to build as he likes, regardless of the inconvenience to a neighbour which may be caused by the increased height of the new buildings. A watchmaker in West Street, Horsham, recently applied in Mr. Justice WARRINGTON's Court for an injunction to restrain his neighbour, a draper, from erecting any building which would interfere with plaintiff's ancient lights or windows, and for a mandatory order for the pulling down of such parts of the new building as did interfere with the lights. The plaintiff said that the light to his workshop came solely from a backyard, and that his assistants worked at a bench placed at the window, and in order to gain additional light two reflectors were used. Since the building operations were commenced the light was affected in the workshop and dining-room. Evidence was given by Professor SMITH and Mr. CHATFIELD CLARKE for the plaintiff. For the defendant Mr. WHEELER and Mr. LEWIS DRURY were witnesses. Counsel for the defendant called attention to the judgment in the COLLIS case, when their Lordships said they did not regard with favour the law against interference with light and air being applied in such a way as to hinder the improvement of premises. Mr. Justice WARRINGTON said he found as a fact that, although the new building was not completed, it had affected plaintiff's dining-room, and when the building was complete plaintiff would have a diminished amount of light, and certainly would not enjoy such light as would suffice for the ordinary purposes and inhabitations of a house or businesses according to the general notions of mankind, having regard to the locality and surroundings. With regard to the workshop, the light would not be sufficient for ordinary purposes. His Lordship granted the injunction, with liberty to apply for a mandatory order respecting the taking down of such parts of the new building as are already erected, and also allowed the costs of the action.

WITH the title of the Scottish Modern Arts Association a society has been formed in Edinburgh for the purpose of ensuring the preservation of representative examples of Scottish art, more particularly by acquiring works of Scottish artists, and also to assist in the enriching of Scottish public art collections. These objects it is proposed to attain by (1) the acquisition of works of art by Scottish painters, sculptors, gravers, or other craftsmen; (2) the acquisition of works of art by artists other than Scottish; (3) the exhibition of works so acquired; (4) the endeavour to secure adequate representation of Scottish art in British national collections; and (5) the furtherance of any scheme which shall have for its object the promotion of modern Scottish art. It will be observed that the Association differs in principle from ordinary art unions, for it takes a larger view of what is desirable, and will enrich public galleries rather than the houses of the members. It was announced at the first general meeting last week that 250 members had been enrolled, that over 400*l.* had been received as subscriptions, and donations amounting to 750*l.* Sir JOHN BURLING-MAXWELL was elected as the first president, and the executive committee consists of twelve artists and twenty-three laymen.

AMONG the contests going on in cities and towns is that between residences and business premises. Trade is believed to be omnipotent and to be always able to get the upper hand; but that view is not taken by the higher Courts. We have already described the circumstances of the case *RUSHMER v. POLSUE & ALFIERI*, which was heard in the Court of Appeal as well as before Mr. Justice WARRINGTON, and we are there-

fore bound to follow its course to the House of Lords. Gough Square, off Fleet Street, is better known to Americans than to Londoners, for the former visit it because Dr. JOHNSON lived in it. Adjoining it is Wine Office Court, and a stranger would find it difficult to discover the separation between them. In Gough Square lives a dairyman, the house being used as a shop and as a dwelling-place. The defendants, or somebody for whom they were acting, became tenants of the ground floor and basement of the adjoining house, which is in Wine Office Court, and began to print newspapers. The work had sometimes to be carried on at night, and the dairyman applied for an injunction, which was granted to him. On appeal the decision was affirmed. The case was carried to the House of Lords with the same result, for the appeal was dismissed with costs. The argument of defendants' counsel was that the neighbourhood was not residential, for trades connected in some way with the production of printed matter were carried on in all the houses. Noise was inevitable, and it was maintained that as approved machinery was alone used, and care had been taken to limit noise and vibration, the additional noise must be unreasonable. The Lord Chancellor held that the noise was a serious addition to the prevailing noises, and that was quite sufficient to warrant the conclusions arrived at.

THE older representatives of criticism who are to be seen at the Royal Academy on Press days are now very few. During late years FREDERIC GEORGE STEPHENS rarely visited the galleries which he had attended for over forty years as the art critic of the *Athenaeum*. He died on Saturday in his seventy-ninth year. He was one of the earliest of the pre-Raphaelites, and his portrait appears in MILLAIS's *Lorenzo and Isabella*, which was painted in 1848, and now belongs to the Corporation of Liverpool. He also contributed to "The Germ," which was intended to be the organ of the new movement, and his portrait was drawn by MILLAIS. But circumstances compelled Mr. STEPHENS to seek employment as a writer rather than a painter. In addition to his regular contributions to the *Athenaeum*, he occasionally wrote articles for magazines; he also prepared some of the descriptive catalogues of prints and drawings belonging to the British Museum. His knowledge of English art was extensive, and he was painstaking and conscientious in all his work. Pre-Raphaelitism was not without its effect upon him throughout his life, for he believed he possessed a standard of art which was absolutely his own.

THE effort of the Ayr Auld Brig preservation committee to raise 10,000*l.* to carry out the necessary work was so praiseworthy, it might have been expected that the Town Council would approve of the proposals without hesitation. But it was suggested that if the final cost exceeded 10,000*l.* then the Council might have to meet the difference. Accordingly, the preservation committee were asked to guarantee the completion of the work whatever might be the cost. In reply they stated "that, having succeeded in fulfilling the terms of the agreement, nothing further can be required of them. The committee instruct us to say that they have gone very minutely into the cost with the engineers, and they have assured them, so far as this can reasonably be expected, that their estimate of about 9,000*l.* to 10,000*l.* will cover the cost of the necessary work. They, however, instruct us to say that, notwithstanding above, they will certainly, in the event of the necessary work costing more than anticipated, be agreeable to make some further efforts to raise further funds." The reply did not, however, satisfy the Provost of Ayr, and he proposed that the town clerk should again write stating that a guarantee should be given. As there was nobody found to second the proposal the terms offered by the preservation committee were approved.

REGISTRATION IN AMERICA.

ILLINOIS, of which the capital is Chicago, is one of the two American States having a law for the compulsory licensing of architects. In Illinois there are other towns or cities besides Chicago, and it may therefore be considered as a suitable region in which to make an experiment of the kind.

The Act to provide for the licensing of architects and regulating the practice of architecture as a profession came into force on July 1, 1897. Amendments were introduced in 1899 and 1905. The Act authorises the appointment of a State Board of Examiners of Architects consisting of five members. One of them is to be a member of the Faculty of the Illinois University and four are to be architects who have been engaged for at least ten years in the practice of architecture in the State. Two of the architects are to hold office for two years, and the other two with a member of the University Faculty for four years. After a limited time the appointments are to be made by the Governor of the State. A president, and secretary who is to act as treasurer, are also to be elected, the latter receiving a salary of 1,500 dollars a year besides travelling and other expenses. The remaining members are to be paid 10 dollars for each day engaged in the service. All expenses are to be derived from the fees received by the Board.

The examinations are to be held at least twice in each year. Any person over twenty-one years of age upon payment of a fee of 15 dollars is to be entitled to an examination for determining his or her qualifications to practise architecture. The subjects are to have reference to the construction of buildings, the strength of materials, the ordinary professional work of an architect, supervision of mechanical work on buildings and the laws of sanitation as applied to buildings. If the result of the examination appears satisfactory to a majority of the Board, the applicant, on the payment of 25 dollars, is to receive a license to practise architecture in the State. Should the applicant fail to pass the examination the fee is to be returned. Any person who by affidavit could satisfy the examiner that he or she was engaged in the practice of architecture on the date of the passage of the Act and who applied within six months was entitled to a license without examination on the payment of a fee of 25 dollars. In the case of a co-partnership each member whose name appears must be licensed. No stock company or corporation can be licensed to practise architecture, but may employ licensed architects. Each licensed architect is to have his or her license registered in every county of the State in which he or she practises, and the failure to register is to be deemed a sufficient cause for the revocation of the license. Every licensed architect is to have a seal containing his or her name, place of business and the words "Licensed Architect, State of Illinois," and all drawings and specifications issuing from the office are to be stamped with that seal.

The penalty for practising architecture without a license is to be not less than 10 dollars, and not more than 200 dollars for each and every offence. Advertising or putting out any sign or card or other device which might indicate that a person is entitled to practise as an architect is to be considered as an offence. A person is to be regarded as an architect who plans or supervises the erection, enlargement, or alteration of buildings for others, and to be constructed by other persons than himself. But draughtsmen, students, clerks of works, or superintendents and other employes of licensed architects are to be allowed to act under the instruction, supervision, or control of their employers. Any person, mechanic or builder is not to be prevented from making plans and specifications for or supervising the erection, enlargement, or alteration of any building that is to be constructed by himself or employes, "nor shall a civil engineer be considered as an architect unless he plans, designs and supervises the erection of buildings, in which case he shall be subject to all

the provisions of the Act and be considered an architect."

A license may be revoked for gross incompetency, recklessness in the construction of buildings or for dishonest practices by the unanimous vote of the Board of examiners. The holder is to be entitled to at least twenty days' notice of the charge against him and of the time and place of meeting for the hearing and determining of the charge. Notice of the cancellation is to be given to the county clerks where the license has been registered. After six months from revocation a license can be issued upon satisfactory evidence of proper reasons for reinstatement and payment of a fee of 5 dollars. The Board on those occasions is to have the power of a Court of Record, and can issue subpoenas and compel the attendance and testimony of witnesses. The accused can be heard in person or by counsel in an open public trial. Licenses are to be renewed annually on a payment of 5 dollars, and failure to renew within a month will be followed by revocation. But renewal is allowed after the prescribed time on the payment of 10 dollars.

We have received the fifth biennial report of the Board of examiners for the years 1905 and 1906. It appears that at the end of 1906 there were 704 licenses in force. Of that number 203 were licenses granted to those who passed the examinations, and 501 were granted without examination by reason of the applicants having been licensed to practise when the Act was passed. In other words, at the end of ten years two-sevenths of the practising architects in Illinois have shown their fitness to undertake the work of an architect. In another decade the proportion will be much larger, and the Board believe that by the end of thirty years nearly all the architects will be holders of certificates of qualification. An important point is the relation between the successful and unsuccessful candidates. In 1905 out of twenty-eight candidates examined in classes, eleven were rejected; while of seventeen examined at Board meetings sixteen passed. Out of twenty-two candidates examined in classes in 1906 eight were rejected, while the ten examined at Board meetings all received certificates.

One curious case is mentioned. In April an architect was convicted and fined for practising without a license, but that was only one out of ten charges which he was implicated. He appealed to the Criminal Court. But owing to the law's delays the case was not reached till December. It was understood that the applicant intended to attack the constitutionality of the Licensing Act. The Board of Examiners were ready to defend, but the necessary documents were not prepared in time. The case was accordingly dismissed without "privilege to reinstate." The defendant was in practice before the passing of the Act. He applied for examination, but failed to satisfy the Board. He was recommended to try again, but was found to be the lowest marks. In two years it appears there were only two convictions; but attempts were made to evade the Act in a larger number of instances, owing, it is believed, to ignorance of the law. The Board state that "it has been necessary in some cases to adjust the relations between architects and engineers employed by large corporations, which has generally been effected with satisfaction to all parties. Numerous complaints of supposed violations are received from licensed architects, but in many cases the offences are imaginary rather than real, and are due to an insufficient knowledge of the law on the part of the architects. For instance, the right of 'any person' (whether owner or builder) to prepare plans for and erect buildings for his own employes is not generally understood. It is often difficult to determine how much latitude is given to owners and builders under this provision." It may also be regretted that many licensed architects have been put on trial before the Board for recklessness, incompetency or dishonest practices. A number of licenses have been revoked, and some of them permanently.

stigations have also been made into cases in which architects were alleged to be connected with building or questionable practices.

The Board having doubts as to the extent of its authority in investigating or prosecuting, obtained the opinion of the Attorney-General. According to that opinion, the intention of the Legislature evidently was to raise the business of the selection and use of architects and the superintendence of the construction of buildings to the standard of a profession, and to prohibit against the employment of incompetent and unfit persons as architects." The Act, however, "makes no provision as to the manner in which gross incompetency or recklessness in the construction of buildings, or dishonest practices by licensees, are to be brought to the attention of the Board." The Attorney-General is of opinion that "the purpose was to avoid limiting the Board to any particular means of initiating the proceedings and to empower the Board to proceed in their own way to investigate alleged incompetency, recklessness or dishonest practices, and, if necessary, to formulate charges. Any other construction of the Act would destroy the efficiency of the Board."

The examiners say the opinion gives the Board even more powers than it anticipated, and should be a warning to all architects in the State of what they may have to expect from the Board. Although licensing or registration may be considered as inevitable in England, it is never likely that an English Attorney-General would tell the licensing authorities to go as far as this. For what is the meaning of the words if not that the same men are to be the detectives, the prosecutors and the judges in any case which they care to take up? There is laxity occasionally in the proceedings of American legislatures, but we cannot imagine that when the Licensing Act was put in force it was contemplated that an omission to describe procedure was intended to give unrestricted authority to a few laymen to proceed in their own way against architects who may be their competitors in business. The desire to exercise a power which would not be exercised in the ordinary courts of America is enough to suggest aims which are not inspired by an equitable and should serve as a warning to everyone in this country who while desiring to protect the practice of architecture from incompetency, should scorn any kind of inquiry which would not be endured at the same price.

THE STATUE OF COLLEONI, VENICE.

THE equestrian statue of BARTOLOMEO COLLEONI, the condottiere who commanded mercenaries himself, is one of the works in Venice which when seen are never forgotten. Mr. RUSKIN, who has taken a high rank in Renaissance work in general, which he believed to be inspired by the spirit of evil, made an exception in favour of it. "I do not believe," he wrote, "that there is a more glorious work of sculpture existing in the world than that equestrian statue of BARTOLOMEO COLLEONI." It is not to be supposed that although like OTHELLO he rendered services to the Venetian Republic, the memorial was erected out of gratitude. The old warrior bequeathed his fortune to the city on condition that a statue of him should be erected on the Piazza of San Marco. He did not know it was contrary to Venetian law to erect such a work in the public place. The Senate kept the money, and with a little that was characteristic set up a statue in front of the church of St. John and St. Paul, in what could be considered as the campo of the scuola of the confraternity of San Marco. COLLEONI probably performed many acts of evasion during his lifetime to be pardoned if intelligence of the transaction had reached another world.

The commission was given to ANDREA VERROCCHIO, Florentine. According to VASARI, after the sculptor prepared the model and was arranging for casting

it in bronze, a new arrangement was made in Venice. VERROCCHIO was expected to execute the horse, and the figure of the general was to be entrusted to VILLANO, of Padua. Naturally the Florentine sculptor was indignant. He destroyed a part of his work and left Venice. He was informed that if he ever re-entered the city he would be decapitated. In spite of this threat he was persuaded to return and resume the work. VERROCCHIO restored his model, and apparently had cast some part of it, but he caught cold on leaving the foundry and died after a few days' illness. He desired that the completion of the casting should be entrusted to his pupil LORENZO DI CREDI, but the Senate preferred that ALESSANDRO LEOPARDI should have the work. He completed it and designed the fine architectural pedestal which supports the equestrian figure. He took care to introduce his name in such a way that posterity might imagine he designed and modelled as well as cast the noble work.

The accounts given by VASARI of the final arrangements are not clear, and they would be sufficient to create some doubt about VERROCCHIO having been the sole creator of the statue. There is no doubt he was an able artist, and he had so much versatility that his great pupil, LEONARDO DA VINCI, could be considered as a magnified VERROCCHIO. Like so many of the Renaissance artists, he began his career as a goldsmith. Then he passed to sculpture, and executed works in Florence which were allowed to stand in the vicinity of the masterpieces of Ghiberti and Donatello. Next he took up painting. He was a mathematician as well as a musician, and of his varied skill sufficient evidence has survived. VERROCCHIO was an artist whose career upholds REYNOLDS'S dictum about nothing being denied to well-directed labour. But the majority of his works bear out VASARI'S suggestion, that "had he possessed the facility arising from natural powers to an equal degree with the diligence and industry where-with he was gifted, and which he bestowed on the arts he exercised, ANDREA VERROCCHIO would have been among the most excellent of masters." Evidently he recognised his own limitations. According to the legend, he ordered his pupil LEONARDO to paint one of the angels in an altar-piece for the monks of Vallombrosa, and when he saw the difference between it and one of his own angels he became so despairing that he renounced painting.

These circumstances are sufficient to excite doubts concerning VERROCCHIO'S part in the COLLEONI memorial. The latest authority who has taken up the subject is HERR EMIL JACOBSEN. He points out that the type of head adopted for COLLEONI is unlike any of those in VERROCCHIO'S earlier work. Similar types are, however, to be found in drawings by LEONARDO. The compositions which remain and which can be ascribed to the master are portraits or Holy Families which required beautiful countenances. But the engraving after RUBENS'S drawing from DA VINCI'S battle-piece, although it is only a translation of a translation, yet presents us with hook-nosed figures and the peculiar *diablerie* of expression seen in the COLLEONI statue. HERR JACOBSEN refers to one sketch in the British Museum in which a warrior has the head and neck of a lion, and it suggests that at one time the soldier of fortune from Bergamo had interest for DA VINCI, and he amused himself in forming a pictorial expression of the name Col-leon.

How far would dates allow of the co-operation of DA VINCI with his master for such a work as the Venetian memorial? COLLEONI died in 1475. The commission for the monument would not be given for four or five years afterwards, or say 1480. Now in 1472 LEONARDO'S name was inscribed in the red book of the debtors and creditors of the Florentine company of painters. As well as can be made out, he remained in Florence until 1483, when he wrote his famous letter to the Duke of MILAN announcing his capabilities as a painter, sculptor, architect, civil and military engineer. In the course of it he states:—"I can conduct and bring

to an end every kind of sculpture in clay, marble and bronze. I am able to execute also the equestrian statue of bronze which is to be elevated to the immortal memory of your father the Duke and the noble family of SFORZA." We may be assured that DA VINCI was always careful to base his knowledge on experience. Up to 1483 he was accessible to VERROCCHIO, and could have taken part in preparing models or in the casting of bronze with his late master. VERROCCHIO died in 1488; and, as we have said, his death was caused through the operations required for the completion of the statue. According to some accounts the work was not finished until 1495—a time when DA VINCI was engaged on *The Last Supper* in Milan. It was therefore quite possible for DA VINCI to have aided VERROCCHIO through all the stages of the commission for the COLLEONI memorial. From the elder artist's character, as exemplified by his abandonment of painting after his pupil had painted a figure, it is not likely that he would have copied one of DA VINCI's designs or models. We are therefore authorised in assuming that it was more likely DA VINCI modelled at least the head of the Venetian warrior. We might go further. COLLEONI is not represented as looking straight in front of him. The head and chest are partly turned on one side. It can be observed in DA VINCI's paintings that he often introduced a similar arrangement. And indeed we can see it in the works of his immediate followers.

It should be noted that in 1892 a view of the statue appeared in *The Architect*, and one of our contributors offered the following suggestions, which anticipated the speculations of Herr EMIL JACOBSEN and Dr. MACKOWSKY on the subject by several years:—

It is supposed by Cicognara that the statue was recast by Leopardi, from which it might be inferred that the impressiveness of the work is owing to the Venetian sculptor. What seems to be not unlikely is that the remarkable effect which is produced on all who look upon the figure is to be credited to Da Vinci rather than to his master or to Leopardi. Is there any reason to make the co-operation of Da Vinci improbable? When Verrocchio discovered that his apprentice could paint better angels than himself he may have suffered depression for awhile, but there could be no rancour, for the Renaissance artists were accustomed to victories of that kind. There was no obstacle in the transaction to make it obligatory that the master should not afterwards invoke the aid of his conqueror. Now there is nothing, so far as we know, corresponding with the head of Colleoni in any of Verrocchio's figures in Florence. As a sculptor he was more esteemed by his contemporaries for his industry than for his genius. On the other hand, Leopardi's stands or sockets for the masts in the Piazza of St. Mark are so excellent, we are not much surprised at his capacity to design the pedestal in the Piazza of St. John and St. Paul. That he had sufficient power to design the equestrian statue is not, however, indicated by any of his works. In fact, the Colleoni memorial is very suggestive of the interposition of a "ghost." It should be remembered that about the time when Verrocchio was occupied with the commission for the memorial of Colleoni, in Milan, Da Vinci was engaged on an equestrian statue of Francesco Sforza, who was one of Colleoni's rivals. Is it not probable that under such circumstances Verrocchio would have compared designs with Leonardo, and have availed himself of the aid of his pupil? The head of Colleoni is remarkable, but it is allied to some of those that are introduced in the *Last Supper* and to many that are seen in Da Vinci's sketches. The projecting brow which makes the eyes appear as sunk in a cavern, the aquiline nose which almost touches the upper lip, the capacious and merciless mouth, resemble details in the sketches which also show faces that are as truculent in expression as the old mercenary appears. It is now impossible to realise what sort of statue of Sforza was modelled by Da Vinci. The sketches which are supposed to relate to that work reveal the over-fastidiousness of the artist. The bronze statuette of a horse that is believed to be a copy of Da Vinci's does not express the strength which was necessary in an animal that was to bear the weight of a figure in heavy armour. Great as he was, Leonardo was often unable to put forth all his power. If we could, therefore, assume that Da Vinci helped in the realisation of the

Venetian work it would not be necessary to conclude Verrocchio was a mere looker-on; it is likely that strong common sense and his devotion to realism may have translated Da Vinci's ideas into the impressive form which seems to command in Venice.

The subject is deserving of investigation on account of the importance of the work, and still more because the world does not possess any example of DA VINCI's power as a sculptor.

ROYAL ACADEMY LECTURES.

IN his fourth and concluding lecture of the present course to the Academy students, delivered on Monday, March 12, Mr. Blomfield took as his subject "The Limitations of the Arts." He pointed out that there were far more difficulties in the theory of art than the differentiation of the end and province of the various arts—a subject that has been treated with some neglect in modern criticism. The critics of the school of 1850 were preoccupied with the moral qualities of artists or with the literary possibilities of their work. Their successors had devoted much attention to the minute discrimination of matters of technique in their application to pictures; but the connoisseur had not profited at the expense of the artist, and there seemed to be room for the old-fashioned dissertation on first principles, for an attempt to reach the artist himself, and an attitude that he was justified in assuming towards his work. An effort had been made, on the other hand, to grapple with the scientific study of aesthetics, to ascertain the mental grounds on which the æsthetic emotions were based. The results of these extremely scientific methods were, however, not convincing. The theory was that our æsthetic pleasure in objects was derived from our inveterate habit of imagining ourselves into those objects, and of conceiving ourselves as fulfilling those functions. Thus, our sense of the beauty of a well-proportioned column was said to be the satisfaction that we felt in imagining ourselves adequately discharging in our person the duties of a column. In short, that this æsthetic sense was only one phase of the anthropomorphic instinct of man. As practical artists, we do not think they would find this theory of material value in their work. They might leave it to the industry of German speculation, and start a little further on with the fact that certain human creations did raise within us a certain thrill of feeling. This fact might be taken as a datum for further researches into the past. He should attempt to get some account of what had been done in establishing the working purposes the relations and the differentiations of the various arts by the great thinkers of the past, and draw some conclusions from their teachings for practical guidance. In so doing he should limit himself to a rough sketch of the teaching of the three foremost thinkers on this subject—Plato, Aristotle and Gotthold Ephraim Hegel. The most remarkable fact in Plato's philosophy was, said the lecturer, his ingrained suspicion of art. Aristotle said Plato was merely an affair of imitation, and as such was to be eliminated from the training of his ideal state. Plato did not deal with art until the tenth book of his "Republic," and there the artist was dismissed with contempt. The appeal that the artist made being regarded as made to the lowest elements of our nature. Plato's words were severe in their emphasis:—"Imitative art is far from the truth when it discharges its function; and for no true or healthy purpose it attaches and devotes itself to that element in us which is far removed from wisdom." Such a principle as this, less matter as imitative art was not, therefore, to be discussed any further. Plato's conclusion seemed to the lecturer either a piece of superb irony or the result of too unyielding logic. Plato subordinated the arts to the music itself, to the over-mastering purpose of perfecting the soul. He banished all arts from his State, except such as had some ethical value, and this he retained not on its own merits but "ophelious eneka," for its use and benefit in training the soul. It was not easy to reconcile this with another view of Plato's, that each art should be perfect within itself. If a picture was perfect within its own intention it surely came illogical to reject it because of its failure in its ethical value. Plato's theory was distinctly disappointing. Aristotle, the scientific thinker, was far more sympathetic towards the first time he established the distinction between the fine and useful art, and though such a distinction was most irritating to those who maintained the unity of the arts, it was a distinction that had, in fact, always been obvious, and it was a great step forward to recognise the possibility

of a serious function in art. Aristotle admitted, under certain aspects, art had its proper place in the scheme of life, and this, not merely as a side issue, which might mean little or nothing as far as art was concerned, but as there in its own substantive right. When we come to Aristotle's treatment in detail artists were doomed to disappointment, for Aristotle in dealing with art was almost entirely occupied with poetry. The business of fine art was to show men in action; its end was to purify the emotions by exciting and discussing them. Sculpture and poetry might satisfy his purpose when stated in the general terms, but only in a very limited sense. As for architecture, as it was not supposed to interpret human emotion in action, it was implied not mentioned; no doubt being considered merely as a useful art. More than this, the end of art, with Aristotle, was the impression that it made on the spectator or the audience. There was thus a wide gap between the view of the ancient world that the artist was there solely to contribute to the wealth of true life, and the modern view that, in addition to that, the artist might also take into account the realisation of himself. They had thus advanced a very little way the modern standpoint. The existence of graphic and plastic art was now recognised by the Greek as worth consideration, but its creations simply entered into the scheme of his life as a citizen, and that was about all. In the ardour of his politics, his literature, and his philosophy, he did not attach the first importance to masterpieces which ever since his time had been the standard and canon of the world in the arts of architecture and sculpture. Nor had he considered very closely the relation of the arts to each other. It was perhaps fortunate that in succeeding ages literature left the arts severely alone. Mistakes were made, artists attempted too much; but, at least, they were not fogged by hasty theories of the relations of poetry to the arts, until in the eighteenth century the literary man arose in his might and annexed the whole domain of the arts as subject-writing, in which he was to lay down the law and the artist was to carry it out. A literary man and a philosopher, Gotthold Ephraim Lessing, once and for all overthrew the idea that poetry and the arts were convertible terms. Lessing was not particularly interested in any of the arts except poetry; but he possessed great learning and an active and intensely logical mind, and the fallacious thought of his contemporaries seems to have exasperated him into the writing of the famous "Laocoön." Lessing's memorable essay on the ends and limitations of the various arts was the most acute and profound piece of criticism ever written. Lessing's position was twofold:—(1) That the arts differed in subject and treatment; (2) that the end of art was pleasure. His method was desultory and apparently inconsequent, and he repeated himself; but the main weight of his criticism rested on the first principle. The gist of it was contained in a quotation from Plutarch, which Lessing applied to his own sense. The arts, he said, differed in the subject-matter and the methods of their imitation. The artist employed forms and colours in space; the poet articulates sounds in time. Therefore the right objects for the painter and sculptor were objects or bodies which co-existed, which were to be seen side by side, and whose impact on the senses were to be rendered at one given moment of time. The poet, on the other hand, had to give consecutive impressions; he could only express himself by a succession of sounds or words. His business, therefore, was to make us realise action—objects which succeeded each other in time. Given this principle, all sorts of consequences followed. Subjects which were legitimate for the poet were ruled out of court for the artist. Again, it was possible for the poet to make his appeal to the emotions by methods which were not open to the artist: the poet could deal with consecutive action, whereas the painter had to select some definite moment for his work. He had to deliberately forego much that was possible to the poet. Lessing argued that poetry, and even, generally, literature and the plastic and graphic arts, were not convertible terms; that it was wrong to transfer subjects and methods from the one to the other without recasting them mentally, without definitely realising the limits and conditions of the art in which the artist sought to express himself. For example (said Mr. Blomfield), in a recent prize competition, the palace of Bacon's "Essay on Building" was set as the subject of design. This was wrong in principle, for what might be legitimate enough in a prose picture, where the writer only attempted to suggest the idea of a certain building, became unintelligible and unworkable when literally translated into the lines of an architectural design. It was

for his insistence on this point that Lessing's work was of such permanent value for artists. Lessing himself seemed only to have taken a theoretical interest in the arts apart from poetry. Thus he regarded landscape-painting as an altogether inferior art, because it was not occupied with ideas in action. Dealing with invention, Lessing maintained that this was shown, not in the discovery of new subjects, but in the arrangement of old, inasmuch as the artist's work should be intelligible at the first glance. He had little sympathy with wayward artists, as indeed was shown in his other proposition, that the end of all art was to give pleasure—a position which left out of account the personal equation of the artist himself, whose object in his work might be to realise his own powers, to energise himself. Certainly the artist who set out in his career with the sole object of giving pleasure would be a desperate failure. Behind fine work in all the arts lay passionate emotion, which impelled a man to design architecture in one way, and one way only. The impulse was from within, and as such defied classification. Lessing seemed to ignore this: given the motive impulse which started the artist on his work, Lessing supplied certain leading principles by which the artist was to work in accordance with the limits of his art, or as Aristotle put it:—"It is not any and every pleasure that should be sought from tragedy, but the pleasure which was peculiar to tragedy." At this point Aristotle and Lessing left us to our own devices. What was the "peculiar pleasure" of painting, and sculpture, and architecture? The object of art was a somewhat complex affair. It was partly no doubt to give pleasure, partly the result of an irresistible impulse in the artist himself to render his ideas and emotions artistic and intelligible; partly, at least in architecture, to answer certain definite needs and conditions. Somewhere along these objects at any rate would be the end of art, but it was very material how that object was attained. The pleasure obtained in art was the pleasure of beauty—beauty of form, of colour, of light and shade, of rhythm and proportion. The beauty aimed at by the arts was no one standard and unalterable form—rather, one would say, there was in this world, in nature and in life, an inexhaustible reserve of beauty—beauty only to be seen by the seeking eye, and made visible and concrete by the skilful hand. Truth might be at the bottom of a well, but beauty lay everywhere for those who could see it. Yet everything was not beautiful, or rather in the existing state of our faculties we could only think of certain things as beautiful. Our sense of beauty, with all its limitations and imperfections, had been built up by countless generations, and through innumerable associations beyond the reach of any profitable psychology, and artists might be justified in taking it for granted that certain things would always be considered beautiful and certain things ugly. The quality of selection was surely at the root of the matter; the power to see for oneself what lay in a subject. Both sculpture and painting rested on a convention, in that we hoped to accept this as representing the objects that they purported to represent; but in so far as they appreciated direct and literal realism, this endangered their convention, and ran the risk of being estimated by students out of relation to art. Tussaud's figures were more like the originals than any marble figures could be, yet they made no appeal to us. The reason was that they had not passed through the fire of an artist's thought, and that, in so far as they challenge comparison with reality, they were obviously absurd. The difficulty was to know how far realism should go and when it stops. The full use of colour in sculpture seemed to the lecturer to be outside the true province of that art. Selection became doubly necessary in sculpture. Its method of expression was less obvious, and more a matter of abstract thought than that of painting. An artist would hardly select sculpture as the art in which to tell a story, although it had been constantly done by inferior men—*eg.* in the elaborate carved scenes round the outsides of the choirs of Amiens and Chartres. Here there were as many as five or six places of crowded figures, whose action was absolutely unintelligible without careful study, and whose value as an integral part of architecture as surface treatment was actually less than a drupe of ornament or a rusticated surface. The actual sculpture was extraordinarily skilful; but the failure in effect was due to a misapprehension of the function of architectural sculpture. Architecture was the Cinderella of the arts, the art that Aristotle considered not as a fine but only as a useful art, if an art at all; that others had recognised on moral or literary grounds, or had accepted as the more valuable of ornament. Architects would not accept this position, yet there was no doubt that

architecture to some extent stood apart from these other arts. It was, firstly, in no sense imitative. Architecture, indeed, followed nature—hardly in the sense that nobody could put up a fine building who had not mastered the ordinary laws of statics and dynamics, and acquainted himself with the materials he employed. Secondly, an architect did not select his subject. He had to work under the conditions of the problem he had to solve, of the site and the materials of his building. The architect was there to produce an organic composition—not some picturesque detail, but a whole in which those details combined for a united impact on the emotions. Picturesque details had not in themselves any relevance to architecture, but were merely the notes which the composer uses. They only ranked as architectural value by their relation to the other constituent parts of the design, and by the skill with which they were treated in regard to the whole effect. Architecture was not cabinet-building nor goldsmith's work, but a genuine masculine art, and its province was the handling of masses of material. This point was of vital importance, and had always been overlooked in periods of indifferent architecture. An architect should always have before him the effect of his building as a whole. All his ability and dexterity, the skill of his colleagues, the beauty of his materials, were wasted unless this was kept in view, and all his energies should be devoted to this unity of effect. Another limitation of architecture was to be found in the fact that in the lapse of ages there had grown up within us certain instincts of æsthetics, which were not to be set aside. The forms of architecture were now very old, in the same sense that the words of a language were very old. Nobody had yet asserted that the possibilities of the English language were exhausted, and it was equally so with architecture. The architect's invention and originality were best shown in the use he made of accepted forms.

SEVENTEENTH-CENTURY ARCHITECTURE.

ON Thursday evening, the 7th inst., a lecture on "English Architecture in the Seventeenth Century and the English Country House" was delivered before a crowded audience at Carpenters' Hall, London Wall, by Mr. C. R. Ashbee, M.A. He commenced by stating that the majority of the old monastic buildings were replaced by the country houses, and the local patronage and powers of the abbey were transferred to the new lord of the manor. The young aristocracy of Henry VIII. and Elizabeth were worthy followers of the monastic régime, and they left the mark of their generous life upon their houses, their gardens and the cottages of their tenantry.

At Penshurst, at Hatfield, at Burleigh and at Audley End we have the great central hall, where the whole household met at the common meal, where there was often music and recitation going on. The manner of living was simple and at the same time sumptuous; there was no luxury in our sense, but simple and generous fare, with a few finely made vessels to contain it and pewter or wooden platters to eat it from. In the centre of the table stood the salt, often a superb piece of work in silver or gilt. At many of the older halls, such as Haddon, there are chapels, where the whole community worshipped, one of the retainers acting as chaplain, and some of the great rooms were as a rule given to dancing and music and paintings. Among the earlier Elizabethan aristocracy the whole community lived and shared their life together. The people, like all English people, except they are enervated and degraded by industrialism and great cities, loved the open air and the sunshine; their life was out of doors; they hunted and hawked and coursed in common. One of the most beautiful and suggestive sights among the old halls of England is the open air theatre at Penshurst, where they acted Ben Jonson's plays in a half circle of grass sward dug in the park, with the trees and flowers and summer sky of England around them. If you read "Twelfth Night" and "As You Like It," you will get some idea of what went on on an August afternoon at Sir Philip Sidney's home. Life alternated between a picnic in the Forest of Arden, a musical masque at old Capulet's, and the healthy boorishness of the house of Petruchio, when he brought home the shrew; that was the life of the aristocracy of Elizabethan England. The truth of this is proved by the architecture. Haddon, Burleigh, Audley End, Newstead, Hardwicke, Longleat, Montacute, Bolsover, Knowle, Hampton Court, Welbeck, Penshurst, Hatfield, and many others, are the books in which we read the inner life of

England in the seventeenth century. From the laying out of the whole plan to the minutest detail the story of Elizabethan government and manners is told in them. Their peculiar charm is that they are English right through. The England of Elizabeth, moreover, showed an amazing power of assimilation. Everything flowed into her, and by the strength of her character everything was transmuted.

John Thorpe's book of plans is among the most interesting workshop records of the sixteenth century left to us. We have in it some of the houses he built, and many that were either never carried out or, being unnamed, cannot now be traced. Somerset House, Burleigh House, Holland House, Giddy Hall, Audley End and Kirby are among the number, and perhaps the most interesting is the house, the "whimsical edifice," as Horace Walpole affects to call it, that the artist designed for himself. The place is in the nature of a setting together of the two letters I . . . T. A corridor joins them in the centre. Scribbled in a marginal note at the side of the architect's design is the triplet:—

These two letters I and T
Joined together as you see
Is meant for a dwelling-house for me.

JOHN THORPE.

And it was just such a metrical conceit that the Elizabethan loved in architecture as in verse. We have in some of the houses great balustrades cut out in letters, of Latin inscriptions or verses, twisted scrollwork of stone with lovers' knots, half-timberwork with parqueting that bewilders you in its variety of pattern and subject detail, and every manner of playful and graceful arrangement in stone and timber. Utility was then as it always must be the basis of all sound and honest building, but there were other things in human life that were regarded as being equally necessary to the making of a citizen, and these the architecture brought out. Horace Walpole of a later and prosier age may call them whimsical if he will.

That the final architecture produced, if not so noble as that of the work of the Mediæval church, was great, goes without saying, but regarded as Domestic architecture the building of the house, the home, the shell of the family life, nothing has been ever produced that will equal the great Elizabethan hall for serviceableness of purpose, for beauty, and for the expression of the simple dignity of life. The ordinary plan of the Elizabethan house is either that of an E or an H, and if you wish to be whimsical you may trace that in compliment to Elizabeth or Henry; if you look closer into the manners of the time you will find that it was the most obviously practical and serviceable form of planning a mansion that could have been devised. The larger the house became, the more variations did the architect play upon the H motive, and the conditions of life necessitated largeness and roominess of building. Not only had the house to be planned for the ordinary use of my lord and his retainers, not only had there to be the common hall, chapel, kitchen and a few private rooms, with the all important stables outside—the house had to be planned too for possible royal receptions; there had to be state apartments, usually the suite on the first floor to the front; the queen might come some day, some day there might be a royal progress, and that was an event great above all others.

The central features of the seventeenth-century house then were hall, chapel, suite of state rooms, guest chambers, kitchen and offices, and stables. In plan these inevitably tended to group into courts, the stables being arranged outside in a separate block, but so that when you came to the house you rode through them first and got off your horse. And yet with all this the Elizabethan house would have been incomplete, the most important object of all would have been deemed wanting, and that was the garden which was often laid out before the house itself. The most beautiful house in England is Montacute in Somerset. Its peculiar beauty consists in that it is to-day just as it was in the days of Elizabeth; the family having been never too poor to sell it and never too rich to improve it. In closing his picture of the Elizabethan hall and the life that it expressed the lecturer recited a ballad, "The Old and Young Courtier," whose author is unknown, but which from the ring of it might have been composed by Raleigh in his last weary hours in prison, when he reflected how the great life of the Elizabethan age was passing away.

The lecture was illustrated with about twenty lantern slides of the large houses referred to, and at the conclusion a vote of thanks was accorded to Mr. C. R. Ashbee, as well as to Lord Addington for presiding on the occasion.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

At a meeting of the above Society on Thursday, the 7th inst., Mr. Percy Robinson, F.R.I.B.A., lectured on "Architectural Sketching in Yorkshire." The president, Mr. H. S. Chorley, occupied the chair. The lecturer remarked that this lecture being coincident with the revival of the Society's Sketching Club, it occurred to him that his remarks would be most useful if addressed more particularly to the younger members of the Society. Commenting on the necessity of studying the best old work, he said there was no better method than sketching in order to become thoroughly saturated with the spirit of it. Sketching entailed an almost unconscious analysis of the work, and many subtle beauties were thus revealed that in a more casual observation would pass unnoticed. The ideal method of study is a combination of sketching and measured work. Of method and materials little need be said; technique is largely a matter of temperament or individuality and will develop itself. Each man chooses the method and medium best fitted to his own particular feeling or the rendering of the subject. For diversities of technique compare the work of Raven Hill and Phil May; or in the domain of architecture compare the tricky suggestiveness of Herbert Railton with the restrained and archaic linework affected by what is known as the Birmingham School. As regards subjects, sketch old buildings for their architectural features as far as possible, but if these are not to hand you need never be at a loss; go further; broaden your views and enlarge your knowledge by extending your researches into the realm of nature; study the human figure, animal and vegetable forms of all kinds, remembering that nature is the basis of all design. Even landscapework is useful in training the eye and cultivating a feeling for mass, outline and colour, while at the same time it tends to correct that stiffness and lightness of drawing which the architect almost invariably acquires from the constant use of the T-square. The lecturer then gave a summary of some of the lesser-known subjects for the architect's pencil in Yorkshire, which he thought might be useful and suggestive to the Sketching Club in organising their summer excursion.

The lecture was illustrated by a collection of Yorks sketches by the lecturer and other members of the Society.

PEVENSEY CASTLE.

A MEETING was held in Pevensey on Saturday. The famous ruins of the Castle standing prominently at the entrance to the village were, says the *Sussex Daily News*, the subject of investigation and direct cause of the large gathering of antiquarians and archaeologists. In August last, it will be remembered, permission was obtained from the Duke of Devonshire to excavate in the Roman area of the castle. The meeting on Saturday was called by the principal workers to report to those interested the progress of the investigations since the work was commenced, this being with a view of enlisting additional support and to strengthen the financial position. Such a quantity of old curiosities and implements have been discovered that it was only possible to place samples on view to the visitors, who examined them previous to the meeting. Mr. Pears first gave the general history of the castle and the adjacent shore, saying the ruin was one of the Roman forts of the Saxon shore protecting the east and south coast from the incursions of the Saxon pirates. He pointed out that it should always be remembered that digging a Roman fortress was not the same thing as digging a Roman town, as the latter would supply many more interesting finds. The excavations at Pevensey Castle were an attempt to reveal the history of the village, which must be interesting and important.

The duty of entering into a full explanatory speech concerning the actual excavations was entrusted to Mr. Ray, who spoke with a clear and practical knowledge of the work, and gave a very lucid description of it. He said the work naturally divided itself into three parts, viz. (1) preliminary work; (2) excavation to expose the postern gate and foundation of the wall, and also the eastern gate; and (3) exploration work in the area of the castra. In order to ascertain the nature of the ground seven experimental shafts were sunk, it being hoped that one of these would strike a path which might have run across the castle from postern to postern, and also because that direction was apart from any previous excavation work. A dip was found westward of the line of boulders which indicated the sup-

posed path, which was found covered with black earth and a lot of animal remains. Operations were continued at the northern postern gate, but few finds were recorded, this area having been previously excavated in 1852. The main object was to uncover the foundations of the wall and the postern gate with a view to making an accurate plan. A trench parallel to the southern boundary proved very interesting, from the fact that it disclosed the depth of the tipped clay and indicated that the original surface in Roman times approached very nearly the level of the present surface. At the western end there was a considerable depth of black earth, where more articles were found, including a coin of the Constantine period and many pieces of distinctly Roman pottery. In a northern trench a coin of Carausius was found, and upon proceeding in a western direction, a peculiar arrangement of tiled patches were unearthed, the tiles having a carved surface. The trench running diagonally towards the Mediæval castle did not produce as much pottery or animal remains as other trenches. Mr. Ray had prepared a number of sketches which materially assisted in explaining his remarks.

Mr. Pears mentioned that real Samian ware had been found, and this was very uncommon, though there were imitations. The coins were of the latter part of the third century, which showed that the site was occupied at that time, though the walls might not have been built then. The walls were not necessarily evidence of the first occupation of the site.

In making an appeal for further contributions, Mr. Saltzman informed the company that work would shortly be started in the inner castle, and the keep would be explored, Mr. H. Sands having consented to assist. Altogether 65*l.* 12*s.* 6*d.* had been subscribed, and the expenses had amounted to 68*l.* 17*s.* 6*d.* He asked for about 20*l.* with which to again commence work.

TWO CITY CHURCHES.

A PARTY of members of the London and Middlesex Archaeological Society assembled on Saturday in London Wall for the purpose of inspecting the old church of St. Alphege. The building is comparatively modern, but attached to it is a dwarf tower, invisible from the street, forming a vestibule to the north entrance, which is said to date from the fourteenth century. This tower is the last remaining part of the priory of Elsing Spital, founded in 1329 by William Elsing, mercer, for the support of one hundred blind men. The church is a plain square hall of moderate size, and on æsthetic grounds alone no one would regret its threatened removal under the provisions of the Union of Benefices Act. Mr. Allen S. Walker, one of the honorary secretaries of the Society, in the course of an interesting account of the historic site, made out a good case for the retention of the tower, which he contended was the last piece of Decorated ecclesiastical architecture left in the City. Mr. Walker subsequently conducted some of the members into the tower, and pointed out the chief features which gave evidence of the early date of its erection. The company then walked past the remains of the old London Wall to St. Giles's Church, Cripplegate, where Mr. Charles Welch acted as conductor. The vicar, Prebendary Barff, and the churchwarden, Mr. Deputy Baddeley, to whom the recent alterations and improvements are so largely due, were unable to be present, but sent kind messages of welcome. Mr. Welch called attention to some of the objects of interest in the church, quoting largely from Mr. Baddeley's book; and the visitors afterwards had an opportunity of inspecting the ancient registers, in which are recorded the burials of Oliver Cromwell, John Milton, Foxe and others, while page after page testified to the havoc wrought by the Great Plague in the seventeenth century. Votes of thanks were passed to the clergy and wardens of the church and to the secretaries of the Society.

The Dundee Town Council last week considered the recommendations of their electricity committee that a new generating station with two sub-stations, along with all the necessary plant, at a cost of about 51,930*l.*, be constructed. The scheme was agreed to, and it was decided that Mr. Richardson, the electrical engineer, should carry through and superintend the work. On a division it was resolved by fifteen votes to thirteen to stipulate that the engineer should have no claim for extra remuneration.

NOTES AND COMMENTS.

WE have repeatedly called attention to the peculiar system adopted by the Dublin Corporation with respect to contracts, in order that our readers might be warned and take adequate precautions for their own security. Another remarkable example was afforded by a meeting of the City Council on Monday. The Corporation lately let a contract to Messrs. CRAWFORD & FRAME for the main drainage of Clontarf, which is one of the suburbs. Mr. FRAME was described as a respectable citizen who carried on an extensive business in the city. Mr. CRAWFORD was a Glasgow contractor. The meeting held on Monday was for the rescinding of the contract, although it appears it had not been sealed. The reasons for so sudden a change are remarkable. An Irish contractor had, we believe, sent in a low tender, but as the work was onerous he wished to have somebody with special experience to share the responsibility. Mr. CRAWFORD travelled to Dublin to inquire about the matter, with the result that in connection with Mr. FRAME he proposed to carry out the work. It was alleged that the Corporation were induced to believe that a new industry—the making of pipes—would be introduced in Dublin. As many men were unemployed in the city it was considered desirable that no delay should take place, and the sanction of the Local Government Board was asked to handing over the contracts. It was specified that stoneware pipes were to be used. But specimens of earthenware pipes were received and were rejected. It is quite possible that imaginativeness caused members of the Corporation to conclude that an inferior class of pipe would be used, when all that was done was an effort to discover the particular class which was desired. At all events, a meeting of the Council was summoned in haste, and all parties agreed to have the unsealed contract rescinded. It was then proposed to accept the tender of Messrs. BINNS, of Croydon, amounting to 46,342*l.* 7*s.* 9*d.* But an amendment was proposed that the work should be done by day labour, and it was finally resolved that the improvements committee should carry out the work, "provided that the amount to be charged against the Corporation for direct labour does not exceed Messrs. BINNS's tender, and that the consent of the Local Government Board be obtained." The consulting engineer's estimate for the work is 52,000*l.* The case should serve as an additional incentive to circumspection when English or Scottish contractors tender for Irish work.

THE abbey of Mont St. Michel was founded in 708, but the buildings have been altered, some removed, and others substituted for them at different ages. In 1607 a mill was erected, and near it a tower arose which was known by the name of the Tour de Moulin. Everyone is aware that there are a great many towers connected with the wonderful abbey. For indeed from a very early age it was necessary for the abbots as feudal lords to provide for defence, like a great many of the nobles of Normandy. The Tour de Moulin enjoyed the peculiarity in modern times of having a different authority to the other buildings. Mont St. Michel was regarded as if it were a single historic building, and was under the control of the French Minister of Fine Arts. But officialism decided that the Tour de Moulin was of a different character, and it came under the control of the Minister of Public Works. The arrangement caused more or less inconvenience, and it has been at length decided that the Minister of Fine Arts is to have supreme control over all the ancient buildings.

ILLUSTRATIONS.

NEW PREMISES FOR THE SCOTTISH PROVIDENT INSTITUTION, LOMBARD STREET, E.C.

A DESCRIPTION of this building appeared in our issue for February 15 last. It was designed by Messrs. DUNN & WATSON, and erected under their superintendence. Otis lifts of the very best modern

type have been adopted, electrically controlled and organised so that very few people need use the staircase. At present only two are fixed but there is space reserved for four. The floors of the staircases are of reinforced concrete on the KAHN system, executed by the Trust Concrete Steel Company. The marble &c., pavings are the work of Messrs. BURKE & CO. and the hot-water heating and hot-water supply (which is of a very special character) was carried out by Messrs. JEFFREYS & Co., of Queen Street, Westminster. The electrical cables were supplied by HOWARD F. GEERE. The ornamental ironwork at the entrance and some of the lift enclosures was done by Messrs. SINGER, of Frome, while some of the small ornamental work was by Messrs. MORRIS & Co., Westminster. A large portion of the ornamental ironwork, it may be added, was done by Messrs. CUBITT & Co., as well as the plumbers' work and the sanitary arrangements. The Standard Sanitary Manufacturing Company supplied the lavatories, and Messrs. DOULTON the urinals.

"FAITH"—A WINDOW IN THE TEMPORARY CHURCH OF ST. BARNABAS, MITCHAM.

ST. JUDE'S PAROCHIAL BUILDINGS, NEWCASTLE-ON-TYNE.

THIS building is to be erected in lieu of the present parochial buildings, in a ravine about to be filled in by the Corporation. The plans and designs were prepared by the diocesan architect, Mr. ARTHUR PLUMMER, F.R.I.B.A., of Newcastle and Tynemouth, and the building is to be erected on a site immediately opposite the basilican church of St. Jude, designed some years ago by the same architect. The new parochial buildings will be built in brick with stone dressings and slated with green slates. The facing bricks will be Messrs. LOWRY'S, of Newcastle, best red pressed bricks.

PLAN INDICATING POSITION OF ROOMS IN PROPOSED LONDON COUNTY HALL.

WE reproduce the approximate plan of the principal floor of the proposed London County Hall from the instructions to competing architects. There is to be a Council chamber, two lobbies, two committee-rooms and rooms for chairman of Council, secretary, waiting-room, vice-chairman and deputy-chairman. Suitable accommodation, amounting in the aggregate to an area of 16,000 square feet, for the general use of members is to be provided. The library is as conveniently situated as possible to the Council chamber, and the hall is to seat 800 persons. The whole of the principal floor is to be devoted to the accommodation as set forth in the schedule, and to the accommodation of the heads of departments, &c., who should be located as near the committee-rooms as possible. Such accommodation should consist of rooms ranging from 350 to 500 feet super. for the heads of departments, &c., a small waiting-room and also one or three rooms for each department, &c. The Council chamber is to have a gallery for the public, to seat 50 persons, and lavatory accommodation for both sexes, and entrances and exits, so arranged that the public do not traverse any portion of the building not set apart for their use. A gallery for the Press, with separate entrance to the hall, also arranged. A room of about 500 feet super. for the Press, with lavatory accommodation close at hand, is to be provided, but this accommodation need not be on the principal floor. There should be also provided ample cloak-rooms for members, fitted with lockers (the total number of members may be taken as 200), and telephone, &c., facilities easily accessible from the Council chamber and lobbies.

CATHEDRAL SERIES.—CARLISLE: EXTERIOR OF CHOIR FROM SOUTH-WEST.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last in the premises at Tufton Street, Westminster, Mr. Louis Ambler presiding.

The CHAIRMAN proposed a vote of thanks to Mr. H. Whiteman Rising for presenting to the Architectural Association two plaster casts of heads designed for the War Office building by Mr. Alfred Drury, A.R.A.

Mr. JAMES S. GIBSON was selected as an ordinary member of the Council to fill the vacancy caused by the death of Mr. A. Maryon Watson.

Mr. A. N. PRENTICE read a paper on

Spanish Architecture.

To attempt to describe the glories of Spanish architecture would be a task too stupendous and quite impossible within the limits of a short essay such as this; moreover, long descriptions are tedious. I have, therefore, thought it might be of more practical interest to illustrate, with lantern slides, some of the buildings which we will presently discuss, and I propose to confine my remarks to that period of Spanish architecture which had its birth about the time of the expulsion of the Moors from Granada, a period during which architecture flourished with extraordinary grace and vigour, and finally developed into a more severe and dignified form under the patronage of Philip II.

In Spain the student has a great deal to see and to learn. The number of existing buildings is very considerable, and should he penetrate into some remote part of the Peninsula at the cost of a certain amount of personal inconvenience, he will probably be rewarded for his trouble by the joy of some fresh discovery. I well remember before my first visit to Spain receiving inspiration on viewing some large detail photographs shown to me by Mr. Phené Spiers, and that, being influenced by the originality of the style, I was led to visit the country. Views of a similar kind I hope to have the pleasure of bringing before you to-night. Before doing so, I will briefly sketch the architecture of Spain from a historical aspect.

Great nations have always expressed themselves in their architecture in a distinct fashion, and nowhere more so than in Spain do we find the genius of its people stamped on its architecture, an art which, more than any of the others, conveys a better idea of the manners, thoughts and daily life of the people. When we consider the situation of Spain, adjoining Africa, surrounded on three sides by great seas, and protected on the north by a rugged range of mountains, a land bathed in sunshine, with a plentiful supply of the finest building materials, it is not surprising that from the earliest times mighty nations have fought for its possession. The Romans, the Goths and the Moors were all great builders, and during the centuries they occupied the land in turn architecture had the scope for its development. It is not evident that the Phœnicians or Carthaginians practised building to any great extent, as few traces of their handiwork remain; but during the Roman occupation the whole country was covered with buildings of all kinds. The Emperor Augustus founded a great military capital at Merida, consisting of a collection of buildings typical of a great city in the days of the Roman Empire. Here we find the remains of amphitheatres, public houses, aqueducts, thermæ, villas and a well-preserved bridge of sixty-one arches crossing the Guadiana, half a mile long and 21 feet wide.

At Alcantara there is another celebrated Roman bridge, also worth going to Spain to see. It stems in giant strides a wild gorge of the Tagus. The structure is built of colossal granite stones, without the use of mortar, and it is composed of six arches, the two centre being the widest with a span of about 100 feet, and rising to a height of 150 feet above the river bed. A number of Roman aqueducts still exist in Spain, designed on the same large scale as their bridges. The best known examples are those of Segovia and Tarragona.

With regard to Moorish architecture, I need briefly mention that the Moors first set foot in Spain in A.D. 710. Their efforts in the north appear to have been confined chiefly to the erection of castles and strongholds, but it was in the more congenial climate of the south that they developed their fancies and architectural genius. They used the materials left by the Romans, and in many of the early buildings, such as the mosque at Cordova, we find beautiful capitals and columns borrowed from Roman temples. The fascinating beauties of the Alhambra and the Alcazar at Seville are so well known that I need not attempt any description, but I am desirous of emphasising

the point that the Moors occupied the Peninsula for upwards of 800 years, and that after the conquest of Granada their workmen carried on the Moorish tradition under their Christian masters in buildings of the Early Renaissance period. Nor will I attempt to trace the development of the Romanesque and Gothic periods. As in Italy, the Church became the great patron of the arts, and Spanish architecture during the Middle Ages was confined to cathedrals, churches and convents; besides, under the feudal system public edifices were not required, when the people were practically slaves. I could not do better than refer the student to the late George Edmund Street's book, which contains an exhaustive treatise on the work of this period. A curious phase of architecture during the reign of Ferdinand and Isabella was the introduction of the Mudéjar style. Spanish Gothic during the latter half of the fifteenth century had developed from the severe geometrical forms into a more plastic and decorative treatment. The technical dexterity of their sculptors had increased enormously, and with the contribution of the Moorish element the result was the production of a remarkable group of buildings, such as the façades of San Pablo and San Gregorio at Valladolid, San Juan de los Reyes at Toledo, the patio of the Infanta's palace at Guadalajara and many rich retablos and tombs. On the discovery of the New World Spain was in a position to undertake the production of costly works of art. About this time great events were happening in Europe. Italy, which towards the end of the fifteenth century began to thirst for a knowledge of the classics, had found in the volumes of the ancient classic writers an altogether new field of mental culture. Spaniards flocked to Italy to study at the universities, and they returned later to their own country enthusiastic pioneers in an altogether fresh interpretation of art. This, then, was the artistic atmosphere into which Spaniards emerged at the conquest of Granada; and the services of Italian artists were sought at a time when Christian churches had to be not only erected but furnished.

The invasion of the Peninsula by foreign artists was hailed with satisfaction by the Spaniards themselves, who had naturally a predilection for rich and realistic ornamentation. Spanish sculptors who had studied in the studios at Rome also took part in the movement. Many ecclesiastical princes of Spain, such as the Foncescas, Mendozas and others, became patrons of the new style, and sculptors and architects like Berruguete, Diego de Siloe, Enrique de Egas, Diego Riaño, and goldsmiths like Arphes, created the new style which was nicknamed "The Plateresque." The name seems to have been conveyed from the notion that its surface ornamentation and arabesques resembled the carefully chiselled work of the silversmiths. The rich effect of this style carried out by some of the early artists might almost be described as dazzling. It is almost a misnomer to call it by the title Renaissance. As I have just pointed out, this plastic treatment had already been adopted by the late Gothic artists and the new birth was simply a change into Classic detail of Gothic ornament. The practice of covering large spaces with the richest ornament was common to both styles.

CATHEDRALS AND CHURCHES.

Granada.

One of the first great works to be erected in the Plateresque style in the south of Spain was the cathedral of Granada. Enrique de Egas, who was first commissioned to design the building, prepared plans for a Gothic structure, but in 1525, for some unknown reason, the Chapter transferred the carrying out of the building to Diego de Siloe, who no doubt conceived the idea of transforming the Capilla Mayor into a circular form some 70 feet wide and surmounting it with a dome 155 feet high. The effect of this large open space immediately over the high altar is exceedingly grand and imposing. The plan of the interior shows a nave with double aisles, flanked with chapels, and a coro encroaching on the nave, as is the custom in all Spanish cathedrals. Massive pillars formed of four Corinthian pilasters placed back to back, surmounted by a sort of attic stage, rise from the floor of the church and support the vaulting about 100 feet high. Fergusson considers that in respect of its plan the cathedral of Granada is one of the finest churches in Europe. I regret I am not able to give a view of the interior of the dome, but its position can be seen at the end of the nave. The choir has some richly carved stalls, and the trascoro—that is, the back of the choir facing the west doorway—is adorned with rather late Renaissance detail, dating from 1741.

Façade.

The treatment of the west front is extremely massive and dignified, especially for a Spanish church of this period. It is said to have been designed by Alonso Cano about the year 1650. Previous to this the lower stage of the north tower was added, in the Doric style, by one of Diego de Siloe's pupils, who succeeded him on his death, and afterwards the second and third storeys were erected, between 1568 and 1589, by Ambrosio de Vico, to a height of 185 feet. He also finally added an octagonal lantern, but that was shortly afterwards removed as unsafe. The south tower was never built, and its position is occupied by the chapel of the Sagrario, built in the eighteenth century.

Capilla Real.

By far the most interesting chapel of the cathedral is the Capilla Real, completed by Enrique de Egas in 1515, in the late Gothic style. It must have formed part of his original scheme, and was perhaps one of the first parts of the cathedral ordered to be built, as a sort of burial-chapel for the Catholic kings. On the death of Ferdinand and Isabella the Italian sculptor, Domenico Fancelli, was summoned from Florence to execute the royal monuments. They are placed in the centre of the chapel, and are amongst the most magnificent mausoleums in Christendom. On the tomb to the right are placed the recumbent effigies of Ferdinand and Isabella, and on the left that of their daughter Juana and her husband Philip of Austria. They are both superb monuments, and are decorated with delicate ornaments and statuettes. On the tomb to the right the four doctors of the Church are placed at the corners, and the twelve Apostles at the sides, all executed in a soft-looking marble of a delicate cream colour. In front a few steps descend to the vaults, in which lie the plain leaden coffins of the Catholic kings. Behind is the magnificent iron *reja*, by the famous ironworker Bartolomé of Jaen, dividing the burial-chapel from the rest of the building. Sir Digby Wyatt refers to this in his book as the best in design and the most imposing of Spanish *rejas*. The screen was produced between the years 1520 and 1530, and bears the inscription, "Maestro Bartolomé me fec." I cannot do better than quote Mr. Starkie Gardner's description of this fine masterpiece. "It is divided into three storeys, diminishing in height from the base, by two massive-looking friezes, the lower embossed with medallions and figures, the upper with a honeysuckle border. The vertical bars between are twisted iron, breaking in the centres into leafwork and open tracery in two of the tiers, and into cherubim and foliage in the third. The pilasters of the upper tiers are finished with canopies and statuettes of the Apostles. Over the door is an immense panel, containing the arms of the royal personages within, with their supporting lions and eagles and other insignia and a profusion of angels. In addition to all this richness the cresting is extremely lofty; it is formed of tall candelabra, connected by the richest possible arabesques, which form canopies over a series of representations of scenes from the life of Christ, the figures being beaten in the round and almost half the size of life." The *reja* to the royal chapel at Granada, although extremely fine, is only one of a magnificent series of examples to be found in the great cathedrals and churches throughout Spain. The internal planning of the cathedrals lent itself most happily to the use of ironwork, and nothing like the richness and dexterity of these screens is to be found in other European countries.

Screens, Seville Cathedral.

I will now refer to the two great gilded screens in Seville Cathedral, of even surpassing grandeur. That of the coro was wrought by Sancho Muñoz, of Cuenca, in 1519, and was almost totally destroyed by the sad disaster to the building in 1899, when a portion of the vaulting fell in. The screen is 50 feet wide and must be upwards of 60 feet high. The central mass is of twisted bars with large Corinthian pillars at intervals, of wood construction, sheathed with embossed metalwork. A frieze of highly-decorated work, comprising the heads of five of the Apostles in medallions, is surmounted by a heavily-moulded and fretted cornice, and above all by a cresting, representing the Tree of Jesse, intermixed with figure and fine scrollwork, divided by towering candelabra. Francisco de Salamanca, a Dominican friar, designed the superb *reja* to the Capilla Mayor, which faces the screen just described, and was begun in 1518 and finished by his pupil, Antonio de Palencia, in 1533. Of purely Plateresque design, it has three tiers of spindled balusters, divided by pillars sheathed in iron. In addition to the finely-modelled frieze a low and

equally rich border intersects the screen, while the crest is a truly marvellous work. There is, in addition, a large panel forming a central feature, with a representation of Entombment in embossed iron, comprising many admirably designed and quaintly-costumed figures. The iron pulpit by Francisco are dwarfed into insignificance by the tower height of this colossal *reja*.

Malaga Cathedral.

Returning to the subject of other cathedrals built in the Renaissance movement, Diego de Siloe was commissioned to build Malaga Cathedral in 1538. The work progressed but slowly, and in 1680 the building was partially destroyed by an earthquake; but in 1719 the work was again resumed, and progressed at intervals. The interior is very similar in design to that of Granada, and is built entirely in white limestone. Here also the choir block the centre of the nave, but the general effect is very imposing. It will be noticed that the construction of the pillars follows the Granada example, with the exception of a slight variation in the height of the attic storey. There is a difference also in the decorative treatment of the vaulting, which in this case is a sort of palm-leaf ornamentation. Jaen Cathedral is an important work of this age, begun in 1532 by Pedro de Valdelvira on the site of a Gothic church. It has a fine west front, flanked by two towers 200 feet high. Underneath are three entrances, surmounted by reliefs and rich detail of a later period than the Plateresque.

San Domingo, Salamanca.

The south having led the way in introducing the Renaissance style into their churches, the clergy in the north soon followed their example. In Salamanca, Diego de Deza, Archbishop of Seville, and formerly tutor to Philip Juan (the only son of Ferdinand and Isabella), had already founded the church of San Esteban, commonly called Santo Domingo, to which he added a Renaissance facade thoroughly characteristic of the period. The cream-coloured stone is worked into saints, apostles and canopies separated by long, straight pilasters richly decorated with arabesques. The martyrdom of the patron saint occupies a large panel over the central doorway, and is by Antonio Ceroni, of Milan, bearing a date 1610. The medallions represent David, St. George and others. The frieze on the second tier is very finely carved in high relief, representing heads and cherubs, while yet above is a carved panel of the Crucifixion, flanked on both sides with beautiful canopies. A mighty arch resting on projecting buttresses encloses the whole, and acts as a sort of frame to this extremely imposing and decorative facade. On entering the church the choir over the doorway is occupied by the choir, supported by a wide elliptical arch. The practice of placing the choir over the west entrance is a peculiarity of Spanish planning, and seems to have been common to churches connected with monastic buildings, such as San Juan de los Reyes at Toledo, Santo Tomás at Avila, San Marcos at Leon, the Escorial and many other edifices. The cloisters of Santo Domingo are also in the Plateresque style, intermixed with Late Gothic in a peculiarly pleasing and tasteful manner. Within a stone's throw of this noble church, and facing its western facade, stands the new cathedral of Salamanca, begun in 1515 from the designs of Juan Gil de Hontañon, in the Late Gothic style, and which probably was not finished when the Escorial was commenced. I mention this facade as it is interesting to note that, although buildings with Classic detail were very much in favour after the middle of the fifteenth century, the Spaniards still loved the beautiful Gothic style, and continued to erect many other churches long after the cathedrals of Granada and Malaga were begun. Segovia Cathedral might be cited as an example. It is also the work of Gil de Hontañon who received the commission after he had started Salamanca Cathedral.

San Marcos, Leon.

However, the Renaissance movement continued to spread further north, and we find Plateresque features introduced into the lofty dome or lantern of Burgos Cathedral, which replaced the prior one which fell in 1533, and again at the convent of San Marcos, Leon, the masterpiece of the architect Juan de Badajoz. This convent, founded in 1168 for the knights of Santiago, was rebuilt in the Renaissance. The extensive building forms an apse, and is composed of the church to the east, the most interesting filling the rest of the space. The facade is decorated with pilasters and friezes of charming execution, and the rich festoons and delicate carvings are remarkable. In the

lower frieze are projecting busts in large medallions, and mythical figures. Owing to the change of residence of the Order the works were interrupted from 1566 to 1602, when the Order was re-established and the entrance to the principal façade was completed. Over the door is an effigy of Santiago on horseback.

Stalls.

The interior of the church is lofty, with late vaulting, having been disused for many years, is devoid of colour or decorations, save the beautiful stalls dating from 1541. The coro is elevated over the western doorway, and contains the richly carved stalls by Doncel which were made in 1721 and missing ones added. In the upper row are full-length figures from the New Testament, and in the lower row are busts from the Old Testament, while the seats and the stalls are grotesquely carved after the manner of Berruguete. During Charles V.'s reign many more stalls were added to in the Plateresque style, and it was only after his abdication, and under the rule of Philip II., that homage was paid to the cinque-cento style in its purest form. The plastic art seems to have lost favour, and ornamentation was eschewed.

Architects and sculptors returned from Rome under the influence of Michel Angelo and Vignola. The taste for the Plateresque sculpture changed into a more severe and classic style. This second period of the Renaissance is commonly known as the Herrera style, called after Juan de Herrera, the great architect of the Escorial. Herrera originally came from Belgium, and accompanied Charles V. throughout his campaigns in Italy, and was no doubt employed on military fortifications, as was the custom with architects of those days. On the emperor's return to Spain, Herrera came to work at the Alcazar at Toledo, but the Court was then settled at Valladolid, and the next important work entrusted to him was to prepare designs for Valladolid Cathedral.

Valladolid Cathedral.

Herrera recognised that he had a superb chance, and set to work to design an edifice which, in his own words, was to be a *todo sin igual*. The church had already been begun in 1527 by Riaño, and carried on by Hontañón and others, but Herrera formed new plans and destroyed what had been already built, with the intention of erecting a new edifice bearing the character of the new style which he had studied in Italy. He prepared a magnificent model, which is still preserved, showing a church consisting of a nave and choir, furnished with aisles and separated by a screen, and covered transept; both sides were to be flanked with a series of chapels, and there were to be four towers at the corners. The building, however, was but partially built, the only completed tower fell in 1841. The interior is 110 feet long and 207 feet wide, and although exceedingly simple is most impressive. It contains the original choir stalls designed by Herrera.

Valladolid Exterior.

The exterior is very impressive as seen from the narrow street leading up to the western façade, which is upwards of 70 feet high. The Doric treatment of the lower storey is extremely grand and simple, and the deep arch forming the entrance, 24 feet wide by 50 feet high, adds much to the whole. In the second stage of the façade are niches for the doctors of the Church, and the deeply recessed doorway is heavily moulded, but not by the hand of Herrera. After the lapse of a few years it was called by Philip II. to Madrid and appointed architect to the Escorial. It would seem that after the lapse of many years this façade was still completed by that fantastic artist with the unpronounceable name of Churriguerra. He added the balustrade with large escutcheons on either side of the square window, and other decorative details, and I should say also the corner balls and pyramids which appear rather clumsy. Herrera's brilliant idea of planning a large cathedral with a dome and four corner towers was adopted 100 years later, when the great church of the Pilar at Saragossa was begun by Herrera el Mozo, but unfortunately, as in the case of the Escorial, only one of the angle towers has been completed, and we have therefore to fall back on our imagination to realise what an exceptionally fine effect the four towers would add to the already picturesque appearance of this church seen from the banks of the Ebro.

Tower of Saragossa.

Towers were much in favour with the Spaniards. The Spaniards will find most beautiful examples throughout the length and breadth of the Peninsula. Every little parochial

church has its spire or tower; indeed there are few countries which can rival Spain in this respect. The famous tower of the Giralda at Seville is too well known to be included in my series of views, but I will give an illustration of the Torre Nueva at Saragossa, which, like the Seville example, is enriched externally with delicate Moorish traceries, formed in brickwork. It was erected in 1504 by Moorish workmen, and belongs to the Mudejar period. It leans some 10 feet out of the perpendicular, owing to the sinking of faulty foundations, and consequently a heavy brickwork casing was added to the base to insure its safety. But alas! this beautiful specimen no longer exists. A few years ago it was condemned by the local authorities as a dangerous structure, after the manner of county councils in our present day. When I first visited Saragossa, in 1890, this charming tower was intact, and on another occasion, two years later, when I visited the city with the late Mr. Heber Rimmer, we obtained permission from the Mayor of Saragossa to ascend to the top and inspect the construction. By that time the tall slated roof had been removed. The city engineer then had a theory that the heavy bells hung in the upper stage in some way added to its stability and counteracted the inclination.

The Escorial.

We now come to the Escorial, and after a brief description we will pass on to the civil architecture of the Plateresque period. Architectural taste at the present day is somewhat more in accord with the traditions which led to the production of this mighty building, and, if I mistake not, architects are more disposed to favourably criticise its design and construction. Few buildings of the importance of the Escorial have been more universally maligned by the general critic. It has not only been pronounced a failure, but also considered devoid of any artistic merit. Even the late Mr. George Edmund Street did not deem the Escorial worthy of a visit, as indeed, being a great revivalist, his sympathies were entirely opposed even to its consideration. He refers to the Escorial in the following terms:—"As far as the building is concerned it is enough to know that Herrera designed it, to be satisfied that it will be cold, insipid and formal in character, and the glimpses I had of it as I passed in the train amply justified this expectation." No doubt this vast structure, stripped of most of its furniture and ornamentations, and deserted by the thousands of people who formerly thronged its apartments, cloisters and courtyards, strikes the ordinary visitor as being most depressing, but to the architectural student the study of the structure should be of intense interest. The masterly way in which the building is executed, the jointing of the masonry, the manner of vaulting the large areas, the means of carrying water off the roofs, the underground vaults and finally the elaborate system of conduits and ducts for supplying the building with water, are all subjects worth investigating.

After a careful consideration of its purpose one can only come to the conclusion that the building has never been properly understood. The character and genius of its founder is stamped on every stone. Philip II., that stern but deeply pious monarch, who looked on the world with a mind tainted with melancholy, founded the Escorial as a temple, a cloister and a tomb, and not a pile built for ostentation and show. His object was to carry out the will of his father, Charles V., in constructing a royal burial-place, as a solemn act of gratitude to the patron saint St. Lawrence for securing him the victory at the battle of St. Quintin, on whose day it was fought. For about two years he searched for some spot in the vicinity of Madrid possessing the desired quality of solitude, and at last fixed on the wild, rocky and scantily-wooded slopes of the Guadarrama, a suitable frame and background for such a structure, which seems to form as it were a part of the landscape in which it is set.

The building forms a rectangle measuring about 680 feet long and 530 feet wide. On reading the many authorities on the subject one is perplexed at the great divergency of opinion in respect to its size. No two authorities seem to agree as to its height, length or breadth. I have therefore taken some trouble to prepare a plan, which I believe to be fairly correct, to a scale of $\frac{1}{8}$ -inch to a foot, with the hope that it will convey some idea of its vast proportions. As a plan I consider it one of the finest ever created by man, and well worthy to rank with that of the Baths of Caracalla or the Palace of Diocletian at Spalato, which latter it equals in general dimensions.

The architect first entrusted with the design was Juan

Bautista, of Toledo, who had studied in Naples and Rome, and was summoned by Philip in 1559 to prepare the plans. In 1563 the first stone was laid, and the building was pushed on rapidly till its completion, twenty-one years after, while the cost was probably equal to about 10,000,000*l.* of our money. Perhaps the true designer was Philip himself, who was a man of great and simple taste. Besides being a generous patron of the arts, he went into every detail most minutely, and criticised and often docked the designs submitted to him of all that seemed over-rich or too showy. He used to come frequently from Madrid to watch the progress from the summit of a hill close by. The characteristics of the Escorial are beautiful grouping of towers, large proportions, admirable harmony and simplicity of design, massiveness and grandeur. It is almost impossible to put one's finger on any detail and say it is out of place or unnecessary. In the centre is the church with its great dome and two western towers, facing the large internal court known as the Patio de los Reyes. To the right is the convent and to the left is the seminary; while the palace courtyard, a palace proper, lies to the east and north-east of the church. The interior is divided into many courts, from the centre of which rise two smaller towers with slated roofs. In addition to this, four massive square towers mark the angles of the building. The west and north sides have a fine paved lonja or platform and are flanked by extensive ranges of outbuildings, built at great cost to provide accommodation for strangers.

The block facing the western façade of the Escorial is called the Compañia, of which the most remarkable feature is a spacious cloister 200 feet square. The building is taken up with cells for lodging strangers of rank. The upper part contains an infirmary. In the lower part are shoe-wards and storehouses and large refectories, besides mills and granaries. The other range of houses on the north side to the left contains apartments for officers and servants attending the court. Each of these houses is divided into three interior courts, and adjoining is an elegant chapel for the spiritual advantage of those who live in the neighbouring buildings. On a closer inspection of the Escorial the windows appear small and devoid of any ornamentation, but they mostly light unimportant apartments ranged on the outer walls of the four great façades. Herrera probably considered the designing of the general mass of the building of more consequence than the grouping of the windows; besides, the heat of the summer and intense cold of the winter had to be considered. The main features are accentuated in an appropriate manner, and the Doric order is introduced to mark the centre of the western façade, and forms the main entrance to the court of the kings.

Shortly after the foundation-stone was laid Bautista de Toledo, the architect, died, and his pupil, Juan de Herrera, succeeded him. This no less eminent architect made numerous happy alterations, but without deviation from the original design to any great extent. He was also assisted by Antonio de Villacastin, and the building, rapidly progressing, was completed on September 13, 1584. On the same day of the same month Philip II. died here in 1598, having lived in this vast convent fourteen years. A dreadful conflagration happened in 1671. According to Francisco de los Santos it first began from so small a cause as a chimney taking fire, but the wind unfortunately carried the sparks to the roofs and the fire began and continued fifteen days without intermission, during which much of the structure, together with four grand towers, fell, but the church, the royal apartments, the principal library, together with many paintings and pieces of furniture, were saved. The whole was rebuilt with superior magnificence by Charles II., to be again divested of many of its treasures by the French during the Peninsular war. Other restorations followed, and the interior still contains many beautiful objects of interest.

(To be concluded.)

WINCHESTER CATHEDRAL.

THE Dean and Chapter of Winchester Cathedral have decided to carry out the recommendations of Mr. J. B. Colson, the cathedral architect and surveyor, for the treatment of the west front, as contained in the following report:—

The spires, which form such important features in the design of Edington's west front, and originally formed of Beer stone, received treatment at the same time as the whole of this façade underwent restoration about the middle of the last century. Originally constructed of Beer stone

wholly, portion of which presumably has been decayed the upper parts were pieced and patched with Caen stone and the cornice and pinnacles at the base and the finials were altogether renewed with this stone, and it is to the decay of the Caen stone that their present deplorable state is due.

Much of the original Beer stone remains on the sides of the slopes, and retains a true and weathered surface; the whole of the Caen stone is, however, much disintegrated and decayed.

The suggested treatment is that the whole of the Caen stone should be cut out, together with any decayed Beer stone, and replaced with a stone of more durable quality. This will entail the renewal of:—

(1) The battlemented cornice moulding at the base together with the shafts and crocketed portion of the pinnacles springing therefrom. (2) Probably about two-thirds of the angle stones running from base to spire. (3) The apex stone and finials to about 3 feet below the latter. (4) The ashlar of the slopes where found decayed and defective.

It is anticipated that the whole of this can be effected without taking down any excepting the extreme points, although cracks and fractures occur, these latter can be grouted in and cross-banded, and all made secure.

In the execution of the work the greatest care will have to be exercised in the cutting-out process, so as to insure that there shall be no undue weakening of the supports of the upper structure, and only small portions can therefore be executed at one time; all stones will be fixed in place by pebble or slate dowels, and the pinnacle points secured to the main structure by copper cramps. The weathered surface of the old stones that will be allowed to remain will be carefully preserved, and all the old Beer stone that is sound will be allowed to remain. The whole, when completed, should receive a treatment by sprayings and coatings of preservative composition such as is being used by the Professor Church at Westminster and other buildings in London.

The scaffolding has not yet been carried up around the central pinnacle on the west gable, but from what can be seen from the platform below it appears to be much in the same condition as the spires, *i.e.* partly composed of Beer and Caen stone, with much of the former and all the latter in a decayed state, the northern side being in this respect worse than the southern. It is anticipated that much the same treatment as recommended for the spires should be applied to this pinnacle.

Many of the string-courses and mouldings on the west front generally, whether of Beer or Caen stone, are now decayed on the surface, and some portions may require renewal.

As no structural defects are apparent, the general treatment recommended is that of the removal by brush of the eroded parts and a complete application of the preservative composition before mentioned. The process of the latter is laborious and expensive, as succeeding coats have to be applied by a spray and brush until the stone is impregnated to some depth with the solution; the cost, however, would be much less than that of new stonework.

LONDON COUNTY COUNCIL ARCHITECTS' DEPARTMENT.

THE necessity of reorganising the department of the architect, especially in the section of education has been recognised. In the latest report of the general purposes committee it is stated that the clerk of the Council in a report on the question, directs attention to the unsatisfactory manner in which the staff are accommodated in four buildings, which arrangement does not make for expedition, control or efficiency. He points out the apparently unnecessary subdivision of the department into a considerable number of sections, and comments on the arrangements which obtain for the execution of the work of structural alteration and repair, the cost of which approaches 200,000*l.* a year. The clerk of the Council strongly regrets that the whole staff should, if practicable, be concentrated in one building, and he calls attention to the difficulties which the present arrangements involve.

The clerk of the Council particularly calls attention to the repair work which is carried out at present partly by local contractors, partly by workmen directly employed under clerks of works engaged by the Council, and partly by the Council's works department, and he states that the

s by no means satisfied that the present arrangement is economical or trustworthy, inasmuch as it is entirely in the hands of officials who do not appear to him to possess the qualifications for initiating, controlling and certifying for this large amount of work.

For the purposes of repair the Council schools are grouped in twenty-two districts, each under the superintendence of a clerk of works for repairs, and in each district there are about twenty-five schools. The areas of these twenty-two districts are based upon the number of schools; they are not fixed geographically or in accordance with the boundaries of the electoral divisions or the London boroughs. A stock of the necessary materials is stored at the office of the clerk of works in each district, and in fourteen districts the Council employs a staff of 141 workmen to execute repairs up to the value of 15*l.* Works from 15*l.* to 50*l.* in estimated value in these districts, and all works up to 50*l.* in value in the remaining districts are executed by contractors. For structural alterations and other work exceeding 50*l.* in value competitive tenders are obtained from the selected list of contractors. An experiment is being carried out by which repairs to schools in six selected districts are executed by the Council's works manager without the intervention of a contractor. Small repairs to furniture are still being done by the Council's own workmen in connection with the repairs to school fittings under the supervision of the local clerk of works for repairs in each district.

For this repair work there are at present twenty-two clerks of works for repairs; of this number thirteen are on the established staff and receive salaries ranging from 50*l.* to 220*l.* 16*s.* 8*d.* a year; the remaining nine are on the unestablished staff and are in receipt of wages ranging from 3*l.* 10*s.* to 3*l.* 3*s.* a week.

The clerks of works inspect the school buildings and prepare draft orders and estimates for orders; they check accounts and measure up the work, but where the cost exceeds 5*l.* in measured work and 15*l.* in daywork, the measuring surveyor (Mr. Murray), who is in charge of a section of Mr. Bailey's department, undertakes the duty. The clerks of works also attend to serious urgent repairs; for instance, if a small fire occurred the clerk of works would prepare for and undertake the necessary repairs immediately after the fire.

Careful consideration of the present arrangements raises the question whether, now that the works committee are establishing in various parts of London local dépôts for works of repair, &c., it would be possible to arrange that a future all-repairing work should be undertaken by the works manager. This principle is being adopted by many committees of the Council, the chief reason being to secure that work done by one department of the Council shall be certified not by the same department but by another department.

From a careful consideration of the whole subject, it seems that there can be no question that reorganisation of the work is urgently called for, and the committee are unanimously of opinion that the first step to be taken is to place it as soon as possible under the architect of the Council, Mr. W. E. Riley. It has been suggested that it would be unreasonable to increase the heavy responsibilities which now devolve on Mr. Riley, and that the extent of the work in question requires that it should be dealt with by a separate staff. We have conferred on these points with Mr. Riley, who has pointed out to us that, although the work of his department under the Building Acts has greatly increased, so happens that the amount of constructional work, of working class dwellings and fire brigade stations, has substantially diminished, and the staff engaged on such work has been correspondingly reduced; and he has shown that it will be a comparatively easy matter to incorporate the staff of Mr. Bailey's department with his own, and to organise the work in such a way as will enable better results to be achieved.

Mr. Riley has prepared a report in which he outlines the reorganisation which he proposes to effect if the work is entrusted to him. He agrees with the clerk of the Council that Mr. Bailey's department is unnecessarily subdivided, and he suggests that the construction work falls naturally into three divisions—(a) elementary schools, (b) secondary schools, and (c) special schools. The projected capital expenditure during 1907-8 under these three heads is 200,000*l.*, 78,000*l.*, 27,000*l.* respectively; and the maintenance expenditure (structural alterations and repairs) during the same period is estimated at 110,000*l.*

Mr. Riley proposes to allot the work of elementary schools to the "special structure section," and he states

that even with this addition the section will not have in hand more work than has sometimes been in hand in connection with housing alone. To his general construction section, which, in addition to other buildings, has in the past dealt with technical schools and similar buildings projected by the late Technical Education Board, Mr. Riley proposes to allot either special schools or secondary schools. To the establishment and maintenance section of his department which has been responsible for fire brigade stations and for repairs and maintenance, Mr. Riley proposes to allot the repair and maintenance of school buildings and the execution of small structural repairs, with the addition of special or secondary schools as experience may lead him. The staff of the measuring surveyor's section can easily be amalgamated with that portion of Mr. Riley's staff now engaged on similar work.

Mr. Riley has made it a practice that such of his assistants as are engaged in designing buildings shall assist in the superintendence of their construction. A different practice appears to prevail in Mr. Bailey's department, in which the buildings have been designed in the office, whilst an outdoor staff superintends their erection. The committee have no hesitation in saying that they think the former method is the better, alike in the interests of the Council and its officers.

The general purposes committee therefore recommend:—
(a) That the office held by Mr. T. J. Bailey be abolished as from June 30, 1907. (b) That Mr. T. J. Bailey be informed that upon delivering his claim and statutory declaration, pursuant to Section 120 of the Local Government Act, 1888, the Council will forthwith take the same into consideration and assess the amount of compensation. (c) That the work now performed by Mr. T. J. Bailey be undertaken as from April 1, 1907, by Mr. W. E. Riley, the architect of the Council, and that the staff of the department of the architect (education) be transferred on that date to the department of the architect.

GUSTAVO GIOVANNONI AND CURVES IN PLAN IN THE TEMPLE AT CORI.

By WILLIAM A. GOODYEAR.

(Concluded from page 151.)

THIS is the proper point at which to close this paper, for it is not my purpose to explain these concave curves. As long as it appears certain that the facts now known are sufficient to compel new explanations, it seems hardly worth while to figure as a theoriser. It is mainly my wish to show that previous explanations of the Classic curves are insufficient to cover the facts now known. I may, however, add that Professor Giovannoni's announcement of the curves at Cori was made to the Roman Society of Architects in a report of a favourable nature regarding my own observations of Mediæval asymmetries and deflections. Therefore, I may add that the closest Mediæval analogy to the façade at Cori is that offered by the lower façade of St. Mark's at Venice, which curves concave to exterior from the foundations up, with a deflection of 10 inches at the foundations.

It appears improbable that the façade of St. Mark's was curved expressly for effects of concavity in the upper line, and especially so for the reason mentioned later in text that the cornice line appears to the eye to be built with slight obliquities rising from each end toward the centre, so as to correct the effect of concavity.

It is rather probable that the entire surface of the façade was considered. As regards line effects they would, below the level of the eye, produce the optical effect of rising curves in vertical planes. Above the level of the eye they would produce the optical effect of descending curves in vertical planes. These line effects are optically contradictory and therefore optically illusive. They must therefore give to the façade an effect of "life" or of optical mystery and vibration.

As regards views slanting along the façade of St. Mark's from left to right, or *vice versa*, the perspective effect is enlarged very considerably in the way of magnitude if the terminal upright lines rather than the upper horizontal lines be considered. But here again it appears more likely that an effect of optical mystery and vibration, rather than a direct increase of size in perspective, was considered. It may be that the varied effects of light and shadow which are involved in a curved surface were the dominant consideration.

As regards the façade of St. Mark's, it should be remem-

bered that only the lower façade is in question and not the upper façade, which stands back of a wide platform, bounded by the cornice of the lower façade. Although this cornice has not been levelled or plumbed, it appears to rise from the extremities toward the centre so as to correct the effect of concavity at the roof line. In the upper façade the pinnacles are arranged in descending heights from the centre towards the extremities.

In simple language, and aside from optical explanations, the façade of St. Mark's, in my opinion, gains vastly in artistic charm by its delicately and imperceptibly curvilinear surface, as well as by its subtle variations in the dimensions of the arcades. If Mediæval curves be admitted to have been constructed at all, it must be conceded that the lively effect of the curved line or surface was held to be superior to the rigidity and greater formalism of the straight or plane surface, and that no other universal explanation can be offered. Whether or no this lively effect is physiologically due to optical mystery, which is again due to an optical vibration between the contradictory optical effects which must always be found in delicately distorted architectural surfaces or lines, or whether it is due to varied effects of shadow, is hardly worth debating. It may be that both explanations have to be considered. I offer the suggestion for what it is worth, with the remark that the concave curve in plan at Cori demands some kind of explanation.

As regards the façade at Cori, we cannot assume that Mediæval curves would assist us to understand it unless two things be admitted, viz. the constructive intentional existence of certain Mediæval horizontal curves, and, second, the fact that they are historical survivals of the ancient curves. Both of these theories have been contested, and scepticism regarding them is very pronounced in some quarters. Therefore it is desirable not to diminish the incontestable and far-reaching importance of Professor Giovannoni's observations by laying too much stress on the analogies with Mediæval curves which are offered by the curve at Cori. For Classic art the discovery is certainly epoch-making, and for Mediæval studies of architectural refinements the discovery is, at least, far from disappointing.

If Mediæval analogies be excluded it is still evident that some explanation similar to those which have just been offered for them must now be sought for such ancient curves as are found at Cori. This involves further reference to the concave curves in the Parthenon and at Paestum, if for no other reason than the one that other experts than Hoffer have already been inclined to admit their constructive existence. Thus Reber (*"Kunstgeschichte des Alterthums,"* p. 207), a German authority of high standing, considers the concave curves of the Parthenon to be constructive. His explanation is significant for the fact that the optical effect, in front view, is that of a descending curve in a vertical plane, which equals the amount of the curve in plan at the angle of 45 deg., which decreases in amount from further points of view and which increases in amount on nearer approach. Reber holds that the concave curve was intended to contradict and decrease the excessive curve in elevation due to the combination of the optical perspective effect in elevation, on close approach, with the constructive curve in elevation. The interesting feature of this explanation (although it cannot be applied to Cori) is that it realises the two effects as being contradictory. Hauck quotes the explanation of Reber with tentative approval (pp. 109, 144, op. cit.) as an explanation, but expressly affirming the principle that the effects of a rising curve in elevation and of a concave curve in plan are contradictory, and that the optical effect of the concave curve is that of a descending curve in a vertical plane. It is of course understood, as Hauck points out, that the contradictory effect is insignificant and almost disappears from distant points of view. It would disappear entirely when the eye is on the level of the concave curve. Here the concave curve appears as a straight line. It is also understood, whereas the rising curve in elevation has its greatest relative effect from a distance, that the optical perspective curve is far the greater on close approach, so much so that on close approach the constructed curve in elevation is not an important addition to its amount. Neither Reber nor Hauck have considered the possibility that the concave curve might have been considered desirable for its effects from the slanting side view, and Hoffer is at a loss for any explanation.

Although the constructive facts in the Parthenon may be held to be doubtful, the above explanations are of value as showing the difficulties which have hitherto surrounded

the explanations of concave curves in plan, and also as showing that the effects of concave curves in plan above the level of the eye are recognised by optical experts as being those of descending curves in elevation for the front view.

The concave curves at Paestum do not appear to be exposed to suspicion on the score of constructive existence, and here again there are also rising curves in elevation at each end of the temple.

If either the Temple of Neptune concave curves or the Parthenon concave curves are admitted to be constructive, it must also be admitted that contradictory effects exist for certain points of view, and it remains to be debated whether the side effect was not the one which was considered for the concave curve.

For the Temple of Cori the question is not complicated by the existence of curves with contradictory effects, but it still remains to be debated whether the side effect was not considered as much as the front view. The Temple of Cori stands on a high elevation and the front view from below would on near approach much increase the optically descending effect toward the centre of the curve. For such points of view it could only be presumed that the curve was considered more agreeable than the straight line, without reference to the question whether it was a rising or a descending curve. For side view the effects would be optically contradictory as regards perspective; an effect of increase if the vertical terminal lines be considered, and an effect of decrease if the upper horizontal lines be considered.

It is a natural result of our interest in the surviving ancient monuments that we overlook their actually very small number and the enormous number of those which have utterly disappeared. The discovery at Cori makes it probable that curves were employed in ancient art to a much greater extent and in much greater variety than has hitherto been supposed.

In a paper which I published in the *Journal of the Archaeological Institute of America*, vol. vi. No. 2, new series (1902), "Architectural Refinements in Italian Churches," I discussed the optical effects of the cloister curves convex to the centre of the court at Verona and Bologna. I pointed out that the line effects were contradictory above and below the level of the eye inside the corridors, and that they were again contradictory, but in the reverse sense, as observed from the exterior. From this I argued that the curve must have been preferred for its own sake and independent of any definite particular perspective effect. It has since occurred to me that an effect of vibration, or of optical mystery in such curved lines or surfaces, must result from the shifting of the eye to different lines or planes of sight, or from the inclusion, at points more distant from the eye, of such contradictory effects within the limits of fixed vision in a single direction. In churches like S. Apollinare Nuovo at Ravenna, which have true parallel curves in plan in the alignment of columns, continuing in the walls of the clerestory, it is evident that the optical effects must be contradictory on the two sides of the nave, because the columns and wall surfaces are concave to the nave on one side and convex on the other.

In the Pisa Cathedral, moreover, where the gallery parapets are built in parallel curves in plan (which continue in the walls above) the same parapets also have constructive rising bends in elevation. (*Architectural Record*, vi. 4.)

Thus, from the pavement below the curve in plan increases the effect of the bend in elevation on the south side, where it is convex to the nave, and it decreases it on the north side, where it is concave to the nave. For the north side of the nave the facts are analogous to those in the Temple of Neptune at Paestum and in the Parthenon, where contradictory effects are found in the cornice. It may also be pointed out that, wholly aside from curves it has always been contended by the writer that effects of optical mystery were studied at Pisa. The explanation is offered for what it is worth, and any others would be equally satisfactory to the writer which cover all the constructive facts.

Finally, as regards relationship in feeling if not in continuity of historic practice, as between antiquity and the Byzantine Romanesque monuments of Italy, the authority of Jacob Burckhardt may be cited. Ernst Foerster, in his "Guide Book for Italy," was apparently the first to announce intentional irregularities of line in the Pisa Cathedral. He held them to be "die unbeholfensten Aeusserungen des romanischen Kunstgeistes." Jacob Burckhardt's footnote to the Leaning Tower in his "Cicerone" (in the first an-

second editions this footnote was subsequently removed from the text) quotes Foerster's idea as follows:—

"For the history of art Foerster's opinion about the relation of the Leaning Tower to the irregularities of measurement, oblique and bent lines, irregular intervals, &c., would be much more important [than his opinion about the tower itself]. In all these things he sees a dislike of mathematical regularity and of exact symmetry; these are said to be the clumsy expression of Romanesque endeavour" ("die unbeholfensten Aeusserungen romanischer Bestrebungen"). "Since we must unconditionally admit something of the kind in Greek temples, this view has something very attractive. I believe, however, that the given phenomena must be otherwise explained, and, namely, not by want of dexterity—which could not be suggested for the noble Pisan buildings—but by an inference to mathematical accuracy, which was peculiar to the earlier Middle Age."

Burckhardt then proceeds to give examples of this inference (which certainly also existed). The footnote just quoted inspired me to make a personal call on Jacob Burckhardt at Basel in 1870. I showed him the measurements and drawings which I had just brought from Pisa. He advised immediate publication, and professed his previous ignorance of the facts thus brought to his notice. Thus my own contact with Burckhardt shows that he was not familiar with the constructive facts at Pisa, whereas to him belongs the original suggestion that if the constructive facts exist they would be analogous in feeling to the deflections and asymmetries of Greek temples. (Burckhardt's matter on the Temple of Neptune at Paestum, to which he refers in this footnote, has been retained in later editions.) So Foerster, on the other hand, belongs the original suggestion that obliquities and bends were intentionally constructed at Pisa. He can hardly, however, have noted the true and delicate curves which are also found in the cathedral, for these can certainly not be called "unbeholfen" or clumsy.

As a final suggestion for façades like those of St. Mark's and Cori, it appears that the varying effects of light and shadow may have been the important consideration. Since these varying effects of light and shadow were notoriously studied with the greatest care in the profiles of Classic architecture, why may they not have been considered for the surface of the façade at Cori? The same explanation may be sufficient for the concave curves of Paestum and of the Parthenon.

THE TEMPLE LIBRARY OF NIPPUR.

IN the preface of vol. xx. of his "The Babylonian Expeditions of the University of Pennsylvania," which is just been published, Professor Herman V. Hilprecht, the Assyriologist of the University of Pennsylvania, for the first time explains his reasons for keeping secret all information as to the contents of the Temple Library of Nippur, which caused criticism in university circles two years ago, and ended with an official investigation of Dr. Hilprecht's discoveries and his justification at the hands of the university trustees. He gives as reason for his silence the perishable condition of the unbaked clay tablets has made it impossible for him to examine, classify and translate them as should be done.

Dr. Hilprecht, when asked by the New York *Evening Post* if the preface of his book is meant to be a reply to his many critics, replied:—

"No, no. Emphatically no. I have written from a purely scientific standpoint. I would not deign to notice the criticisms appearing in the newspapers. How could I? I do not know who my critics are. All that I have to say is the book. I write plainly. All can understand."

The preface to Dr. Hilprecht's book is in part as follows:—

The cuneiform texts here published form a very small part of a large collection of tablets and fragments once constituting the Temple Library of Nippur. In order not to give rise to any doubt as to the real meaning of my words, I emphatically state once more, I do not mean the Temple Archive, or the Temple School, or anything else but the Temple Library of Nippur. Enough of the cruel and unadvised advice received during the last two years in signed and unsigned American newspaper articles, journals, &c., to what should constitute an old Babylonian temple library, and what I should call the epoch-making discoveries of the University of Pennsylvania's expeditions to Nippur. I must resent it the more, as I happen to be the only

Assyriologist who (however hastily in many cases) has examined all the—more than 50,000—cuneiform inscriptions thus far excavated there, and who from its inception to the present day has been connected with this great scientific undertaking. What a Babylonian temple looks like, according to the facts furnished by the spade, and not according to more or less confused theories, I have attempted to set forth in chap. I of vol. xix., part I, "Model Texts and Exercises from the Temple School of Nippur." This chapter was written to form part of the present book; but finding that the new mathematical and chronological tablets here edited required a fuller discussion than originally planned, I was obliged to reserve it for the next volume, in which the Temple School and Temple Archive are treated in their relation to the Temple Library.

It is a very natural desire on the part of scholars to see published as early as possible what is left of the scientific and literary activity at the oldest and most renowned Babylonian sanctuary and seat of learning. At the same time, it is not my nor anyone's fault that the various results of our excavations could not have been submitted more rapidly to Assyriologists. All the members of the Babylonian Section of the University of Pennsylvania are taxed to the utmost with constant work on the material to appear in our expedition series. At the best a cuneiform volume is no novel which may be written from day to day. Before the rather pleasant task of "bookmaking" can begin the numerous fragments preserved in two museums, separated by more than 5,000 miles, must be cleaned, minutely examined, catalogued, divided into groups and subdivisions, and as far as possible joined to other pieces of the same tablet (often excavated at different times by different expeditions), that the scholar entrusted with the editing of a volume may receive his material properly prepared.

Peculiar circumstances arose which made my task even more exasperating. Towards the end of May 1900 the antiquities excavated by the fourth expedition and packed at Hilla under Haynes's personal supervision, were sealed and delivered to the representatives of the Ottoman Government at that place for shipment to Constantinople. The way around Arabia is long; numerous delays were unavoidable and frequent transfers of the precious material necessary. The boxes were often exposed to the inclemencies of the weather and roughly handled by inexperienced native workmen. Their Excellencies Hamdy and Halil Bey (to whom again I express my warmest appreciation of their continued interest and loyal support of our work) did everything in their power to secure the early arrival of the antiquities at the Imperial Museum; but more than a year elapsed before they were landed at their place of destination.

In 1901 I went twice to Constantinople, personally unpacking, examining and repacking more than 20,000 inscribed tablets and fragments within four months. A large portion of the Temple Library was presented by His Majesty the Sultan to the writer for his past services in connection with the organisation of the Imperial Ottoman Museum. It happened that large masses of antiquities from other excavations arrived in Constantinople that very year, while the magnificent third building of the Sultan's museum was still in course of construction. It was impossible to provide proper storage for all the boxes in the spacious cellars and vaults at the disposal of the authorities. Wooden sheds had to be erected in the courtyard of the museum to give temporary shelter to whatsoever could not find a place behind stone walls. The fall and winter rains of 1901 to 1902 were extremely severe, and these sheds proved a very insufficient protection for our own antiquities. Thoroughly wet and partly rotting, the boxes given to the writer arrived in Philadelphia in the summer of 1902 when he was absent in Germany.

Upon my return to Philadelphia, end of September, 1902, the antiquities received were presented to the board of trustees of the University of Pennsylvania, and a series of public lectures delivered, in which for the first time a summary of the history and scientific results achieved by all the Babylonian expeditions of the university were submitted to the numerous friends and supporters of this great undertaking. At my earliest opportunity I also opened some of the boxes from Constantinople. They were still so wet that their contents of unbaked inscribed clay threatened to be lost to science for ever. Energetic measures were necessary to save the broken remains of the Temple Library, destroyed by the Elamites, and 4,000 years later brought to light again by so much personal sacrifice on the part of the committee and the members of the expedition.

Accordingly, strict orders were given not to move or touch any of the tablet boxes (stored in a moderately heated large room of the museum), until the writer was satisfied that their contents had become hard enough to be handled with safety.

About two and a half months after my arrival I had to leave Philadelphia again (December 16, 1902) for Constantinople, where I spent over five months in 1903 (February and March, September to December) in cataloguing cuneiform texts, and assisting in the arranging of antiquities for the opening of the new museum building. On December 24, 1903, I was back in Philadelphia examining at once into the condition of the tablets left wet and soft in the previous year. Having convinced myself that the antiquities had been saved by the precautions taken, I commenced to catalogue the large number of tablets remaining from the previous expeditions, for until the present new archaeological museum of the university had been opened (end of 1899, when the writer was *en route* for Babylonia), there was no suitable place for cataloguing and storing the thousands of antiquities already obtained after the limited space temporarily assigned to the Babylonian section in the library building had been used. Many of the boxes then in our possession could not be opened at all; others, after a hasty examination of their contents, were repacked and stored with the rest in the cellar of the library building.

About 6,000-7,000 tablets and fragments have been catalogued by the writer in Philadelphia since January 1904; several other thousands of cuneiform texts in Constantinople during the same time. My impatient critics must not forget that, with all the well-known energy and enthusiasm displayed by the authorities of the British Museum, Sir Henry Rawlinson and his intelligent and hard-working assistants, nearly fifty years elapsed before Assyriologists could obtain a tolerably accurate idea of the contents of the beautifully inscribed baked fragments of the infinitely better preserved Library of Ashurbanapal! I plead for only ten years for my associates and myself to demonstrate the rich contents of the badly preserved fragments of the Temple Library of Nippur. Apart from the mathematical, meteorological and chronological specimens submitted in the following pages, and the first part on the Temple School, already in press, four more volumes on hymns and other religious Sumerian texts, syllabaries and lexicographical tablets, and the official correspondence between the Temple officers and the Babylonian kings are already in the course of preparation, to say nothing of four other volumes on dated documents, including the series on the Temple Archive recently successfully opened by Professor Clay.

The writer is only human, and cannot do more than devote his entire life and the strength left in him (after eighteen years of continuous hard work and frequent deprivations of the ordinary comforts of life in behalf of a scientific undertaking) to the resurrection of ancient Nippur. The power of every man has its limits set by nature, even when he is ably supported, as the editor finally is, by half a dozen enthusiastic pupils and associates in the great work of deciphering and publishing the results of the University of Pennsylvania Babylonian expeditions.

A.A.S.B.

SIR,—In your notice of the Architectural Association Sketch Book the remarks on the subject of the title-page might perhaps lead some to suppose that the building was designed by an Englishman, which would not appear to be correct. The Very Rev. James Moore, in answer to my inquiries, wrote that "It is after an Italian chapel which took the fancy of a rich family who inhabited this place over 100 years ago. An Italian architect, who drew designs for some beautiful buildings about Dublin, gave a sketch of the Italian ruined chapel, and after this model our ruin was built. The Cassel family used it as a summer-house for tea parties. It is now the entrance to our cemetery."

As to how closely it followed the original, and whether it could be called a design, I do not know.—Yours truly,

WILLIAM G. B. LEWIS.

28 Chatham Place, Hackney, N.E. : March 13, 1907.

GENERAL.

Mr. Reynolds-Stephens, sculptor, is engaged upon a large war memorial for the Cape, to be erected at East London. It is equestrian in form, being a mounted Afrikaner scout in the act of watching the enemy.

Mr. Edgar Dudley has been selected by the Local Government Board to serve as land agent for the western district in connection with the War Office.

Sir Ernest A. Waterlow, R.A., F.R.W.S., was elected president of the Royal Birmingham Society of Artists at their annual meeting on Saturday, in succession to Sir Aston Webb, R.A., whose term of office has expired. Three new Associates were elected, namely, Mr. Ernest A. Chadwick, Mr. Alfred Priest and Mr. E. K. Brice. The officers and professors were all re-elected. Mr. W. H. Bidlake, M.A., was elected deputy-treasurer.

The Royal Institute of the Architects of Ireland have decided, in view of the unsatisfactory manner in which most architectural competitions are advertised and assessed, that a simple code of rules suited to Irish circumstances should be drawn up and circulated amongst the practising architects and clerks of public bodies throughout Ireland.

The Birmingham City Council (baths and parks committee) were unable to come to a decision on the 8th inst. concerning the competitive drawings submitted for public baths for the Nechells district.

The North Riding county education committee have approved of the erection of a proposed new Council school at South Bank at a cost not exceeding 10% per head, and that competitive plans be invited from seven architects.

The Streets and buildings committee and sewerage committee of the York Corporation recommend that body not to advertise the vacant position of city surveyor, but to appoint Mr. F. W. Spurr, the deputy surveyor, for six months on probation at a salary at the rate of 300% per year. A proposal to advertise the post at 500% per year was discussed at considerable length, but was defeated.

Mr. A. Chevallier Tayler and Mr. W. Elmer Schofield have been elected members of the Royal Society of British Artists.

It is Proposed to offer to the University of Cambridge a replica of the statue, by Mr. Goscombe John, A.R.A., of the late Duke of Devonshire, Chancellor of the University. The Council of the Senate have resolved to propose a Grant for the acceptance of the statue if offered to the University. The sculptor has given his model, executed for the statue at Eastbourne, and the only money required is for casting it in bronze and for a marble pedestal.

Mr. George Watson, for many years architect and surveyor at Penrith, died last week. He was nearly eighty-three years of age. He was a keen archaeologist, and wrote much on Cumberland and Westmorland antiquarian and historical questions. He probably did more than anyone else to preserve the historical records of his district.

The Annual business meeting of the architectural section of the Royal Philosophical Society of Glasgow was held on Monday. Mr. Alexander Davie, honorary treasurer, reported that, with a balance carried forward of 190%, the income for the year was 223%, and that after meeting the expenses the funds on hand amounted to 200%. Mr. Alexander Gardner was elected president, Mr. Alex. Cullen and Mr. Samuel Smith were appointed vice-presidents, Mr. Robert Miller and Mr. Alexander Davie were re-elected honorary secretary and honorary treasurer respectively. Mr. R. Sandilands, the retiring president, was elected an honorary member of Council.

A Register is now being kept by the St. Pancras Borough Council of all buildings within its area which have historic interest, the necessary work being carried out by the historical records sub-committee.

Dr. J. J. Dobbie, director of the Royal Scottish Museum, in his annual report to the Department mentions that the windows in the south wall of the west wing of the museum have been fitted with iron shutters as a protection against fire. This cannot be regarded otherwise than as a temporary means of dealing with the grave danger to which Dr. Dobbie has already repeatedly drawn the attention of the Education Department. In his opinion nothing short of the removal of the buildings which immediately adjoin the museum on its south side, or their conversion to some less dangerous purpose than that for which they are now employed, can adequately provide for the safety of the museum.

THE WEEK.

WE lately spoke about the strange situation which the equestrian statue of JOAN OF ARC occupies in the city of Nancy. It was a gift of M. OSIRIS, the stranger who displayed so much munificence towards his country. In his will he announced that as he was not able to acquire the humble house in which the heroine was born, he desired that the statue should be removed from its present position, and that a more suitable site should be found for it in the centre of the city. M. OSIRIS also expressed the desire that the memorial should be surrounded by a screen of artistic character, and that every year, on the occasion of the fête of JOAN OF ARC, a crown of immortels should be placed in his name at the base of the statue. M. OSIRIS left the sum of 4,000*l.* to defray the necessary expenses. He also bequeathed a sum of 2,000*l.* for the erection of a chapel at Lausanne, which is to recall the patriotism of WILLIAM TELL, and a similar sum towards the erection of an Israelite temple. A sum of 4,000*l.* was left to the city of Paris for a memorial of Mdme. BOUCICAUT and the Baroness DE HIRSCH, who are to be represented as Goodness and Charity.

AFTER-DINNER speeches should not be criticised with too much severity. But men who hold responsible positions should on those occasions adopt the advice of placing a gate of prudence before their lips. The Mayor of Brighton, we believe, is a member of the medical profession, and any suggestion which he should offer about building is likely to be taken seriously. His Worship was the guest of the local Master Builders' Association on Monday, and informed them, according to report, that "they built too well. No house should be built to last more than twenty-five years. Tastes changed in a less period than that. A little while ago the ideal was a dignified edifice of many storeys and a basement. Now people wanted red bricks and smaller houses with more modern comforts. Builders might do more than they did in the way of modernising existing houses. People did not want basements; fill them up. They wanted smaller houses; cut off a storey or two." It is sometimes proposed that hospitals should be conflagrated periodically, as the only way to exterminate microbes, and ignorant people may imagine the Mayor was of opinion that a similar process is needed with dwellings, especially when they are let to a succession of lodgers. At present it is difficult to restrain the evasions of jerry-builders, and they may suppose that flimsiness is an aid to the promotion of the public health and adapt their houses for no more than a quarter of a century of existence.

FROM a report which was presented to the Glasgow School Board the accommodation in the schools is considerably in excess of the number of children who are of school age. Two causes have operated in producing this result. One is due to recent legislation, which raised the age of compulsory school attendance to fourteen, and in consequence an increase of accommodation had to be immediately provided all over the city. The other cause was in consequence of the tendency of the population to remove from the central part of the city. The change in the relative density of the population of the different districts made it necessary to have a rearrangement of the situations of the schools. Should the tendency continue it will be imperative for the Board to consider the advisability of closing some of the older schools in the Central, Gorbals and Anderston districts. By the new regulations rooms in the older schools are inadequate in size. The Board in anticipation of the future demands have been able to secure several sites in outlying districts. It is believed that although

any additional schools will not be required in the main part, provision for them will have to be made in outlying districts.

AILSA CRAIG is a familiar object to those who travel by sea from London to Leith or other of the northern ports. Rising to a height of 1,100 feet, and having a circumference of about two miles, its isolation makes it appear as a survivor of some great geological movement, which could overcome the hardest syenite. Many artists have made the islet a study, but not always with success. The rumour that Ailsa Craig was to be made the subject of a quarrying enterprise was therefore not heard with satisfaction. From the character of the stone, which is volcanic, it is not adapted for some purposes. What has been done is not likely to deprive the rock of its picturesqueness. A lease of thirty years has been entered into with Mr. WILSON, of Glasgow. Its operations will be confined to the south and south-east faces, and not more than fifty men are to be employed. A long time would be necessary before sufficient rock would be removed to make the solid mass of Ailsa Craig seem as deficient. It may even be believed that the operations will be advantageous, for there will be more opportunities for a play of light and shade.

FORTUNATELY for the world the United States make war on their neighbours only under exceptional circumstances. It is, however, necessary to keep up a military organisation. Those who attain rank in it, however, apply themselves to pursuits of a peaceful kind. And this fact is shown by the selection of Lieutenant-Colonel GEORGE W. GOETHALS for the post of chief engineer of the colossal works of the Panama Canal. He is no novice in hydraulic works, for he has been for several years connected with the improvement of rivers and harbours. A large section of the Tennessee river works was carried out under his direction. He also took a share in military operations during the Porto Rico campaign, and he has served as professor at the Military Academy. Colonel GOETHALS, as a reward for his services, was promoted to a place on the general staff. His duties as a member of the Isthmian Canal Commission will be onerous. But one lesson is afforded him by the failure of his civil predecessors, and for the honour of the Military Academy and the War Department he is bound to make efforts to bring the works to a conclusion without regard to difficulties.

A REPORT has been prepared by the Surveyor of Chichester on the old building in the Priory Park which is known and used as the Guildhall. Mr. LOBLEY says he cannot admit the building to be safe. But it has been in a similar condition for many years, and if not interfered with in any way might remain as it is. He considers that the west end of the building at least requires repair and underpinning. Apparently the hall is not creditable to Mediæval builders, for the Surveyor reports that the buttresses are ornamental rather than useful, and the foundations tend to overturn the walls rather than resist the push from the roof. The buttresses will have to be underpinned, and four steel tie-rods will be required to run across the hall at the tops of them. The materials of the roof could not be reused, and a new roof would be costly. Apart from the roof the repairs are estimated to cost between 300*l.* and 400*l.* And the Surveyor says:—"The suggested repairs are only from a utilitarian point of view, and would in no way add to the architectural beauty of the Guildhall. In dealing with such old buildings it is impossible to estimate with any real accuracy, but the work itemed cannot be done in a satisfactory manner at a lower cost. At the same time, it would be very easy to exceed the sum named, and in dealing with the building from an architectural point of view the difficulty would be to know where to stop, as so much requires doing." The City Council propose to borrow 500*l.* for five years.

ARTIFICIAL RUINS.

THE interesting letter from Mr. LEWIS which we published in our last number suggests a subject which at one time was closely connected with the practise of architecture in England. Indeed it might be said it was also connected with the two theories of gardening which alternately prevailed in this country, for it subserved the purpose of the artificial garden or the landscape garden. We refer to the creation of artificial ruins. Ireland is a country which unfortunately abounds in them. Remains of abbeys and churches, baronial castles and much else are to be found in most parts of the island. Yet in the eighteenth century we find a family who resided outside Dublin obtaining a design of an Italian chapel from an Italian artist in order to erect an ornamental ruin as well as a summer-house on their estate.

The selection of the artist is noteworthy. At the time there were English architects in Dublin who were erecting noble works in the Italian style, and yet the CASSEL family preferred to give the commission to an Italian. The reasons which determined the choice are unknown. But it may have been dictated by a belief that a foreigner's design for an Italian ruin was likely to be more satisfactory than one by CHAMBERS, GANDON, or COOLEY. The erection of ruins in gardens was really inspired by examples which were seen in Italy. The creators of Italian gardens, who in most cases were architects, were supposed to have had advantages in the possession of the genuine ruins of historic buildings which could be worked into their compositions, or in sites which recalled one or other classic work of literature. Italian paintings alone were also believed to present the true features of a beautiful landscape. When VANBRUGH declined to give a plan for the gardens at Blenheim, and recommended that a landscape-painter should be consulted, he was likely to be thinking of an Italian artist. A builder was supposed to be competent to plan and erect a town house. But for a country mansion it was suggested to the English gentleman that an *architetto-pittore* alone was competent to make the house adapted to the peculiarities of the scenery of the site. Tivoli was taken to be an example of what could be done by utilising the natural conditions. Every projecting rock or coign of vantage was occupied to advantage, and the buildings appeared to advance or retire according to their situation. If, said the opponents of Capability BROWN, a man could have existed among the ancient Romans resembling that innovator, his first step would have been to impart monotony to the place by removing rocks from one part and transporting them to another, on the principle of equalising practised in laying out cuttings and embankments on railways in later times.

That the power of utilising opportunities which characterised the architects of Tivoli continued to exist among the Italian architects in the eighteenth century is suggested by the practice of ANTONIO ZUCCHI. He was closely connected with the Brothers ADAM, and if he did not design at least decorated several of their buildings in England. In 1770 he was elected an Associate of the Royal Academy. He was also the second husband of ANGELICA KAUFFMANN, R.A. He is supposed to have been only a painter, but in Italy he was better known as an architect. An Englishman who was acquainted with him gave the following account of his practice:—"He was a great castle maker, and his mode of composing them was to draw first a bold and varied outline of the rock, mountain or eminence upon which his castle was to stand. He then, with according lines, added his castle; and you would be surprised to find how the imagination is assisted by this practice, and what towers, battlements and projections are suggested by it which would not otherwise have been thought of. I always observed that his building was more varied and picturesque in exact proportion to the taste and happiness with which the foundation-line was struck." Much else could be cited as evidence of a

belief among amateurs that for certain classes of structures which were to be set up in parks or gardens it was necessary to have recourse to Italians for designs, as the buildings would then appear to have been inspired by the site. One of the causes of the prejudice against works of the kind may be due to the fact that they owed their existence to foreign inspiration.

We see examples of the strength of this prejudice in Dr. JOHNSON. In 1774 he visited Hagley, where Lord LYTTLETON realised the new ideas about supplementary buildings in grounds and the creation of cascades to excess. He described the park as one artificial ruin. "He was enraged," says Mrs. PROZzi, "at artificial ruins and temporary cascades, so that I wonder at his leaving his opinion of them dubious; besides, he hated the LYTTLETONS, and would rejoice at an opportunity of insulting them." JOHNSON was no doubt a good hater. But there was in him much of the utilitarian of a later time. He could not see any advantage in the kind of adjuncts to an estate which were becoming fashionable, and he may have thought that if cascades were necessary nature would have created them. JOHNSON was, moreover, too prosaic to be able to realise the charm which such a building as has survived at Stowe, and which may be called a circular Classic temple in an unruined form, can confer upon grounds which are well laid out. WASHINGTON IRVING, coming from vast expanses of land which were to be found in America, was nearer the truth when he said that a rustic temple or a sylvan statue gave an air of classic sanctity to the seclusion of a great English park.

Another reason for the dislike to such buildings which arose among men like JOHNSON was that curiously compound character imparted to them in many instances. It is very hard to contrive a building which must pay a double debt, which shall be at once a summer-house for tea-parties and a ruined chapel like the Drumcondra example. It was believed in the latter part of the eighteenth century that landscape-paintings by Italian artists owed much of their attraction to the introduction of ruins rather than of buildings that could be inhabited. CLAUDE especially relied so much on his ruined towers, and RICHARD WILSON, who was the first important English landscapist, so faithfully followed his example, it was concluded that the picturesque was inseparable from decay. If an English gentleman wished to impart a sense of pathos to his grounds and to charm the eyes of sentimental people all that was necessary was to introduce ruins. By the same effort he improved his estate, pleased his friends, or at least the ladies among them, and exalted himself into a man of taste and sentimentality. Anyone who has seen the systematic series of ruins erected by the first Lord HOLLAND at Kingsgate, between Margate and Broadstairs, will be able to understand the peculiar influence which one class of men supposed such things were able to exercise. Fox was a strong-minded if not an unscrupulous politician at a time when corruption was tolerated. He attained the office of Paymaster-General and leader of the House of Commons. He purchased the votes of members on liberal terms, and in that way secured a majority in the House of Commons for his party, and gained a peerage for himself. Then, as GRAY, the poet, said, being abandoned by each venal friend, he formed "the pious resolution to smuggle a few years and try to mend a broken character and constitution." The place was dreary, but art was invoked to increase its dreariness:—

Here mould'ring fanes and battlements arise,
Turrets and arches nodding to their fall;
Unpeopled monast'ries delude our eyes,
And mimic desolation covers all.

If Lord HOLLAND wished people to imagine that he was or had become as unworldly as a Trappist, and that his thoughts were no longer occupied with parliamentary struggles, he deceived himself, for GRAY, no doubt, expressed a general sentiment when he suggested that

the ruins were typical of the destructive tendencies of his Lordship's mind, and expressed the form his revenge was to take:—

Purged by the sword, and purified by fire,
Then had we seen proud London's hated walls;
Owls would have hooted in St. Peter's choir,
And foxes stunk and litter'd in St. Paul's.

When structures which at Kingsgate, as in other places, were mere scenic decorations could be misinterpreted so easily, people must have hesitated before they set up imitations of old buildings.

It was supposed that the power of pleasing which ruins afforded was mainly derived from irregularity of surface. Whoever adopted them for the decoration of ground was therefore advised to let the breaks in them be as bold and abrupt as possible. If there were hills with sudden descents on the property, that dictated the employment of feudal castles. If there were fertile vales near wood and water, or if there was a spot abounding in large oaks, then nothing was more suitable than sham Gothic abbeys and religious houses. An occasional cottage, although a very inferior object, might be employed to suggest tranquillity. But whatever kind of building was introduced it must be placed in such a way that the eye would not tire in looking at it. Building must not balance building, but could be contrasted by a large oak. Whoever is curious concerning the subject will find many strange observations in the literature which appeared in the latter part of the eighteenth century.

The French Revolution and the wars which followed were unfavourable to the increase of sham castles and temples. People had to face realities which were troublesome, and land became valuable in proportion to its productive nature. Sir WALTER SCOTT was able to say with a sort of triumph that the mummery of temples and obelisks was abolished. And yet if by some fatality Melrose Abbey had been doomed to disappear, there is no doubt he would have purchased every stone that remained, and have re-erected them on some spot near Abbotsford, even if he had to write a special poem or novel in order to obtain the necessary funds. SCOTT loved buildings of an approved style in connection with gardens or estates as much as anyone, and he describes his enjoyment of a garden of seven or eight acres with no larger residence than a cottage, but which had "seats and trellis walks and a banqueting-house" as if the entertainment of friends was of primary importance to the owner.

Unless they were subjected to regular supervision garden-houses were likely to suffer from atmospheric influences far more than ordinary dwelling-houses. Rain might find its way through the roof of a Corinthian temple, and the absence of doors in some cases, although suggestive of welcome in summer, was a sure cause of dampness. Climate which was generally favourable to similar structures in the South played havoc with those in England. Decay therefore in some cases led to the removal of garden buildings, or, as in the Irish case, where the Italian chapel became the entrance to the cemetery, the structures which once were so pleasing within and without had to serve a different purpose and were utilised as tool-houses or stores for roots. The history of artificial ruins in England and of the buildings which were closely allied to ruins in the imagination of country folks is so melancholy that surviving examples would probably excite the pity rather than the rage of a JOHNSON.

Artificial ruins like those to be seen at Kingsgate are not likely to be imitated. Land has a pathos of its own which needs no increase. But not only enhancing effects can be produced by the aid of architecture, but utility can likewise be served. In so changeable a climate as ours shelters have their advantage, and casinos like those which CHAMBERS designed in the neighbourhood of Dublin, and which were sound solid structures in a Classical form, are much more rational

than an Italian church which is partly ruins and partly a tea-room. They would as well aid in suggesting the sanctity of seclusion as any mongrel structure for which a precedent was supposed to exist somewhere on the Continent. Such outlying buildings could easily be made to enlarge as it were the influence of the principal mansion. If the base of that building can appear extended by the arrangement of an architectural garden it can likewise be said that outlying buildings carry out that idea still further. It is advantageous in a painting to have a particular colour repeated, although the portions may in some cases be very small. And in the same way a mansion which, as WOTTON says, is to the possessors an epitome of the whole world, merits to be recalled throughout whatever area immediately appertains to it.

STREET WIDENING WITHOUT COMPENSATION.

IT is often a puzzle to determine on what principle the streets in the majority of towns in this country were laid out. There seems to be no doubt about indifference to the geometric definition of a straight line being the shortest distance between two points. That neglect might be overlooked if the crooked street were equal to all the traffic which passed through it. But generally it is found that the older a street is the more inadequate is its width. It is easy to point out a remedy, only the cost is usually supposed to be out of proportion to the advantages which are to arise. Compulsory sales are authorised by law in certain cases, but to seize on property for the benefit of the public without paying compensation is not sanctioned by any precedents, or at least by any which are modern. Corporations are therefore in a difficulty. They are expected to improve streets and roads, and are sure of abuse if they neglect that duty. Yet they rarely find an owner who is ready to sacrifice a strip of land or other property for the general good.

The attempt of the Glasgow Corporation to secure property for the widening of the streets without payment will therefore be considered by other authorities as ingenious and deserving of commendation. The judgment of the House of Lords, which was delivered last week, doomed it to failure, but nevertheless it was a courageous effort which in other towns would be certain of imitation if the result were different. The circumstances can be shortly described.

Strangers who visit Glasgow, although they may only remain for a few hours, are likely to become acquainted with Buchanan Street, which many consider to be Glasgow's principal street. The continuation of it at one end, although not in a direct line, is known as Port Dundas Road. It is a street which is far from being uniform in its architecture. It contains a station of the Caledonian Railway and several manufacturing concerns. Originally it was a turnpike road, and it came under an Act of 1793 which dictated that buildings were not to be erected within 40 feet of its centre. Very wide roads, on account of the expense of construction and upkeep, were not always approved by citizens, and Port Dundas Road became not more than 48 feet in width, although in some old plans attached to deeds the width is shown as 72 feet. That stipulation is worth remembering when judging of the action of the Corporation.

A couple of years ago some firms residing in Port Dundas Road applied for permission to enlarge their buildings. The Master of Works objected on the ground that the additions would project beyond the general building line. New plans were then prepared to meet his views. The Master of Works again opposed. This time he based his objection on the Glasgow Building Regulation Act of 1900, by which he was authorised to define the width of the streets. The width of Port Dundas Road he had fixed at 72 feet. In that way ground 12 feet wide which could be utilised by the

applicants became part of the street. There was an appeal to the Dean of Guild Court, which confirmed the action of the Master of Works. The case was next brought before the Court of Session, which for the occasion was strengthened by three additional judges, and their seven lordships decided in favour of the applicants. The Master of Works then appealed to the House of Lords, where the case was heard on October 25 of last year.

More consternation was, however, caused by the possibilities which were expected to arise under the Glasgow Building Regulation Act. The Master of Works was authorised by it to prepare a register of every street, showing the distance between the centre line and the properties on both sides of it. It was also to be supplemented by Ordnance maps on which the width of the streets, not as actually existing but as fixed at the discretion of the Master of Works, was to be coloured. In Glasgow, as in other towns, there was laxity in carrying out the regulations about streets, and owners and occupiers of property which they considered as standing on sites which were legally obtained found themselves in the position of squatters. Notices were given of appeals in between 5,000 and 6,000 cases. Among others, the Caledonian Railway Company discovered they were liable to have lines of rails and parts of their buildings appropriated, for they were comprised within the new street lines. They lost no time in taking an action. The conditions in their case differed from those of the applicants for authority to extend premises. The latter had an actual grievance, for they were refused permission to build. But no action had been as yet taken to the injury of the railway company or the thousands of citizens who entered appeals. All the company could plead was that their property appeared to be included within the limits of an ideal or imaginary street in a certain register belonging to the Corporation. The Glasgow Building Regulation Act allowed an appeal to the sheriff. The judges of the Court of Session considered that the action of the railway company was premature. But the company were eager to have the question settled at once by the highest authority, and, without regarding the sheriff, appealed to the House of Lords. Their case was heard on December 3, 1906. The points to be considered were so important the judgment of the House of Lords was not delivered until March 13. It is not necessary for us to enter at any length into some of the questions which were raised. We have simply to regard the two cases from the point of view which would be taken by an architect, engineer, or surveyor.

In the first place, it can be asserted that a street line or line of regular frontage is a comparatively modern creation. In terraces the architect would in most cases adopt a continuous line for his frontage. But there are few towns without evidence that the same line was not always adopted for properties which were raised at a later time. In such streets it is impossible to define a continuous centre line. If such a line is desirable it should be laid down before a building is commenced. When a street is irregularly built the actual centre will have to vary according as the frontages advance or recede from an imaginary line. As Lord JAMES said, the centre depends on the width between the houses at any point, and it is from the width the centre must be determined. But the Corporation lawyers argued that by law the central line was to be the line laid down by the Master of Works, and it would not be altered, although the street was widened on one side several feet and not on the other. The legal centre line was not to be discovered by the aid of any measurement with a tape, which drew from Lord ROBERTSON the remark that while measuring seemed to be suitable employment for a Master of Works, judicial decisions were hardly within his province. Another argument employed by counsel was that if the part of a building site which fell within the lines of a street which never existed were appropriated, it was an

advantage rather than otherwise to the owner, because he could then build a higher house. In a street 50 feet wide a man could only erect a building 75 feet high in Glasgow, but if the width were 60 feet, then the building could be 90 feet. The effect of that argument would be, the Lord Chancellor pointed out, that strips of a man's land could be obtained without paying for them, a method of dealing which was not recognised in the Act.

There is no doubt street improvements would be facilitated if the principle upheld by the Corporation could be established. Whenever premises which were affected by imaginary lines were to be enlarged or altered in any way, it would be easy to refuse permission until the applicant had come to terms with the Corporation. In London the widening of a thoroughfare bit by bit as leases expire is a costly process, and the results are for a long time unsightly, while in Glasgow owners would have to submit to confiscation, and there would be no use in rebelling. If the property of ordinary individuals alone had to be considered, the new process of acquiring might be overlooked. But to take a small part of a railway is recognised as a serious affair, because it may affect a long line of rails.

Courts of justice generally prefer to occupy themselves with realities rather than with abstractions, with substantial structures rather than with designs for them. The majority of the members of the tribunal of the House of Lords were likely to be acquainted with Port Dundas Road as it is at present and has been for many years. On that account they must have experienced a difficulty in trying to create its appearance in the future, when it would have a uniform width of 72 feet throughout its length. The decision given in the Court of Session was therefore confirmed, and we suppose no difficulty will be offered to the enlargement of the premises which gave rise to one action. The Caledonian Railway Company will have to apply to the sheriff for any relief they may seek. But as the ideal streets of the Master of Works are likely to be confined to the maps and plans of the street register, it is doubtful whether the company will have to surrender any of their property to give symmetry to a street, and the five or six thousand people who were in the same position will likewise be spared from disturbance.

ARCHITECTURE AND MUSIC.

THERE is no art which so fully and so extensively admits of the exhibition of passion and feeling in all their phases, from the simplest and mildest emotion to the most furious gusts of terror and anger, and hate and love, as does music. And these throes it serves to describe with animation and with vigour; it is also able efficiently to bring out, as it were, all the dark shadows by which their features are marked. Architecture also admits very fully of a character being given to its compositions, and of much expression and feeling, if not of passion, being exhibited in its designs. There is, moreover, a very great and, indeed, almost infinite variety of character in the different styles of architecture and in the several edifices which are erected according to its principles. Castles, cathedrals and palaces have each a peculiar and marked individual character of their own, which should be expressed in the style of their construction, and which corresponds with the purposes they are designed to serve. Solemn temples and courts of justice should, moreover, partake of the solidity which distinguishes the object for which they were raised; while, on the other hand, villas and places of entertainment may in their style be more lively and light. Regard should also be had in determining the character of an architectural edifice, not only to the actual object which the building is intended to serve, but also to the local position it is meant to occupy, both as regards the nature of the country about it and also the buildings which stand around it. And as temples to the Creator should vary much in their character and expression from halls of commerce, so buildings which stand on plains or near rivers should differ greatly from those erected on or near mountains or in great cities.

ST. MARGARET PATTENS CHURCH.*

THIS church is a rectory in the Ward of Billingsgate, situated at the south end of Rood Lane, the present paved court on its south side in Eastcheap having been the churchyard.

Rood Lane was formerly known, according to Stow, as St. Margaret Pattens Lane, "because of old times pattens were usually there made and sold; but of late time this is called Rood Lane, of a rood or cross there placed in the churchyard of St. Margaret, whilst the old church was taken down and again rebuilt, during which time oblations made to this rood were employed towards building the church."

St. Margaret, to whom the church was dedicated, was a

but there is a record of the parish in the will of John de Wyteby, dated 1275, which mentions his tenement in the parish of St. Margaret Pattens; Ralph de Coventry is mentioned in a deed dated 1305 as having been the rector, and he had his "antecessores;" and in 1324 Isabella Carpenter gave directions in her will that her body be buried "in cemeterio Sanctæ Margaretæ de Patyns." The advowson of the church was in 1324 in the family of the Nevils, Hamo de Chyrch having been collated thereto by them on June 14 in that year. The last presentment made by this family was by Lady Alice, widow of Sir John Nevil, Kt., on January 2, 1392. It then came into the hands of Robert Rikenden, of Essex, and Margaret his wife, who in 1420 transferred it, together with the manor of Leaden Hall, the appurtenances thereof and the advowson of St. Peter's, Cornhill, to Richard Whittington and other citizens of London, who conveyed the same to the Lord Mayor, aldermen and commonalty of the City of London in 1411. In 1424 the City made its first presentation, to William Gyles.

The old church was pulled down and rebuilt in 1538, and the rood above mentioned was set up in the churchyard, being "blessed and privileged by the Pope, with many indulgencies, for the pardon of the sins of those who came to pray before it and make their offering towards the rebuilding of the church."* Stow relates how "in this year (1538), about the 23rd of May in the morning, the said rood was found to have been in the night preceding (by people unknown) broken all to pieces, together with the tabernacle in which it had been placed."

The church was destroyed in the Great Fire of London in 1666 and the present edifice built in 1689—excepting, however, the tower and spire, which were not completed until 1745—from the designs of Sir Christopher Wren at a cost of 4,986*l.* 10*s.* 4*d.*

During the interval the services were held in a tabernacle erected in the churchyard of St. Gabriel Fenchurch, which had also been burnt down. Tabernacle Alley, leading into Fenchurch Street, still records by its name the circumstance. The church of St. Gabriel was situated in what is now Fen Court. A stream, known as the Langbourne, ran down Fenchurch Street, and the district was more or less a bog or fen, hence the name of the church. After the fire the two churches of St. Margaret Pattens and St. Gabriel Fenchurch were united by Act of Parliament, 22nd and 23rd of Charles II., the tithes being then valued at 120*l.*, increased in 1804 to 200*l.* The presentation

of St. Gabriel's belonged to the Priory of Trinity, Christchurch, within Aldgate, and at the Dissolution reverted to the Crown. Since the union of the two parishes the right of presentation to St. Margaret Pattens has been alternately with the Lord Chancellor and the Corporation of the City of London.

The church is Classic in its architectural design, and consists of a nave, chancel, north aisle, with gallery over, vestibule at the west end the full width of the nave, over which is a gallery containing the organ, and a tower surmounted with a spire at the north-west angle. The

ST. MARGARET PATTENS CHURCH.

holy virgin and martyr, born at Antioch, in Pisidia, her father being Ædesius, sometimes called Theodosius, a famous priest of the Gentiles. Olybrius, President of the East, being greatly enamoured of her beauty, desired her in marriage, but, finding she was a Christian, strove to turn her from her faith, and persuasion being of no avail he subjected her to most cruel and unheard-of tortures. These not prevailing, she was at last beheaded on August 30, A.D. 292, during the reign of the Emperor Diocletian.

The date of the building of the first church is unknown,

* A paper read by Mr. Frank E. Spiers before the members of the Woolwich Antiquarian Society.

* Northouck, *History of London*.

dimensions of the church are—length, 66 feet, width, 52 feet, and height 32 feet, the tower and spire being 215 feet. It is built partly of stone and partly brick, with stone quoins. The ceiling is flat, with a coved cornice which is groined to give space for circular windows. The groins spring from an architrave supported on three Corinthian columns with high bases on the north side and pilasters on the south, east and west walls. Between the pilasters are large windows. The east end is in three divisions, the centre recessed for the altar, the reredos consisting of two Corinthian columns of oak, with entablature and pediment, enclosing a fine piece of tapestry, on which is represented "The Supper at Emmaus." The carving

the church, and is quite worthy of notice; the cover is of later date. There is a good eagle lectern of carved oak.

The west end was formerly an open vestibule with rich carving over the doorway, and served as the baptistery. In 1745 the gallery with its organ was erected, afterwards being expanded to its present width during the rectorate of the Rev. H. J. Newbury (1804-66), who, being a popular preacher, attracted a large following. Other alterations were made by the late rector, the Rev. J. L. Fish, "at first," as he writes, "in face of much opposition, but, as time went on, with helpful forbearance and kindness." The reseating took place in 1880, the woodwork of the old pews being used for the purpose. The three-decker

over the high altar, of fruits, palms, foliage, &c., is exceedingly fine and is attributed to Grinling Gibbons. The walls of the church are wainscotted in oak 7 feet 6 inches high. Originally the church was fitted with large pews of oak, each seated on three sides, and there was a three-decker pulpit. The two churchwardens' pews at the west end still remain. They are canopied, and in one of them the initials of King James, "J. K.," and Sir Christopher Wren, "C. W.," with the date 1686, are inlaid. The fronts have delicately pierced panels carved in oak. The royal arms in front of the west gallery and the lion and unicorn on the churchwardens' pews are particularly well carved. The font, of white marble, carved with cherubs and foliage, supported on an octagon column of the same material, enriched with the acanthus, dates from the rebuilding of

vanished in 1886, leaving only the present pulpit, which is a very fine specimen of inlaid woodwork with carved panels. The two eastern bays of the aisle under the side gallery were partitioned off in 1890 to form a vestry, and at the same time the two western bays were fitted up as a side chapel, the reredos being formed out of the rich carving formerly in the vestibule over the doorway. It is surmounted with a valuable Luca Della Robbia plaque, representing the "Blessed Virgin worshipping Her Divine Child," presented to the church and placed there in 1899 to the memory of Thomas Wagstaffe, formerly a rector of the church, who was deprived for his loyalty in 1689. The sword-rest, of wrought iron, bears the Royal arms, those of the City of London, of Sir Peter Delmé, Lord Mayor in 1723, and of the Fishmongers' Company, of which he was

master, with their recognition of a noteworthy fisherman, St. Peter, viz. his cross keys thrice repeated. There is also another by its side of oak. Some good paintings are hanging in the church, viz. the one on the north side of the chancel, which was formerly over the high altar, representing "The Angels succouring Our Lord after His Temptation," by Carlo Maratti (died 1713); that near the font, which is a copy of Carravaggio's "Entombment of Christ" in the Vatican, given by Mr. Howard Gilliat; and the two hanging on the columns representing "The Angel Gabriel," given by Mr. Buttery, and "Our Lord bearing His Cross," given by the Duke de Moro.

Among the communion plate is a silver-gilt chalice dated 1521, a paten 1600, and two flagons, one given by Rev. Henry Lamb in 1708, and the other by Sir Henry Thorald, Kt. and alderman, in 1710.

The following are the chief monuments in the church:—Ægidius Vanderput, of Antwerp, died March 24, 1656, æt. 70, and Sarah, his wife, of Ipres, died 1666, æt. 67; their son, Peter, died 1668-9, and his wife, Jane, daughter of Theodore Horle, merchant, died 1672; and Sir Peter Vanderput, Kt., died April 24, 1708, who set up this monument in memory of his parents. Sir Peter, as sheriff of the City of London, stood on the scaffold on Tower Hill, with Bishop Ken, at the execution of the Duke of Monmouth. He gave 100*l.* to be laid out for the benefit of the poor of this parish.

Susanna Batson, daughter of Mr. Chaplin, a merchant in Rood Lane.

Sir Peter Delmé—according to Malcolm, the greatest merchant of his time—Lord Mayor of London in 1723, Governor of the Bank of England, and Master of the Fishmongers' Company, died September 4, 1728, æt. 61. This monument is the work of Rysbrack.

John Birch, many years an eminent surgeon in London, died February 13, 1815, æt. 69. He was a descendant of Willhelms de Bichis, who obtained the family arms—three fleur-de-lys argent on a field azure—for seizing the bridle of King John of France and making him a prisoner at the battle of Poitiers. He was afterwards appointed one of the knights in attendance on the king at the Savoy Palace.

Thomas Birch, D.D., rector 1746-66, historian and antiquary, at one time secretary to the Royal Society, of which he wrote a history; one of his best-known works is his "General Dictionary, Historical and Critical."

Mrs. Penelope Birch, spinster, and her sister, Ann, daughters of Dr. Thomas Birch.

The records of the church have been carefully preserved and are of great interest. They contain inventories dating from 1470, and throw a light upon the rich ornaments of the church of the time, including chalices, pyx, censers, chrismatory, reliquary set with stones and "a pece of the holy crosse within," an "imagine" of St. Katherine, a monstrance, altar cross, silver basins and a spygge (incense bowl). Also the "bokes," missals, breviaries, graduals, antiphones, ordinals, processionaries, psalters, hymners and manuals. A large stock of latens and pewter, copes, vestments, chasubles and the coverings of four altars, viz. the high altar, Our Lady's altar, St. Mary Mawdelyn's and St. John's, as well as banners and streamers.

The churchwardens' accounts date from 1508 and the registers from 1559.

Beside the authors mentioned, I have obtained valuable information from the following works:—W. Maitland's "History of London," R. Seymour's "Survey of London and Westminster," Newcourt's "Repertorium," Thos. Allen's "History and Antiquities of London," Geo. Godwin's "Churches of London," H. W. Clark's "City Churches," and "Notes" written by the late rector, Rev. J. L. Fish, in his "Parish Magazine."

SHEFFIELD SOCIETY OF ARCHITECTS.

AT the last meeting of the Sheffield Society of Architects and Surveyors Mr. C. F. Innocent lectured upon "The Architectural Treatment of Metalwork." Mr. W. C. Fenton (vice-president) was in the chair. The lecturer said the metals chiefly used by the builder were iron and lead, and both had been mined in this district from the beginning of the historic period. Evidences of the early working of lead and iron remain all over the neighbourhood, and in the Little Don Valley were slag heaps so old that all memory of their origin had been lost. Carvings of blacksmiths' tools on Saxon crosses, as at Leeds parish

church, showed that the tools were the same a thousand years ago as they are to-day. A Saxon carving at Halton of Regin forging a sword for Siegfried was probably the oldest illustration in England of a smith at work, and some of the tools were precisely the same as may be seen in use in Sheffield to-day. There is surprisingly little of old wrought ironwork in this district: the early seventeenth-century railings round the Scott tomb in Ecclesfield Church were an interesting example, and Mr. Innocent conjectured that they were designed by a Netherlander who had been to Venice. A great impetus was given to the designing of wrought ironwork by the arrival in this country of a great French smith, Jean Tijou, in 1670, who later did work at Chatsworth. The earliest use of cast-iron, architecturally, in the district appeared to be in fire-dogs; towards the middle of the eighteenth century the old open fireplaces were superseded by cast-iron stoves, and great numbers of these still exist in Sheffield; they are excellent examples of design appropriate to the material, and some of them appear to be by the celebrated Brothers Adam. Passing to lead, the lecturer alluded to the beautiful silvery appearance of old lead, which was due to its not having been desilverised as was now done. It was said that there was nothing new under the sun, and the Romans used also to desilverise the lead which they obtained in Derbyshire. Old lead was cast and not milled as modern lead, and the old plumbers took advantage of this to leave their names for the information of posterity, as may be seen upon the roofs of Sheffield parish church. On the old roof of Darnall Hall was the following:—

This lead was cast for

Mr. Samuel Staniforth as you may see 1723.

Also ye truth you may hear

This house was built in one year.

JOHN CLARKE PLUMER (sic).

And no doubt he plumed himself as much upon his verse as upon his plumbing. The lecturer pointed out that the designs in any material should always be appropriate to that material, and vary with the methods of manipulation. The lecture was illustrated by a large number of beautiful and interesting lantern slides.

At the conclusion a vote of thanks was accorded, on the proposition of Mr. C. F. Longden, seconded by Mr. W. J. Hall.

LICENSING IN AMERICA.

APPARENTLY there is a fair chance that, before long, the architects' license law will be pretty thoroughly tested in one State at least, says the *American Architect*, for besides the organised movement amongst San Francisco architects to test the constitutionality of the California statute, sporadic opportunities of getting the matter before a court seem to be springing up. Thus, last month, Mr. F. L. Soper, of Los Angeles, was haled into a police court for practising architecture without having taken out a license so to do. Naturally, his lawyer set up in his defence a plea that the license law was itself illegal, and so null and void. Amongst several points he makes in his plea is one that alleges that the statute nullifies itself, in that it excepts from prosecution those architects who take the trouble to notify their clients that they are practising their profession without having secured a certificate; another and, it seems to us, a probably stronger ground is the allegation that the statute is illegal because it confers upon the examining board an arbitrary power. It is interesting to know that the unfortunate architect was brought into court on the complaint of a revengeful contractor, and from this it can be inferred that spying, jealousy, revenge and all uncharitableness are to be found amongst the fruits of the thrice-blessed license laws.

The Glasgow University Court at their meeting last week considered a report presented by the committee on the proposed archæological lectureship. The committee recommended that Mr. Dalrymple's offer to provide the salary of a lecturer on archæology for five years should be accepted; that the course should consist of five or six lectures, to be delivered at the University at such time as may be arranged; that the appointment be in the hands of a body of curators, to consist of four to be appointed by the Court and three by the Council of the Archæological Society and Mr. Dalrymple during his lifetime. Although the arrangement was only for five years, it is believed Mr. Dalrymple will set aside money to make it perpetual.

NOTES AND COMMENTS.

THE necessity of a Government Commission to arrange the remaining watersheds of the country for the use of the towns which are likely to require them has been exemplified in a remarkable way in Harrogate. It was feared that Leeds would get hold of the source of supply, and the Council of Harrogate therefore sought for powers with immature plans and estimates. One false step in connection with construction is sure to lead to many others. We suppose it was owing to a knowledge of the character of the plans that instead of trusting the work to a contractor an effort was made to dispense with one. Authorities who believe in the economy of a works department would do well to consider the surprise which awaits the Harrogate ratepayers. Although much is said about the wonderful saving, especially in small matters, the Corporation are about to apply for authority to borrow 100,000*l.* to complete one of the reservoirs. The dam was to cost 15,000*l.*, while the actual cost was 26,308*l.* For the safety trench 1,995*l.* was supposed to be sufficient, but the outlay was 16,475*l.* The filling-in rose from 7,020*l.* to 33,180*l.* Masonry which was estimated at 44,950*l.* cost 71,506*l.* The increase on one part was no less than 89,127*l.* There was a difference of about 7,000*l.* between the estimate and the cost of a tunnel. The land for reservoirs was put down at 10,625*l.*, while the sum paid was 27,225*l.* It is supposed that the difference between the estimate and the expenditure amounts to 125,544*l.* 16*s.* The figures read like those of the London Works Department. Town councils should not be allowed to imitate railway companies and to become rivals, for losses fall on people who have no desire for competition. If the supply was convenient for Harrogate, then Leeds should not be allowed to use its wealth in order to monopolise the ground. It must also be admitted that even eagerness to secure a source of supply did not warrant a procedure which has become so costly to the people of Harrogate.

FROM the report of the United States Consul-General the German cement makers appear to have been more successful last year than in 1905. The joint-stock capital of thirty large works, representing approximately 22,000,000 *dols.*, yielded, roughly estimated, from 2,300,000 *dols.* to 2,500,000 *dols.* interest, or 10.7 to 11.4 per cent. In the year 1905 the dividend amounted to about 8.5 per cent., calculated on a capital of 21,200,000 *dols.* Dividends of the companies in question in the last eight years, 1899-1906, were as follows:—14.3, 11.25, 5.24, 4.41, 5.14, 6.58, 8.5 and 10.7 to 11.4 per cent. respectively. The reason for this favourable development was chiefly the building activity throughout the country in 1906. Although during 1904 and 1905 a similar activity prevailed, prices suffered in those years from the consequences of over-production. Notwithstanding the fact that in 1905 such an over-production did not make itself felt so much as in the preceding year, the production during the year 1906, although a number of new works were put in operation, did not in general exceed in a marked degree the demand. This supposition is confirmed by the statistics of the imports of cement during the last year.

BURNTISLAND parish church is interesting from its massive piers. Prior to 1822 they were adorned in colour with designs and the lettering of the Commandments, LORD'S Prayer, Creed and Beatitudes. On the front of the galleries were emblazoned the emblems of the trades or guilds of those who possessed the pews—hammermen, sailors, weavers, tailors, shoemakers, fleshers, bakers, &c. Most of the ornamentation has been obliterated by encrustations of paint and varnish,

though some parts are still dimly visible. A proposal of a member of the congregation to restore, as far as possible the original appearance of the interior has been approved, and Sir R. ROWAND ANDERSON has undertaken the direction. He is not sanguine of success in restoring the insignia on the galleries, but expects to bring the pillars to something like their original appearance. The oak-panelled magistrates' seat, with the date 1606, is still used, as in the past, for the "kirkin" of the Council.

WE mentioned last week the proposal to have the main drainage works at Clontarf carried out by direct labour under the direction of the officers of the Dublin Corporation. It was, however, premised that the cost was not to exceed the amount of the tender of Messrs. BINNS, of Croydon. On further consideration the onerous nature of the task which for amateurs seemed so easy became apparent. It was recalled that the cost of laying water pipes was 16*s.* 7*d.* per lineal yard by the Corporation labourers, while a contractor had offered to carry out the work for 5*s.* per yard, or less than a third of the sum expended. Then it had to be recognised that the Corporation did not possess the plant which was indispensable for extensive drainage works, and if it were purchased it would have, whenever the works were completed, to be sold at a sacrifice or to remain as an incubus in the yards. The consulting engineer declared that direct labour would be more expensive than contractors' work. Besides, there was a possibility of a law-suit for delay by the residents of Clontarf. Eventually twenty-eight members voted for handing over the work to Messrs. BINNS, who should have obtained it in the first instance, while sixteen voted for extravagant direct labour. Dublin is a favourable place for any system where money can be wasted, and when we find the supporters of direct labour have failed it may be taken as a sign that the bubble has burst.

NEW SESSIONS HOUSE, OLD BAILEY, E.C.—ELECTROLIER ON FIRST FLOOR, CENTRAL HALL—DETAIL OF DOORWAY—REFRESHMENT-ROOM.

ANNFIELD PLAIN PUBLIC LIBRARY.—FIRST PREMIATED DESIGN.

THIS design was submitted in the competition for the above by Mr. EDWARD CRATNEY, of the firm of DAVIDSON & CRATNEY, 50 Grainger Street, Newcastle-on-Tyne, and 22 Fawcett Street, Sunderland. The plan is simple and straightforward, and was set out with the view to working it with as small a staff as possible. The principal rooms are grouped around the entrance-hall, which gives access to all parts. The public counter is so placed that the librarian whilst at work has a view of all the doors to the main rooms, and he has also complete control over the news-room and reference-room, with a service counter to the latter. The staff-room and lavatory are placed in the basement, which also contains stores and heating chamber. The elevation will be built of local stone, taken from the quarry at the rear of the site. The more important joinery to be in oak of simple detail, and the floor will be of maple-wood blocks. The entrance-hall and lobby will be paved with 6-inch by 6-inch black and white "dull" tiles. The windows will be filled with lead glazing set in wood frames and painted white. The building will be heated by low-pressure hot water. Tenders have been received and the work is to be proceeded with shortly.

CATHEDRAL SERIES.—CARLISLE: EXTERIOR FROM SOUTH EAST.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. Leonard Stokes, vice-president, in the chair.

Mr. Henry T. Hare, F.R.I.B.A., and Mr. J. Duff Brown, chief librarian, Islington Public Libraries, read papers on

Libraries.

Mr. J. DUFF BROWN, treating of library planning as affected by modern library policy and interior arrangements, and discussing the question of finance, lamented the fact that the English Libraries Acts do not specify the amount which shall be borrowed for building purposes, as in the case of the Scotch Acts, which provide that only one-fourth part of the income from the library rate, capitalised at twenty years' purchase, shall be borrowed, thus putting a definite check upon the mistakes and extravagances of committees. In most cases throughout England this reasonable proportion of the library rate has been enormously exceeded, with the result that many of the buildings possess architectural merits, but as libraries are failures. The craze for over-building, because the money is easily obtained, has been responsible for numerous cases of library buildings which are collections of bricks rather than of books, and whose equipment is so meagre and funds so scarce, that the hours have to be shortened in order to avoid a gas bill which would extinguish the penny rate.

The author went on to consider the following points, which he put forward as suggestions for discussion:—Is it advisable in the interests of progress and efficiency to standardise library plans and methods by adopting one uniform system for everything? The author hoped that the factors which were being sought to bring about this uniformity would never be discovered, and that architects would continue to design and librarians to invent fresh solutions of every problem presented. Systematic classification, by introducing more scientific methods of arrangement, will necessitate some alteration in the structure and pacing of book-shelves. Exact classification has brought about changes in the height, spacing and adjustability of book-cases, and has had some influence in bringing into use the "open-access" system, which the author predicts will within the next few years become all but universal. The "open-access" system has been the means of important modifications in planning. In both reference and lending departments the book-cases must be easily accessible from the floor without the use of steps, and the pacing of standard book-cases when facing each other must be arranged so that readers can stand back to back at the shelves and still leave sufficient gangway for others to pass. This extra space is very nearly balanced by throwing into the room the lobby usually reserved in front of indicators and similar closed systems. If the library is periodically freed of obsolete books, congestion only arises in a few cases and for a brief period. The best shelving for a public library is the homes of the borrowers, and for that reason elaborate efforts to find accommodation for books which are generally in circulation is a mistake.

Another department in which great changes are certain to happen is the reference library. Its function in the past has been to collect books rather than to utilise them for purposes of research; it has become rather a book museum than a literary workshop. The author advocated complete isolation for students in the reference library, so that everyone should have a reserved self-contained place at a table, with plenty of accommodation for spare books and table space sufficient for the arrangement and spreading-out of reference works and papers.

Another matter which may influence planning is the question of limiting the supply of newspapers. Many libraries have cut down the supply. In some the provision is limited to the exhibition of the "situations vacant" columns cut from the morning paper; in one place newspapers are not taken at all. By limiting newspapers considerable economy is effected in the cost of space, stands and fittings, lighting, staff, &c.

Mr. HARE said that the public library had been the occasion for many competitions, and it might have been expected that, with so much effort concentrated on a comparatively simple subject, some very brilliant type of plan or design would have been evolved. This, however, had not been the case, for none could claim to be the last word in library design. If the problem were dealt with from the initiatory stage (*i.e.* the selection of the site) under proper advice a much better result might in most cases be attained. Often in a library for a moderate-sized district accommoda-

tion was asked for twenty or thirty thousand books in the lending department. This needed a very large room, and was quite unnecessary. A large proportion of the books, particularly fiction, quickly go out of date. Shelving for ten to fifteen thousand volumes would generally be sufficient for an average district; it might be supplemented by an adequate store-room, where books could be economically housed. The reference library also is often over-sized: for an average library accommodation for from twenty to thirty readers is ample. The bulk of the books might be housed in a stack-room adjoining the reference-room. The usual treatment of the reading-room is susceptible of much improvement. The ideal reading-room should partake more of the nature of a hall, with probably an open roof, or at all events considerable height. It should permit of the spacing of the furniture very widely, allowing ample gangway for persons to move about without disturbing the readers.

The author suggested that the lending library might be included in the reading-room, so reducing the typical library to two main public rooms, *viz.* a general reading-room and library, and a smaller room for reference readers opening out of it. This arrangement would obviate the necessity for passages, entrance-halls and staircases and all available funds could be devoted to those parts of the building actually used by the public. The author touched on the "open access" and "indicator" systems, and showed the manner in which the adoption of either the one or the other must influence the design of the building. The necessity for the supervision of the lending library in all its parts from a central fixed point appeared to suggest as the ideal plan for this room a semicircular form with radiating book-cases. On confined and irregular sites such a plan, however, is very difficult, if not quite impossible. The importance of supervision by the staff should not be exaggerated as the public using the library largely supervise themselves.

A recent development in the direction of rendering libraries more widely useful as educational centres, where lectures can be given, has introduced a new element in the planning, separate entrances and exits having to be provided. From this point of view it is open to question whether the familiar news-room, with its costly fittings, is really a necessity. In the new libraries being built in Islington no newspaper-room is being provided, but only a large general reading-room containing magazines and periodicals.

The author, in conclusion, urged the desirability of re-considering our views of the necessities of a public library in the direction of a much more simple type of building, *viz.* one large hall with very ample space both in floor area and cubic capacity. This would be economical, comfortable and convenient, and would lend itself also to dignified architectural treatment—the latter of the first importance from an educational point of view.

Mr. MAURICE B. ADAMS, in proposing a vote of thanks to the authors, said he was in entire sympathy with both papers and the observations brought forward. As he had read a paper himself on the same subject, he fully realised how difficult it was to say anything fresh with regard to libraries. There seemed to be a discrepancy between the two speakers. Mr. Hare wished to simplify and co-ordinate the planning of libraries, and Mr. Brown urged that such buildings should not be made similar, but adapted always to the localities they served. He sympathised with many of Mr. Brown's views, and agreed with the opinion that the space given up to newspapers in public libraries could be minimised. The newspapers had deteriorated so deplorably during the past few years that the majority of them could be dispensed with, and he doubted whether they exercised the influence they used to do on public feeling. Realise just for a moment, said Mr. Adams, the condition of the newspaper Press in London at the present time. The Government had an enormous majority in Parliament, and yet they were not able to maintain one decent penny paper. In regard to open access to books in libraries he again agreed with Mr. Brown. He happened to see a number of replies which were obtained by the St. Pancras library committee from all parts of the kingdom as to the advantages of such a system. The librarians in an overwhelming majority were against it, which surprised him because, with several others interested in libraries, he had long been advocating the advantages of free access. The public, he thought, did not require so much supervision as was often suggested as the possibility of being seen at any moment. People in libraries generally behaved themselves and, provided the arrange-

ment of space allowed of easy superintendence, their conduct was always good. With regard to similarity of plan, he did not see how the two papers could agree, for if one remembered that sites were often different, it would then be seen that it was impossible to have the buildings alike. As to the success of Mr. Hare's own buildings, the speaker could speak from personal experience, since in some examples he had been one of the competitors when Mr. Hare gained the award, and he realised how admirably the conditions had been fulfilled. Mr. Adams said there was often difficulty in the heating of libraries. Radiators occupied valuable wall space and were not cleanly; he had found the open fire was generally the most satisfactory.

Mr. E. A. BAKER, librarian of Eltham library, seconded the vote of thanks, and in commenting on the papers said Mr. Brown had distinguished himself among librarians by the completeness in which he had worked out his buildings, and more especially by reviving the open access system and the recent experiment of abolishing newspapers. The speaker used the words "revived the open access" because after all it was not a modern idea; at all events, they knew that some such system was in force in libraries 100 years ago. With the inauguration of municipal libraries there had been considerable difficulties in knowing how to administer large groups of readers, and librarians no doubt concluded that it was best to adopt the closed system, thereby keeping the books under control. It was curious that there should have been great hostility to the open access system, but he thought it was largely due to the natural inertia of librarians who were in charge, and the great inconvenience of converting existing closed libraries into ones of free access. The speaker believed that the problem for architects in the future would be to make this conversion in buildings not so administered. Mr. Hare's library at Islington the speaker cited as an example which embodied the best and most modern ideas in arrangement, combined with economy in construction and artistic effect.

Mr. R. J. ANGEL said he would be glad if Mr. Brown could tell the meeting his experience with regard to the theft and loss of books from libraries conducted on the open access system. Reference had been made to the delay which was occasioned in filling up forms of requisition for books and the indicator system. He ventured to suggest that a long counter with several indicators each accommodating its own class of books, and in the charge of an assistant, was a satisfactory method by which the public could be readily served. One good reason why the British Museum system could not be copied was that the conditions of municipal libraries were different. It was much more difficult to become a member of the British Museum library than of a local one, and there could not therefore be the same control in the latter case. In concluding his remarks the speaker wished to learn whether any libraries conducted on the open access system had changed in favour of the closed control.

Mr. R. A. PEDDIE said it had struck him that the library at North Islington was the result of the happy combination of architect and librarian. It was only occasionally that a library was planned under such conditions. Sometimes the building of a library was undertaken before the librarian had been appointed, but the speaker thought that unless the architect had had considerable experience of the wants from a librarian's point of view, there would be something lacking in the plan. He suggested that wherever possible architect and librarian should consult together. The general consensus of opinion was, he believed, in favour of open access, though the system could be modified to suit the conditions of a locality.

Mr. A. J. PHILIP said the questions of open access and the abolishing of the news-room were subjects tabooed at the meeting of the Librarians' Association. They must still regard such questions in the light of experiments.

Mr. E. GODFREY PAGE said the real objection to the open access was due to the carelessness which the public showed in replacing books in their right cases.

Mr. FRANCIS HOOPER suggested that open access was a matter which might be commended to the Council of the Institute with regard to their own library.

Mr. F. J. OSBORNE SMITH and Mr. H. V. LANCHESTER also made remarks.

Mr. J. FROWDE said the whole discussion had revolved almost entirely on one point, and that the most uninteresting in library construction. He was not quite sure that the consultation between architect and librarian would result in satisfactory planning. Some librarians could not direct or advise, and for that reason an architect with knowledge and

experience would be able to produce independently a good plan. Mr. Frowde was a defender of the closed system in libraries. He could remember that the privileges of open access were abused at Liverpool and the system had to be withdrawn. The loss of books by the open access system was a well-known fact. He wished architects to remember that there was a very great difference of opinion regarding the two systems.

Mr. BROWN, in his reply, said the loss of books under the open access system was insignificant, and he believed no municipal library in this country had abandoned the open access in favour of the closed system.

Mr. HARE said the difference in cost between the two methods was not so important as the consideration of the great question which system was the most useful.

ARCHITECTS' BENEVOLENT SOCIETY.

THE annual general meeting of the above Society was held in the rooms of the Royal Institute of British Architects at Conduit Street on Friday, the 15th inst. Mr. J. Macvicar Anderson acted as chairman on the occasion, in the absence through illness of the president of the Society, Mr. T. E. Colcutt.

The Honorary Secretary read the report, from which the following is an extract:—

"The Council of the Architects' Benevolent Society in presenting their fifty-sixth annual report have the pleasure to record a year of increased prosperity and usefulness. Many new names have been added to the subscription list, and the capital account has benefited both from donations and bequests. This favourable result is largely due to the letter of appeal which the president (Mr. T. E. Colcutt) issued towards the end of the year to over 5,000 architects. The thanks of the Society are due to the President for his exertions in this matter, by which the sum of over 100*l.* has been added to the annual income and 175*l.* to the capital account. If the appeal had not been issued, the income would have been insufficient to meet the demands made upon it. Notwithstanding the success of the President's appeal the number of subscribers on the Society's books is still very small compared with the number of practising architects.

"It is satisfactory to learn that the allied Societies are taking an increased interest in our labours. Mr. J. T. Cackett, in his presidential address to the Northern Architectural Association at Newcastle-upon-Tyne, stated that there was no better way to help our less fortunate brethren than through this Society, and he believed that the amount granted to recipients in the northern province exceeded the subscriptions derived by the Society from the district. He also alluded to the fact that their past-president, Mr. Glover, was now a vice-president of the Society.

"Eighty applications for relief were received during the year, and the sum of 743*l.* 12*s.* 6*d.* was distributed in seventy-five grants. In addition to this, the sum of 183*l.* 1*s.* was paid to pensioners, thus making the total amount expended in relief 927*l.* 7*s.* 6*d.*"

In moving that the report and statement of accounts be adopted, the Chairman said that he considered them on the whole satisfactory, and there was cause for congratulation, but he urged the necessity of every architect supporting the Institution. The motion having been carried unanimously, a vote of thanks was proposed to the retiring members of the Council, viz. Messrs. Rowland Plumbé, G. T. Hine, Ambrose M. Poynter, Mr. W. Grellier and Colonel R. W. Edis. This was seconded and carried unanimously.

The next business was the election of the Council for the ensuing year, as follows:—Mr. T. E. Colcutt (president), Mr. H. T. Hare (vice-president), Mr. H. L. Florence, Mr. G. B. Bulmer, Mr. F. W. Hunt, Mr. W. L. Spiers, Mr. A. Ashbridge, Mr. Walter Emden, Mr. Reginald St. A. Roumieu, Mr. H. Chatfield Clarke, Mr. A. Saxon Snell, Sir H. Tanner, Mr. E. T. Hall, Mr. J. T. Christopher, Mr. L. W. Ridge and Mr. J. Douglass Mathews.

Votes of thanks were unanimously passed in favour of the hon. treasurer, Mr. W. Hilton Nash, and the hon. secretary, Mr. Percivall Currey, for their services during the past year; and they were both re-elected for the ensuing year. A vote of thanks was also tendered to the retiring auditors, Mr. Sydney Perks and Mr. E. Greenop.

For the ensuing year Messrs. Greenop and Burk Downing were elected to serve in that capacity.

The resolution adopted at the last annual meeting follows was confirmed:—

"That the following be inserted after by-law No. 7 and be numbered by-law No. 8:—Allied societies and corporate bodies representing architecture who are now or may become annual subscribers of not less than ten guineas, or donors in one sum of not less than fifty guineas, shall be entitled to be represented on the Council by their president or chairman for the time being, who may also vote at all general meetings, and shall be entitled on behalf of his Society to the same privileges as those of individual donors or subscribers." And to renumber consecutively the subsequent by-laws. To move that after the words "hon. secretary" in by-law No. 9 the following be added:—"And the president or chairman for the time being of societies or corporate bodies who have qualified under by-law No. 8."

The proceedings concluded with a vote of thanks to the Royal Institute of British Architects for the use of their rooms, and to Mr. Macvicar Anderson for acting as chairman.

THE EFFECT OF FIRE UPON VARIOUS BUILDING MATERIALS AND FORMS OF CONSTRUCTION.*

WHEN I first set this subject to occupy our attention this evening, it was my intention to take the fire tests of the British Fire Prevention Committee as examples of the behaviour under fire of the various materials used in building, but I recently had forwarded to me an excellent report, with illustrations, of the San Francisco conflagration, prepared by the consulting engineer of the Roëbling Construction Company, New York, Mr. A. L. A. Hummelwright, C.E., who has kindly given me permission to use his report and photographs to illustrate my paper to-night, to whom I publicly tender my thanks. My paper, therefore, will be of more practical interest as showing from actual examples, rather than from the test before mentioned, the behaviour of the materials under the fire test.

I am also under obligation to Mr. S. Albert Reed, consulting engineer to the National Board of Underwriters, who has also issued an interesting report, which I have utilised.

My thanks are also due to Mr. Sydney Gamble, of the London Fire Brigade, for the loan of some panoramic slides, giving an excellent general view of the devastation wrought, and also to the British Fire Prevention Committee for photographs and other details of interest.

As you will perhaps recollect, the fire at San Francisco was consequent upon the earthquake.

On April 14, 1906, at 5.15 A.M., the main shock occurred, followed by subsequent minor shocks. Buildings with walls of masonry and brick sustained considerable damage, chimneys, parapets, gable walls and cornices were overthrown.

This being a region subject to earthquakes, a large number of the buildings, especially the residential portion, were of the wood frame type.

There were, however, a number of buildings of ordinary construction, and others again of steel-frame construction, which were intended to be fire-resisting, and it is to this latter class to which I wish more particularly to draw your attention this evening, as showing the effect of the fire on the various materials used, but at the same time it will be interesting to note the effects of the earthquake.

Soon after the main earthquake shock numerous fires occurred in the city. These were occasioned in most cases by the collapse of the buildings, and were most of them in the business section.

The fire department although efficient, and who to some extent had anticipated such a calamity, had the misfortune to lose its chief, he being injured in the earthquake by the collapse of the station in which he was sleeping, and who subsequently died, but the most serious factor in fighting the fire was the want of water caused by the breaking of the water mains by the earthquake shock, and it soon became apparent that a conflagration of great magnitude had started.

For three days and two nights the fire raged with incredible fury, destroying practically the entire business and financial section of the city, where the largest, costliest and most substantial buildings were located.

The area devastated by the fire was about 2,831 acres, or 4.11 square miles. I want you to mark these figures, as we

are seeing to-night the effects of the largest fire in modern times, if indeed of any time, which throws that of London, Chicago, Baltimore and Boston altogether in the shade, and I think it has for architects some useful lessons.

Of the general run of the buildings little is to be learned; they burned, collapsed, and there was an end of them, and so complete was their destruction that every scrap of combustible material was entirely consumed and blown away as ash, leaving scarce a trace behind.

But there were in certain parts of the city buildings having more or less pretensions to be fire-resisting, and these may be divided up into three types:—

I. Buildings with brick or stone walls carrying floors of fire-resisting construction.

II. Steel-frame buildings with reinforced concrete floors and fire-resisting partitions.

III. Steel-frame buildings with hollow tile floors and partitions.

It is my intention to show you specimens of each of these three types of construction, but it will perhaps be interesting first to note the results of the earthquake which preceded the fire, and also the effects of the fire upon a few of the ordinary types of building, viz. those having brick walls, cast or wrought-iron columns, steel or iron beams supporting deal joists and wood floors, a type of building described in the by-laws as Class B buildings.

Lessons to Architects.

It will be observed in the examples which we have seen that there have been certain good points and certain bad ones or omissions, which, if they had been anticipated, would have in some cases enabled the buildings in question, if not to have come out unscathed, at least to have withstood the ordeal without material damage.

It is by adopting the good, discarding the bad, and supplying the omissions that it should be possible in the future to plan and erect a building which should be actually fire resisting, not only in the mere shell, as we have seen, but with all its internal fixtures and fittings preserved, as it is not much satisfaction to the individual tenant to be told the building remains when perhaps his little all is entirely consumed.

Judging by the number of steel-frame buildings which have survived, so far as their shells are concerned, I think it is demonstrated that the steel skeleton frame is satisfactory, provided its individual members are sufficiently protected.

The glaring omission to protect the exterior openings was the direct and sole cause of the damage and destruction of the interiors in most cases. This is further emphasised by the fact that other buildings, of much less pretension to be fire resisting, have remained undamaged by reason of their window openings having some such protection as wired glass, steel shutters, or other form of fire resistant properly applied.

I would therefore sum up my observations by inculcating the following lessons:—

I. *Protect the openings against fire from the outside.*

This, to my mind, is the most important lesson, and is the key to the position. You will have observed in the views presented that the flames were communicated to the so-called fire-resisting buildings from the outside through the windows and doors. There are now available practical devices to safeguard such openings which may be adapted to the varied circumstances of each case.

II. *Adequate protection to columns and other structural members.*

You will have noted how utterly in some cases the column protection failed, and in others how it succeeded in keeping the ironwork sufficiently under a certain temperature to prevent buckling; both hollow tile and metal lath-and-plaster protection seemed to have been wanting when any long-sustained heat had to be endured. I am inclined to the opinion that concrete filled in solidly all round the column right up to the web is the best protection, but whatever it is it must be securely anchored to the column, and there must be no voids, and if brick or tile is used it must be backed up with good concrete or cement mortar filling up entirely the space, and no pipes must be hidden in the protection, as their expansion may endanger the casing, which in its turn will imperil the safety of the building.

III. *Avoid as much as possible the use of refractory materials for façades.*

It will have been seen that granite, marble, sandstone, limestone and similar building stones proved unsatisfactory materials for architectural effects. This, however, will be

* A paper read before the Society of Architects by Mr. Ellis Marsland, hon. secretary, on Thursday, March 14.

no argument against their use, for being deprived of these materials what is an architect to do?

Yet, knowing their inadequate fire resistance and the better fire resistance of all clay products, it behoves him to bear the fact in mind and avoid stone where damage might ensue by its employment for columns and piers carrying important points of support.

IV. *Select a good type of floor construction.*

It will have been seen that the hollow tiled floor construction failed in many cases by the expansion of the soffit causing it to split off and expose the cellular spaces. By a better construction of the tile this may be avoided in future, but the showing in the examples before us to-night has been more favourable to the reinforced concrete, and if this is executed in some form of "cinder" concrete or broken brick and the reinforcement well protected on the soffit by at least 2 inches of material, I am inclined to pin my faith to that.

V. *Adopt partitions that do not expand.*

The hollow-tile partitions in the cases before us have not shown up very favourably. The reason is that when heated a large amount of expansion takes place, and bulging and eventual collapse is the consequence.

The metal lath-and-plaster partitions were also failures, and we are led to fall back upon some form of reinforced concrete or concrete slabs, the thickness varying in accordance with their height. I am inclined to see in this material more satisfactory results.

These, gentlemen, are the principal points I want to emphasise; there are other minor ones with which I will not detain you now, as I have already exceeded my time, for which I must apologise, as the subject has been to me a fascinating one.

SPANISH ARCHITECTURE.*

(Concluded from last week.)

PASSING through the great atrium, or Patio de los Reyes, the church is entered by a large vaulted vestibule, formed under the choir. The wide flat vaulting is most skilfully executed, and is a triumph of stone construction. Philip II. was most doubtful of its solidity and ordered a central pillar to be added, but Herrera persuaded him to abandon the idea. The inside of the church is really majestic in its simplicity as seen from this vaulted chamber. There is nothing mean or trivial to mar the perfect proportions of this fine interior. Facing us is the Capilla Mayor, containing the high altar, the oratories and the royal tombs. The retablo of the high altar is superb, and is reached by a flight of steps in red marble, steeper than was intended, but built to afford space for a cupola under it for the pantheon. The screen is 93 feet high by 43 feet wide, of the four Orders, and is composed of red granite, precious jaspers and gilt bronze. It is the work of Giacomo Trezzo, of Milan. The tabernacle was designed by Herrera and executed by the above artist, who finished it in seven years. Beautiful paintings fill the spaces between the columns, and at the sides are niches with statues in gilt bronze. The vaulted roof was originally stuccoed white and dotted with blue stars. In the reign of Charles II., when the Escorial was restored after the fire, its compartments were painted *al fresco* by Giordano.

The Choir.

The choir, or coro alto as it is called, is placed over the western entrance of the building and looks down on the church, and it is here that the monks assembled for their devotions, in which Philip often joined. His seat was in the south-west corner adjoining a small doorway, through which a messenger passed bearing the news of the victory over the Turks at the battle of Lepanto. On receiving the news Philip is said not to have moved a muscle of his face, and continued his devotions as if nothing had happened. The simple but dignified choir stalls were designed by Herrera, and are made out of ebony, cedar, box, or other choice woods. The Corinthian order is introduced, and there are some good carvings on the priors' stalls. The large lectern was a present from Charles II. It is Classical in style and bears an eagle with spread wings, carrying in its beak the gridiron, emblematical of the martyrdom of St. Lawrence. The beautiful crystal chandelier was also a gift of the same monarch.

The arrangements and every detail of the choir are excellent. The organ was the finest that could be got,

while the walls are decorated with frescoes representing the martyrdom of San Lorenzo, and the history of St. Jerome, the head of the order. The choir is provided with ante-coros, and there is also a large library where the colossal choral books are kept, some of them being 2 yards wide. Finally, the gem of the choir is the full-size white marble crucifix, by Benvenuto Cellini, a present from the Duke of Tuscany to Philip II.

The Library.

As Philip II. intended to make the Escorial a treasure house of all the arts as well as a seminary for the study of the sciences and ancient letters, it was fitting that a magnificent library should form part of the collection. This noble apartment, about 170 feet long by 31 feet wide, is placed above the main entrance to the Patio de los Reyes. The pavement is marble, and the bookcases were designed by Herrera, made of ebony, cedar and orange. Most of the books are bound in black or dark purple leather, and have their edges, not backs, turned to the spectator. In all there are about 56,000 volumes. On account of the well-chosen position of the library, lighting is introduced on both sides and in the middle are five large jasper tables, with smaller ones in porphyry, for the use of readers; while above all is an arched ceiling adorned with frescoes, with subject personifying the sciences and arts.

Court of the Evangelists.

Of the fifteen courtyards contained within the four walls of the Escorial, the patio of the Evangelists, a court 150 feet square, is the largest and most beautiful. Few courtyards in Italy can rival it for grace and beauty of Classic proportion. It has four façades, composed of two rows of pillars, columns and arches, making a total height of 60 feet. The first row is of the Doric order, that above of the Ionic. They are equal in their proportions, which are taken from that of a man and answers to 6 feet in height. Santos says:—"The height of the arches from the balustrade is 20 feet and the width 10 feet. Both stages have large green lattices up to the springing of the arches and glass windows over them, which besides sheltering the cloisters from the rigours of the winter, preserve the frescoes which adorn the inner walls of both upper and lower cloisters. Within the body of the cloister is a delightful garden divided into sixteen areas, twelve of which were filled with flowers and curious plants and decorated with knots, labyrinths and other devices, displaying the most vivid colours in a continual bloom, so that during the most severe winter weather they constantly furnished the altars with a profusion of flowers. The remaining four squares are occupied by water ponds lined with rich marbles. In the centre of all is an octagonal cymborium, 30 feet in diameter and 60 feet high. The outside is of beautiful stone, and the architecture of the Doric order. Within, it is inlaid with jaspers and marbles of the richest kind. It has four entrances, answering to the two walks which cross each other in the centre. On the sides are niches, and in them the statues of the four Evangelists by Bautista Monegro, and in front of them their attributes—the angel, the eagle, the lion and the ox—placed near a jasper balustrade, whence the water issues into the ponds."

Time will not permit me to give any further description of the Escorial, nor of this beautiful courtyard with the sacristy to the east, the chapter-houses to the south, the old church and the grand central staircase to the west, but mention should be made of the pantheon situated under the high altar, the final resting-place of all the kings of Spain and the primary object of the erection of the whole building. Philip II. prepared nothing but a plain vault as a tomb-house for his father. His simple idea seems more appropriate than the work completed and carried out by his successors, who have undoubtedly spoiled the effect by overloading the chamber with marble and gold. Since 1385 the buildings have passed into the hands of a religious order who carry on the education of youths in the seminary to the north-west of the entrance.

Charles V.'s Palace at the Alhambra.

Previous to the erection of the Escorial there were few royal palaces in Spain, with the exception perhaps of the Alcazar at Toledo and the castle of Segovia. The Emperor Charles V. was a great soldier, and was much occupied abroad in wars with Italy and with Francis I., consequently he had little time for palace-building. It is true he gave instructions for a palatial addition to be built to the Alhambra at Granada, but this was abandoned and left unfinished a few years afterwards. It was begun as early

* A paper read at the meeting of the Architectural Association by Mr. A. N. Prentice on Friday, March 8.

as 1526 by a Spanish architect named Pedro Machuca, who had studied in Rome, and the cost was defrayed by sums of money wrung from the Moorish subjects. The equal division of the two storeys and the grouping of the windows is thoroughly Italian, but the characteristic features of some of the contemporary Spanish buildings are wanting in this design. The central doorway was completed at a later period, and the roof was never finished. The building forms a quadrangle 207 feet square and 53 feet high. The ground floor of rusticated masonry has a row of square and circular windows, and is surmounted by an upper floor with Ionic pilasters between richly ornamented windows.

Interior.

The interior consists of a series of rooms built round a large circular court about 102 feet in diameter, added by his son Louis, who continued the building of his father's original design in the reign of Philip II. The proportions of this magnificent court are most satisfactory, and one cannot but admire the long unbroken line of the Doric colonnade, supporting a second stage of the Ionic order of a lighter and more elegant proportion. It is seldom one sees a circular courtyard which is not spoiled by some excrescence or other. Probably Inigo Jones took his idea for the circular courtyard to his design for Whitehall from this charming Spanish example.

The Alcazar, Toledo.

Charles V. also made additions to the Alcazar at Toledo. In the year 1548 he employed Alonso de Covarrubias and Enrique de Egas to design the northern façade. Here we have an introduction to the essentially Spanish feature of the upper storey being formed with an open colonnade, which gives a feeling of lightness to the whole design. The rustications on this upper storey are also unusual, and were no doubt added to enrich the effect between the upper and lower storeys. The sculptured works over the windows are by Berruguette, and those of the central doorway bearing the arms of the Emperor are by Mena. The walls of this façade, which is flanked by two massive towers, are about 6 feet thick and must have formed part of the Gothic fortress.

Courtyard.

Turning to the courtyard, O'Shea says:—"The patio is worthy of the old Alcazar. It is an oblong surrounded by upper and lower galleries, each of which consist of thirty-two arches resting on Corinthian columns, all of stone and with the escutcheons of the many kingdoms and provinces over which Charles V.'s eagle could soar and call his own. This patio is the masterpiece of Vallalpando. In the middle is a bronze group representing Charles as the conqueror of Tunis, bearing the inscription, 'I shall stay in Africa dead or enter Tunis as a victor.'" Facing the entrance, and extending to the full width of the three central arches, the first flight of a magnificent staircase ascends to the upper cloister. It is one of the finest staircases in the world, and was originally designed by Covarrubias, and the story goes that Charles V. exclaimed when he was on the staircase, that he really felt he was an emperor and king. The steps are each of one block of stone of enormous width, and the size of the apartment enclosing the whole is 100 feet long by 50 feet wide. In the reign of Philip II. this staircase was further added to, and finally completed by Herrera in 1561, who afterwards turned his attention to the southern façade, forming the external wall of the staircase in 1571-84. It is Doric with four stages decorated with pilasters.

Other royal palaces were erected by various Spanish sovereigns in later years, but these do not come within the scope of this paper. The most important were the palaces of Aranjuez, San Ildefonso at La Granja, and the present royal palace at Madrid, built by Philip V. in 1737.

Colegio de los Irlandeses.

The powerful archbishops also built themselves palaces of considerable grandeur. Cardinal Fonseca commissioned Pedro de Ibarra in 1521 to erect a palace at Salamanca. The patio has fluted pillars and medallions with sculptured heads of warriors, in caps or helmets, full of grace and variety of design. Ibarra was aided by Covarrubias, to whom this beautiful courtyard is ascribed, and it may be considered one of the purest specimens of the Plateresque. The famous sculptor Berruguete was employed on this building, and executed the heads on the medallions, besides the retablo in the chapel. The building is now used as a seminary for Irish priests, and is commonly known as the Colegio de los Irlandeses.

The episcopal palace at Alcalá de Henares has a fine patio with bracket capitals, designed by Covarrubias for Cardinal Ximenez.

Town Halls.

There are many good specimens of municipal architecture of this early period in Spain, and the Casa Ayuntamiento at Seville is undoubtedly one of the best examples, although unfortunately restored and extensively added to on both sides. The façade was erected in 1526 from the plans of Diego de Riaño, who also designed the beautiful Sala Capitular, in the cathedral at Seville. As an architectural composition this façade is open to considerable criticism. The doorway seems out of proportion to the size of the windows, and the cornices and architraves are badly spaced one to the other, but the carvings of this front are so delicately chiselled and so beautiful that we can readily forgive the faults of its design. The interior contains some large rooms with decorated ceilings, and the Audiencia, or Court of Justice, is worth visiting; but perhaps the handsomest apartment of this nature in Spain is the hall of the Audiencia at Valencia, which has a magnificent *artesonado* ceiling, divided into twenty-one compartments, carved in lozenges entirely of native pine supported by a gallery with carved columns and corbels. The lower part of the walls is carved with curious old frescoes, representing the presidents of the Cortes, ecclesiastical dignitaries and the Noblesza Militar. Underneath is a beautiful dado of coloured azulejos. The window jambs are richly moulded in stone, while the woodwork of the doors and shutters, designed with elaborate Moorish patterns, is worthy of careful inspection. In fact, every available space of this apartment is highly decorated, and the effect is exceedingly charming; but the principal feature is the narrow gallery running all round the room, supported on Plateresque shafts, the interspaces below being filled up with coats-of-arms and busts of the kings of Aragon. There are other examples in Spain of rooms treated with open galleries in this manner, such as the hall of the Paraninfo, at Alcalá University, and the Salon de Santa Isabel in the Moorish palace at Saragossa; but I do not know of any other apartment in Europe treated in this manner, or which has so remarkable an effect as this noble room.

Saragossa Town Hall.

The Ayuntamiento at Saragossa is another civic building of the Early Renaissance period, completed in 1551, of a more severe type, but erected in a locality where building stone is scarce. It is interesting to note how the design has been influenced by the materials; rounded arches were adopted as being more suitable to brick construction. The principal façade rises in three stages, and is crowned by a boldly projecting cornice, which had to be constructed in wood. Indeed, stone not being available, most of the buildings in Saragossa have wooden cornices of great variety and form. The interior consists of one great hall roofed with groining, and divided into three aisles by rows of Ionic columns. The Court of Justice at Saragossa is a building of the same character, but here the openings in the upper storey are more pronounced and contrast very effectively with the plain space below. The façade flanked by low corner towers is simple and dignified. Two gigantic figures support the doorway, and in the tympanum above are the arms of the Luna family, who formerly founded this building as a palace.

Universities.

The universities of Salamanca and Alcalá at the end of the fifteenth century were amongst the most celebrated in Europe. Salamanca ranked immediately after that of Paris and before Oxford and Bologna; its students numbered 10,000 and upwards. Christopher Columbus came here to consult on his project for the discovery of the New World. The university has now dwindled into an ordinary college, while many of the colleges were destroyed during the Peninsular War; but the entrance to the library is still left, which is alone well worth an architect's visit to Salamanca to see, forming one of the most brilliant examples of the decorative and heraldic style. It is of the richest period of Ferdinand and Isabella, whose medallions are represented over the central jamb of the doorway, enclosed in a frame with a Greek inscription. Above are armorial bearings, busts and other ornaments. In the top stage is a relief of a pope and other persons unknown to fame. The characteristics of Moorish decorations are distinctly visible in this design; for instance, the doorways have plain jambs supporting a mass of ornament contained in a square frame, and the delicate manner in

which the ornament is treated just over the door heads increases in scale and projection as it ascends from the eye.

Staircase.

A staircase in the interior is worthy of note, richly carved with foliage and curious reliefs, representing bull-fights of the fifteenth century. The return of the handrail at the angles is very ingeniously worked, but with the exception of one or two rich doorways, these few examples represent the most important features of what is left of this once famous university.

Alcalá de Henares.

The buildings of the university of Alcalá de Henares have been sufficiently spared to convey some idea of their size and importance during the days of its prosperity. The façade is the work of that thoroughly Spanish architect, Alonso de Covarrubias, whose work is generally marked by the most refined and delicate detail, as we have already seen in the patio of the episcopal palace at Salamanca. The chief characteristics of this façade are the effective treatment of the upper storey, with its rows of arched windows placed on either side of a central pediment decorated with the arms of Charles V., the comparatively plain wall space below, and the tasteful manner in which the windows are decorated. The roof-terminals are, however, open to criticism, producing a certain fussiness of effect, but their introduction can be excused when we recall the fact that the Gothic period with its powerful traditions was then still in existence. Passing through the main doorway, a spacious vestibule leads to a series of three beautiful courtyards, extending to the Paraninfo, a grand saloon, already mentioned as having a picturesque upper gallery running round the room. Here the academical degrees were conferred. Cardinal Ximenes was the original founder of the university, and employed Rodrigo Gil de Hontañón, the architect of Segovia Cathedral, to build the chapel and other portions of the building.

Hospitals.

The cardinal princes of Spain founded many large hospitals during the reign of the Catholic kings, and thanks to their munificence, the aged and infirm were well provided for. They appear to have spent money on a lavish scale, judging from such examples as are in existence at Seville, Toledo, Valladolid and at Santiago.

Santa Cruz, Toledo.

The hospital of the Holy Cross at Toledo was founded by Cardinal Mendoza, and is built in the form of a Maltese cross. It was intended to have four patios like the hospital at Valladolid, founded a few years previously. Both these buildings are by the hand of Enrique de Egas, an Early Renaissance architect, who received his training at Brussels. The entrance doorway to the Toledo example, with its delicate carvings, is one of the most familiar specimens of the Renaissance period. The grouping of the windows, with the circular pediment over the doorway, is very pleasing, but the rounded pilaster, following the curve of the archway and then suddenly taking a perpendicular course, is not in the best of taste. Being an early work, the Arab influence is again apparent in the form of the general design.

Hospital del Rey, Burgos.

The Hospital del Rey, at Burgos, boasts of a very fine portal, pleasingly placed in the centre of a blank wall, enclosing the courtyard. I have been unable to ascertain the date of its erection or the architect's name, but it would appear to belong to a slightly later period than the Toledo example, which I might almost say it surpasses in the purity of its detail and the appropriate character of its design.

Domestic Architecture.

It has been often asked, Where did the nobility and grandees of Spain live? Travellers have remarked the absence of palatial villas, such as we find in Italy, or in our own country, situated in parks and surrounded by beautifully laid-out gardens. The only reasonable answer would seem to be that the topographical nature of the country is unsuitable for country residences. A great portion of Central Spain is an arid desert, and the inhabitants seem to be flocked together in small villages and towns, separated by wide tracts of land devoid of trees and in some cases of vegetation. The nobles had their country houses in the villages adjoining their estates, and frequently an excursion to an unknown hamlet will often repay the student in the discovery of some ducal residence of a bygone age. In the

large towns the great feature of the residential houses is the patio, some very often enclosing gardens, and there the inmates take the air in privacy, shut off from the busy streets. Every patio has its staircase, ascending in broad, easy flights, and mostly surmounted by an *artisanado* ceiling, sometimes gilt and elaborately painted. The staircase of the Casa Pilatos at Seville may be mentioned as a specimen of this class, built by Don Pedro Enriquez de Ribera at a time when the Moorish style was beginning to merge into the Plateresque. The walls are adorned with azulejos in many varied and rich colours, and over them may be seen stucco tracery of great variety of pattern. The ceiling of the staircase is dome-shaped and fantastically ornamented, a form of roof known to the Spaniards as *media naranja*. In this case it is entirely gilt. I show a view of a similar ceiling in the palace at Guadalajara. The reflected light from the windows below produces an almost indescribable effect. These ceilings were executed by Moorish workmen, who no doubt took their model from the ceiling of the Sala de los Abencerrages at the Alhambra richly honeycombed with stalactite ornament, resembling more the production of an insect or animal than the work of human hands.

Casa Conchas.

The Casa de los Conchas, at Salamanca, may be considered the most complete house in Spain of its period. The exterior is studded with stone shells, the heraldic badge of its owner. It has a fine patio and good ceiling over the staircase. The delicate traceries of the windows, the escutcheons and the enrichment over the doorway are all admirable. Perhaps the most interesting features are the iron grills which adorn the mezzanine windows, casting deep shadows on the stonework, and adding greatly to the charm of the curious effect of sunlight on the building. The skilful manner in which these grills are constructed is worthy of an investigation. There are many specimens of late Gothic grills and balconies to be found even in Renaissance buildings, but specimens of this particular form are exceedingly rare. The grill consists of three circular cages formed of twisted upright iron bars projecting boldly from the wall, bound together with horizontal bands of pierced work. The upper and lower bands are enriched with foliage, armorial bearings and turrets of Castile and pilgrim shells of St. James. These massive specimens not only screened and protected the inmates but excluded the glare of the sun.

Casa Monterey.

Amongst other old houses at Salamanca the Casa Monterey is worthy of note. Regarding its history very little is known. The date of its erection was probably about 1530, and as many of the carved shields bear the arms of Cardinal Fonseca in the form of stars, it is probable that the palace was built by that great primate, and possibly from designs prepared by his architect, Alonso de Covarrubias. The title of Condé de Monterey was created in the year 1626 in favour of Don Baltazar de Zinega, after whom the palace is called, and although he may have inhabited the building in the seventeenth century he certainly was not its founder. The open loggia on the top storey was built for the ladies of the house to promenade and take exercise in during times of disturbances when the streets were rendered unsafe. The building possessed two elegant square towers or *miradores*, with upper galleries of open arcaded windows, and the cornices are surmounted with a lace-like fringe in pierced stone, known to the Spaniards as *antepecho* work. Built of a warm-coloured stone, the palace has a very striking appearance when seen in the light of the afternoon sun. There is nothing of much interest in the interior, the building having been gutted during the Peninsular War.

Castles.

The castellated architecture of Spain is sufficiently important to present food for a paper by itself; it has not, however, been as yet properly investigated by modern writers. The Alcazar at Segovia is a fair specimen, but the structure itself is practically modern, having been rebuilt almost from the foundations after a disastrous fire in 1860. This once impregnable fortress is most picturesque, situated at the extremity of a rock promontory, built at the end of the eleventh century. It was repaired and embellished by Enrique IV., and Philip II. employed Herrera to redecorate some of the saloons. Charles I. of England lodged here in 1623, and here Gil Blas was confined in its dungeons. The exterior of the castle is striking. The great keep rises in a square mass, crowned with a row of turrets

There are few windows, while the whole effect is that of strength and defiance. The surfaces of the walls are diapered with a curious pattern in stuccowork. Formerly the great halls of the interior were decorated in the Gotho-Moresque style, and possessed superb ceilings with stalactite ornament springing from richly-gilt friezes decorated with heraldic shields, intermingled with verses from the Koran. The remains of another fine Castilian castle exist at Coca, within 10 miles of Segovia. It is a grand specimen of a genuine old palace fortress of the Hispano-Moresque period. It is built almost entirely of brick with wide mortar joints, and bears traces of bands of stucco decoration. The massive walls of the fortress rise out of a deep moat, and the angles are protected by sturdy octagonal towers crowned with turrets. The upper part of the walls are deeply slit for archers, and the lower portions have curious flat arches projecting over the foundation, while the whole composition is dominated by a huge donjon-keep entirely devoid of openings.

Remains of an even larger castle of this nature may be found at Alcalá, near to Seville, and the castle of Madina del Campo is a good specimen. Finally, and in conclusion, I feel that there is much to be learned from the architecture of Spain, and can only express the hope that more of our students will visit the Peninsula and add to our knowledge something more of the architecture of a country perhaps the least visited in Europe.

Mr. R. PHENÉ SPIERS, in proposing a vote of thanks to the author of the paper, said he occupied a very different position than was usual with him. He had never been to Spain, but it was on his suggestion that Mr. Prentice went to that country instead of to Italy. It was therefore rather difficult to say much about the subject of the paper because he had never seen the buildings therein described. He might say, however, he had sent a great many students, both English and American, to Spain, and indirectly therefore he had received a certain amount of information regarding the buildings. He thought the cathedral at Granada was an extremely interesting example of Spanish architecture, though its value to a certain extent arose because in the construction it was evident that the architect was well acquainted with Gothic vaulting. In the Escorial they were confronted with an extraordinary building. Mr. Prentice showed them a large plan, and he had spoken with enthusiasm about it. He (Mr. Spiers) held a different opinion. He could only speak from an acquaintance gained through drawings and photographs, but he thought one could judge buildings from illustrations. He would describe it as one of the most commonplace buildings in its execution, though the plan was grand. The front was like a warehouse, and inside the courts the five rows of windows lacked architectural composition. There was a total want of scale and too much contrast. The portion of the paper which dealt with domestic work was interesting, and he was struck by the fine contrast of plain masonry with very enriched work.

Mr. ALAN POTTER seconded the vote of thanks, and said the subject of the paper was an entirely new one to the Association. They had been shown work in Spain, the existence of which was unknown to many of the members.

Mr. H. TANNER said he had visited the Escorial when in Spain and enjoyed it immensely; the buildings had some very fine detail. Segovia he described as the most charming place he had visited in Spain.

Mr. T. R. SPENCE and Mr. LOUIS AMBLER also supported the vote of thanks.

EXCAVATION OF CORBRIDGE.

THE Roman site of Corstopitum, near Hexham, in Northumberland, has long been recognised as likely to offer valuable results to excavators. Situated at the point where the main road from York crosses the Tyne, its position and extent distinguish it alike from the military camps along Hadrian's Wall and from the fortified halting-places on the Roman road, while the former finds of a massive silver dish and two altars with Greek inscriptions show that here are the buried traces of a wealthier and more mixed community than was to be found elsewhere on the military frontier of Roman Britain. The whole area is cultivated land, and has apparently been unoccupied since the time of the Roman evacuation.

Excavations on the site, with a view to determining its general character, were carried out during last summer by the Northumberland county history committee. Briefly

the results were to show that the foundations of Roman buildings remained intact at all points, and that in some places walls remained six or seven feet high. Built into one of the walls were discovered the quoins of the largest and most elaborate arch yet met with in the North of England. The outer defences of the town were also found, and the uncovering of painted plaster and flooring of good quality corroborated the view that Corstopitum possessed buildings superior to anything hitherto known near Hadrian's Wall.

The remains of the Roman bridge were surveyed, three or four of its piers being found embedded in the northern bank of the Tyne.

These results demonstrate that the systematic excavation of Corstopitum will yield most valuable information regarding Roman civil life as brought into touch with the troops on the frontier.

The Northumberland county history committee could not itself undertake so large a work, and a Corbridge excavation committee has been formed, including representatives of the London and Newcastle Societies of Antiquaries and of the Universities of Oxford and Cambridge. Captain Cuthbert, D.S.O., of Beaufort, the owner of the whole site, has lent his active co-operation, and the sum of 1,000*l.* has already been promised. A complete excavation of the site is likely to cost about twice this sum, and may require five summers' work. Subscriptions may be paid either to the treasurer, Mr. Howard Pease, F.S.A., Otterburn Tower, Northumberland, or to the secretary, Mr. W. H. Knowles, F.S.A., Gosforth, Newcastle-upon-Tyne. An illustrated report of the excavations will be sent to annual subscribers of upwards of 2*l.* 2*s.* and to all donors of 10*l.* The excavations will be carried out under the personal supervision of a properly qualified archæologist.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the rooms of the above Society on Thursday, the 14th inst., Mr. G. P. Bankart read a paper on "Plaster Work," Mr. H. S. Chorley, president, in the chair.

The lecturer said:—The task of condensing so immense a subject into a space of a few minutes is, I fear, no light one. Historically the subject has on more than one previous occasion been compressed within the limits of a paper. Plaster has so long been looked down upon, and perhaps rightly so, for its modern commonplace vulgarity of treatment, that it seems almost incongruous to think of it as a vehicle of art. The primary object of the decoration of a ceiling or of a wall, as in, I think, all decoration, was the giving of pleasure to the eye. The construction of the ceiling has undoubtedly its bearing on the design. We have a method of constructing our modern plaster decoration by casting with fibre and wood, and this is a method of convenience. Whether the process itself is right or wrong is another matter; much of our modern construction calls for it, and it has come to stay, at least, for a time. Unlike the plasterwork of the early centuries, which was a mere coating, our process is a casing. It would be a fatal error to suppose that the undulating surfaces of ceilings would have been left had there been more skilful workmen. It does not follow that because the surface of the ceiling bulged or undulated it was altogether due to the negligence of the plasterer. All the crafts are alike in this respect. Joists were then cut and shaped by hand, and unevenly laid and irregular of surface when lathed over. Walls were irregular also, roughly built, and in the early times the plaster followed suit. The materials were prepared and mixed as they had been mixed for centuries, and in application they relied very largely on doing the best they could with the freedom of the hand and the judgment of the eye rather than on the over exactitude of the rule and measure. We must give credit at any rate for these men using plaster in a plastic form. I claim for plaster at least that respect and technical liberty which are due from the artist to any other material or medium of expression, whether the surface of operation be large or small.

The lecture was illustrated by many fine lantern slides.

The Committee of the Irving Memorial announce that the work of executing the statue of the late Sir Henry Irving has been offered to and accepted by Mr. Thomas Brock, R.A.

Transept Roofs, Abbeydore Church.

SIR,—Will you allow me through the medium of your valuable paper to make known the urgent need of this beautiful and interesting Cistercian abbey church?

Nearly four years ago a considerable reparation was effected under the supervision of Mr. Roland W. Paul, F.S.A., architect. The entire flooring was taken up, which lay upon an earthen bed rather more than a foot deep, on the surface of which were scattered human skulls and bones. These were carefully collected and sealed up. The earth having been removed, the whole area was concreted and the floor relaid as it was before. The roof of the presbytery (the most beautiful part of the church) was re-covered with stone slates, boarded and felted. Scudamore's plaster ceiling, being in a broken state, was removed, and oak boarding substituted for it behind the joists. A complete system of drainage has been carried out, and the buttresses of the eastern chapels carefully underpinned. The repair of the tower roof and battlements entailed a considerable outlay. The latter had to be rebuilt and the old roof replaced by a leaden one. This repair alone cost 500*l*. The entire reparation (as far as it has gone) cost just 2,000*l*.

It was intended to treat the transept roof and ceiling (for which this appeal is being made) in exactly the same way as that of the presbytery, preserving Lord Scudamore's interesting woodwork and substituting oak boarding at the back of the joists for the present plaster ceiling, and relaying the stone slate roof on felt and boarding. But our good intentions were frustrated through lack of funds.

The transept roof, at that time very bad, is now in a most dilapidated and dangerous condition, the laths on which the slates are nailed having rotted in numerous places, causing the tiles to slip and leaving openings in the roof through which the rain pours in upon the plaster ceiling below.

I cannot help feeling that when it is publicly known that this portion of the church is in such a sad and dangerous condition and—more than this—a source of danger to the repaired portion, as well as to those who pass under it, that the 1,100*l*. required will be forthcoming.

My deepest and heartfelt thanks are due to the many friends and well-wishers who have so generously responded and enabled me to repair this beautiful Cistercian relic, so far, for the reverent worship of God. And I am emboldened to think, judging from the many who have visited and continue to visit the abbey, that their interest in it is still keen and unflagging. The very fact alone of this Cistercian presbytery being the only one in the country used for Divine service is sufficient to rouse the interest of all lovers of ecclesiastical architecture for this church, possessing as it does an interest and beauty so unique.

ALFRED PHILLIPPS, Rector.

Abbeydore, Herefordshire: March 15, 1907.

Royce, Ltd.

SIR,—As considerable confusion appears to exist as to the relationship between Messrs. Rolls-Royce, Ltd., motor-car manufacturers, and ourselves—we being, for instance, frequently asked how our motor cars are progressing and receiving communications intended for our friends—we should be obliged if you would, through the medium of your columns, allow us to explain that Messrs. Rolls-Royce, Ltd., have taken over the automobile business inaugurated and formerly carried on by us at Cooke Street, Hulme, Manchester, where they are continuing the manufacture of the well-known "Rolls-Royce" motor chassis; that our offices and works, which have been considerably enlarged to meet the rearrangement, are situate at Trafford Park, Manchester (now our only Manchester address), and that we are there continuing the manufacture of the "Royce" dynamo-generators, electro-motors, motor starting and controlling switches, switchboards, arc-lamps and accessories, and the "Royce" electrically-driven cranes, hoists, capstans, winches and transporters. The two firms are totally distinct and separate companies, Messrs. Rolls-Royce, Ltd., manufacturing motor cars, and we electrical plant, cranes, hoists, &c., and should not in any way be confused with one another.—We are, sir, yours faithfully, for Royce, Ltd.,

T. RITCHIE, Commercial Manager.

GENERAL.

An Exhibition of Drawings, principally from Venice, by Mr. Arthur Studd, has been opened in Paris. Among the views is one of Hampton Court.

The Foundation-Stone of the Higher Broughton Synagogue, Manchester, which is being constructed from the designs of Mr. Delissa Joseph, F.R.I.B.A., was laid on Monday by Sir Marcus Samuel, in the presence of the Lord Mayor of Manchester.

M. Edouard Toudouze, the painter, died in Paris last week of influenza. He won the Prix de Rome in 1871. Recently he prepared for the Government several cartoons which were reproduced in tapestry at the Gobelins.

A Sum of 30,000*l*. is required for the repair of the ecclesiastical buildings which were ruined by the Kingston earthquake.

Lord Alverstone, in presiding on Tuesday in the new Central Criminal Court, said he desired to congratulate the Corporation of London and the legal profession upon the new buildings. So far as one could judge the buildings were admirable in their arrangements in every way. He had no doubt that some minor points would be rearranged in the working of the buildings; as they were they seemed most admirably designed.

The Competition for a poster for the Scottish Exhibition of next year attracted over sixty competitors. The first prize of 50*l*. was awarded to Mr. F. H. Ball, Nottingham. The second prize of 20*l*. was gained by Messrs. M'Lagan & Cumming, of Edinburgh.

Mr. Paul Hoffmann has removed from Palmerston House, where he has carried on his practice for the last fifteen years, to new offices at Capel House, New Broad Street, the recently completed building on the south side of the street.

Mr. W. L. Wyllie, A.R.A., the painter of shipping and tidal rivers, was on Wednesday elected a Royal Academician.

The Ayr Auld Brig preservation committee submitted a petition at Ayr Dean of Guild Court on the 15th inst. asking warrant to carry out the proposed preservation works on the bridge. Mr. Wilson, C.E., Glasgow, the engineer; Mr. J. A. Morris, Ayr, the archaeological expert; and Mr. Robert Welsh, of Messrs. Shaw & Welsh, solicitors, Ayr, the hon. secretaries, appeared on behalf of the committee. The Court granted warrant, leaving it to the Town Council to authorise the closing of the bridge to traffic.

Mr. Robert George Clutton, senior partner in the firm of Messrs. Clutton, the agents to the Commissioners of Woods and Forests and the Ecclesiastical Commissioners, as well as to Lord Normanton and other large landowners, died last week. Mr. Clutton, who was sixty-eight years of age, was the eldest son of the late Mr. John Clutton, the founder of the Surveyors' Institution, and was formerly a member of the Council of that body and of the Surveyors' Association, the Land Surveyors' Club and other bodies connected with the profession.

The New Baptist Church at Hertford, which was designed by Messrs. George Baines & Son, of London, was opened on the 14th inst. by Mr. Herbert Marnham, treasurer of the Baptist Union. The Rev. W. Cuff preached at the afternoon service. It is seated in oak, with oak pulpit, and accommodates 548 persons in a mixed congregation, all on the ground floor. The contract amount was 2,251*l*. The builders were Messrs. F. Wood & Co., of Luton.

The Sub-Committee of the Dundee Town Council in charge of the plans of the new Technical Institute have met for further consideration of the four sets of competitive designs which have been submitted. There were seven members of the committee present, over whom Mr. William Henderson presided, and, after discussion, a unanimous report and recommendation were arrived at with reference to procedure regarding the plans.

A Paper will be read at the Institution of Civil Engineers on Tuesday upon "The Application of Hydro-Electric Power to Slate Mining," by Mr. Moses Kellow, Associate.

The Italian cotton manufacturers have decided to construct their own cotton docks at Genoa and Venice, and if necessary at other Italian ports. Two Italian engineers are proceeding to Liverpool and Bremen in order to study the methods employed there of unloading and storing the cotton.

The Architect.

THE WEEK.

THE recommendation of the majority of the committee of inquiry respecting the Royal Hibernian Academy, which would confine its work to organising exhibitions, leaving the teaching to the school of art connected with the Department of Manufactures and Agriculture, has given rise to petitions to the House of Commons. One was signed by (1) the joint art committee of the Ulster Society of Architects, the Belfast Arts Society and the Ulster Art Club; (2) students at the City of Dublin technical schools; (3) art teachers and students of Cork; (4) citizens of Cork; (5) art teachers, students and citizens of Limerick; (6) art teachers and students of Waterford; (7) artists and citizens of Belfast. The memorialists unite in declaring that any Bill founded on the recommendations of the committee of inquiry aimed at depriving the Royal Hibernian Academy of its academic functions must inevitably tend to its abolition and to the discouragement of art in Ireland, and that such a proposal is most untimely, having regard to the large amount of independent effort which is at present being directed to the development of art in Ireland. The Government do not appear to be unfriendly to the Academy, and ask for a proposal by which the rival schools could be enabled to co-operate in the training of students. It should be realised that although the Academicians may endeavour to teach students, the exhibitions in which the results of their teaching are seen cannot be considered as satisfactory. Changes of some kind will be necessary if the official system is set aside. At the same time it must be allowed that the small sum assigned by the Treasury is not sufficient to enable the Hibernian Academy to compete with the Royal Academy in power of teaching, and the wealthy people in Ireland will not aid in supplementing the annual grant.

THE committee of organisation and the local committee of the International Congress for Hygiene and Demography, which is to be held in Berlin, have resolved to give occasion to the members of the Congress to make themselves acquainted with the numerous hygienic institutes of Berlin and its environs. The scientific meetings will not be extended beyond 2 P.M., in order that the afternoons may be reserved for such sight-seeing. Through the presidents of the different sections more than a hundred establishments have been chosen, which can be visited during the Congress, partly *à libitum*, partly in groups under a special conduct. A "Hygienic Guide" will give a short description of the institutes in three languages in such a way that the members can select the subjects which would be most interesting to them. The local committee, under the presidency of Dr. EILSBERGER, consists of representatives of Imperial and State Offices, the Municipal Council of Berlin, members of the Faculty, of physicians, directors of different hygienic societies, engineers, agriculturists and special journalists.

It is not unlikely that the ignorant classes in Paris will misinterpret public opinion concerning churches, and imagine that sacrileges and robberies from them will be only lightly punished. In that way we can understand why an effort was made a few nights ago to rob the church of St. Merri, and with success, although the thieves were unable to escape with their booty. The church is in the Rue Saint-Martin and is quite close to the Rue de Rivoli. The building is one of the most curious in Paris. It is believed that 1,200 years ago a church stood on the site, which was succeeded by other structures of a subsequent date. It would be

difficult to say whether there is any genuine masonry-work in the edifice, but it has at least all the characteristics of late examples. What makes the style appear odd is the way in which Gothic and Renaissance are commingled. On one face the arches are pointed; if we look on the other side they are transformed into round arches. The porch appears on the exterior to be a remarkable example of Gothic sculpture, but it is said that the numerous statues occupying the niches were all made in the middle of last century and were direct copies of figures at Notre-Dame. It is well known that extensive works were carried out in the reigns of FRANCIS I. and LOUIS XIV. as well as in a later time. But sometimes the works seem to have been alternated as if a definite style was to be avoided. As a curiosity the church is deserving of examination by architects who may visit Paris at Easter, for it suggests within a limited compass the peculiar laxity which was for many years tolerated in France.

THE committee of the Glasgow City Council who have charge of the building regulations under the Act of 1890 could not be expected to be satisfied with the decision of the House of Lords respecting the street register, on which we commented last week. It is said that over 20,000*l.* has been expended in the litigation. The decision has to be accepted, but it is considered desirable to leave an opening for a future attempt to obtain frontages without paying for them. Meanwhile the following notice has been drafted:—"To repeal, alter or amend section 9 of the Glasgow Building Regulations Act, 1900, and in connection therewith to enact that it shall not be necessary to enter in the register of streets provided for in that section and in the relative map (a) the width of any street or (b) the distance between the centre of any street and the building line thereof; to provide for a new or amended register of streets and relative map, and to repeal sections 20 and 21 of the said Act in whole or in part." The terms of the clauses are under the consideration of a sub-committee of the Corporation. It has yet to be seen whether the 5,500 owners or occupiers of property who consider themselves aggrieved by the entries in the streets register can be pacified without compensation.

It has often been said that an archæological Domesday Book would be a valuable acquisition. It would be advantageous also for those who possessed proprietorial or allied interests in the objects recorded in the pages, for they would be likely to esteem it more highly because of the interest taken in them. An approach to such a register is found in the plates of the photographic surveys of some counties. And in any case photography could lend invaluable aid as a substitute for description. Mr. C. A. CLAYTON, of Brighton, has suggested that the Sussex Archæological Society should undertake the work for that county. Although parts are in immediate connection with London, and therefore, as it were, under strict supervision, there are other parts in which interesting remains might be removed or transformed without any criticism from those who desire the preservation of antiquities. Mr. CLAYTON refers to the case of a half-timbered sixteenth-century cottage at the entrance to a village which conferred distinction on its surroundings. It was recently destroyed and replaced by red and yellow villas. In a neighbouring village an ancient farmhouse was also doomed to destruction. Fortunately a suggestion was made to the owner that reparation would serve his purpose equally well, and the relic still exists. As the Sussex Society has the services of sixteen local secretaries and they could also call in voluntary assistants, it would not be difficult to make a record of whatever has survived in the different districts. Guide-books are useful, but they are far from being exhaustive, and something more is required to suggest the wealth of the county in products of a past age.

THE BRITISH CLAYWORKER AND HIS RIVALS.

IF we believe Mr. RUSKIN, our fields of fine clay were not given to us to be made into oblong morsels of one size, but in order that men who could not handle a chisel might knead out of them some expression of human thought. And until architects know how to use clay they will, according to him, never know how to use marble. If literally accepted, the words would appear exaggerated. But anyone who considers the wonderful adaptability of the clays of England for manufacturing purposes must acknowledge that they are capable of serving far higher purposes than were supposed practicable fifty years ago when Mr. RUSKIN was preaching or prophesying. Clay has been so closely associated with the history of civilisation, it demands our reverence, and the potter's wheel has been adopted as an emblem to symbolise many purposes from the earliest times. Other countries may have used clay in a more remote age than did the inhabitants of this country. But explorers have found that it served the purposes of the primitive dwellers in the island. The Romans no doubt demonstrated how the art could be improved, and it is quite possible that the scene depicted by Sir ALMA-TADEMA was real and that a Roman emperor considered a British pottery worthy of a visit. Clay-working has undoubted claims on modern Englishmen on account of its historic interest.

It is not necessary for us to follow the useful and manifold purposes in which clay was employed. But we think it can be asserted without fear of contradiction that the revival of industrial art in this country was and is closely connected with pottery. We are not among the idolaters of JOSIAH WEDGWOOD, for we are aware of the shortcomings of his system. But there can be no doubt that he was able to demonstrate the relation between pottery and sculptured art, or, in other words, between manufactures and what was known at the time as High Art. It would have been advantageous if at a later time those who were appointed to teach ornament and decoration could have realised that pottery deserved more attention than any other kind of manufacture. Owing to a number of circumstances textiles were preferred, as if England was mainly dependent for success upon the cottons of Manchester. It was not perceived that although textiles afford opportunities for surface decoration alone, in pottery, or in most varieties of it, there is in addition a necessity for creating beautiful forms. In that way there is a connection with work in other materials which is not possible with textiles. As an outlet for the expression of any skill in art which may be possessed by Britons, pottery is deserving of the protection of the State, for it can combine design, painting and modelling.

There is, however, another development of the potter's art which England can claim as especially its own. If it were not for the co-operation of the maker of what is simply called "sanitary ware," would there be much use in sanitary science? Those who talk loudly about the diminution of the death-rate, preventive medicine and much else, rarely give due acknowledgment to the labours of the potter, which made theories become actualities. It is only necessary to visit any sanitary exhibition in order to be impressed with the countless variety of the forms in which clay has been made to serve the requirements of hygiene. Improvements are being constantly carried out, and there is no doubt that under proper encouragement not only the producers of sanitary ware, but of all other kinds of wares in which clay is the principal element, would be able to supply all wants of Great Britain, whether æsthetic or material, without the least aid from the rest of the world.

When we say encouragement we do not mean subsidies from the Treasury. The potters have improved and extended their art independently of all State aid. Even in the matter of artistic education, as we have suggested, they were not properly treated. CARRIER-BELLEUSE, SOLON and SALMON compensated

for any lack of official teachers. The encouragement we mean is of another kind. It is mainly the adoption of fiscal means to preserve not only the potters but the people of this country from the practices of foreigners which must be described as opposed to all legitimate principles of commercialism, if they are not absolutely dishonest. Anyone who may think such proposals unwarranted has only to glance at the report on the pottery industries by the Tariff Commission which has been lately issued.

One advantage of the evidence is that manufacturers are allowed to express the results of their own experience in their own words. There is consequently an entire absence of the diplomatic vagueness which is supposed to be essential in documents by officials of the British Government. In the reports there is no concealment of facts. The sufferers are allowed to relate the losses which arise through a lax system. Messrs. DOULTON & Co., for example, produced an article from a registered design which was sold for 16s. a dozen. The Germans made copies, and sold them in this country at prices varying from 3s. 6d. to 12s. 6d. a dozen. Such an extraordinary variation in foreign prices is by itself enough to prove that German competition is regulated by novel principles. Indeed, our registration system as administered affords no protection for those who employ it. Numerous firms testify that registered patterns can be reproduced in Germany and sold in England without any remedy, while if Germany is supposed to suffer by imitation of one of her designs her Government protects him voluntarily by stepping in and confiscating everything bearing that design. In our trade, said one witness, there never was one good foreign design that was not copied from an Englishman's. The imitation is most irritating, and there is no redress. Any novelty we bring out, said another representative, a new shape or pattern, is at once copied and sent here, even to our own town (Longton), to compete with our productions. One manufacturer related how he had forty models prepared, and the Germans copied and applied thirty-eight of them. Imitation of the kind may be flattering, but it is not advantageous to the English potter. While Germany is mentioned it is to be regretted that Austria, which for a long time was recognised as a fair-trading country, is now becoming notorious for its piracy. Another rival is Japan. For a long time the country possessed a style of its own and was proud of it. But the people are now realising that dishonest copying can bring profit, and they are making and selling what are called standard, that is British, lines of goods. When it is remembered that the potters in Japan are paid about 4d. a day, competition would be hard enough even under fair conditions.

It might be supposed that in sanitary ware England was secure. Any Englishman who has lived on the Continent must be pardoned if he does not esteem the inhabitants as remarkable for cleanliness. SVENGALE's exclamation about the absurdity of an Englishman taking a daily bath, and poor TRILBY's admiration of a clean Englishman were no exaggerations on the part of DU MAURIER. Yet it is curious that foreigners, who are so indifferent to employing aids to cleanliness and sanitation, are competing with English traders in producing them, especially for people in distant countries. The export trade of sanitary goods to Germany is said to have stopped entirely, owing to the hostile tariff of 10s. a ton, but their own manufactures are adequate for any use made of them. If in connection with trade anything could be considered as ludicrous it is the foreign endeavour to gain a reputation in sanitary wares. But the opposition to the manufacturers of this country is so intense there is no fear of the ridicule which is supposed to be fatal to absurdities.

Another class of goods has also of late attracted foreigners. Although common bricks and tiles are left alone, other classes of bricks—such as flooring and fire proof ware—are now introduced largely in England.

Foreign fireproof flooring is in demand. A case is mentioned of a British colliery firm giving a contract for building coke ovens to a foreign firm, and they used 1,200 tons of foreign bricks. This, strange to say, was in the very home of the firebrick trade. Among other kinds of goods which are also going from us are door furniture and porcelain electrical fittings, for both are now largely imported.

One witness was not afraid to say, after his observations in foreign countries, that the English potter is the best in the world. But it is believed that owing to the depression in trade and the hopelessness of any improvement in his position, the English potter is becoming indifferent and desponding. Improved education does not appear likely to create successors who will be superior to the present race, for owing to the unsteady nature of the employment desirable apprentices are not attracted. There is reason for their hesitation. In the Longton and Fenton districts the imports of foreign china are calculated to mean a loss of 5,000*l.* a week to the working potters alone, and probably subsidiary trades lose 2,000*l.* a week. It should not be concluded that the apparent inferiority is due to the superior system of production employed by foreigners. There are some people who will not believe that extraordinary measures are adopted in order to undersell English manufacturers in their own country. It might, for instance, be supposed that although "dumping" should serve with iron and steel goods, it would be ridiculous in the case of pottery. Jugs can be bought in England for 9*d.* which in Germany cost 1*s.* 7*d.* Flooring tiles are shipped to Australia below ordinary cost price. Silica bricks, firebricks, magnesite bricks can be obtained in this country at prices lower than the normal cost of production abroad. Dutch tiles, which in Amsterdam cost 6*s.* per square yard, can be obtained in London at 5*s.* per square yard. Messrs. WOOLLISCROFT, who should understand the condition of the trade, say that a duty of 10 per cent. ought to be imposed on imported floor and wall tiles, and they refer to one of the largest firms of pottery manufacturers, who propose erecting new works in the United States and closing their factories in this country unless tariff reform comes along within a reasonable time. Other firms suggest that the duty on Dutch glazed tiles should not be less than 20 per cent. There are advocates of 33½ per cent.

Experience alone can demonstrate whether the imposition of a duty on imports of pottery to this country which would correspond with what has to be paid by English traders in foreign countries would be sufficient to regain English supremacy in the world's markets. There may be other conditions which would have to be considered. Nevertheless, it is remarkable that out of sixty firms in the china trade no less than fifty have agreed that a measure of the kind is essential. About one-half of the remaining ten are favourable to an import duty, but as they have partners who believe in universal free trade they are compelled to stand out. In this country we are not much disposed towards theories. However, when one is taken up it becomes like one of the axioms in geometry, and is esteemed as a necessary truth. Much has occurred of late years which should be sufficient to convince people that beliefs which were comprised among the eternal verities have to obey, like meaner things, the law of mutation. Unrestricted free trade undoubtedly served temporary purpose, and preserved Ireland, if not Great Britain, from famine. But other countries who also studied political economy and were without any temporary incentive to the adoption of the principle declined to see in free trade a panacea for earthly evils. They may have been mistaken in not following the example set by this country. But their business is growing whilst ours is declining. It would seem before affairs go from bad to worse that it would be wise to try some experiments in Protection. The pottery trade might be selected. It is not well to have

examples of dishonest practices before the public gaze in every successful crockery shop in town and country. The display is not only bad in itself, but it teaches English people the advantage of renouncing the old way of trusting one another, which has been one of the causes through which Great Britain has held its own against the world. English potters can supply all the requirements of Englishmen, and they are numerous enough to prevent any charging of disproportionate prices for honest ware.

PUBLIC LIBRARIES.*

HARDLY more than a century has elapsed since it was enacted in England that unless regularly licensed by the magistrates every house, room or place which was used for the purpose of reading books, pamphlets, newspapers, or other publications was to be deemed a disorderly house, and the owners were to be punished as the law directed in the case of disorderly houses. To lend books on any subject whatever without permission of the magistrates was to incur a fine of 100*l.* a day, and the fines did not exempt a culprit from the punishment incurred as the keeper of a disorderly house. We have reason to be thankful that the England of 1907 does not correspond with the England of 1799, for then the author and publisher of the latest volume on public libraries would probably find themselves charged with high treason.

It was not to be expected that under such conditions much attention would be given to the planning of buildings for libraries. For centuries it was supposed that a square or oblong room was sufficient. The library of Leyden may be taken as an instance, for it was attended by students from all parts of Europe. A very careful etching suggests its appearance in 1610. It was lighted along the sides by large windows. The books were arranged in two rows of shelves or cases running parallel, with a passage dividing them and with only sufficient space between each case to allow the student to stand while searching for the book he required. Each case was inscribed with the class of books it contained in large letters above it. On one side were volumes on history, medicine and law; on the other side were works on mathematics, philosophy, literature and theology. There were no seats, but a student who wished to read had the use of a desk on which he could rest his folio. A few globes and views of places completed the furniture. Evidently at the time it was not supposed to be desirable that anyone should study literature with the comfort which is now possible in the great libraries in Paris or London. There must have been little difference as regards the difficulty of consulting works between a student in the library of ASSUR-BANI-PAL and a student in one of the university libraries of the Early Renaissance period.

As soon as it was decided that libraries were to be provided for a great number of people who were not possessed of the philosophic patience of the ancient students, it became necessary to avoid any infliction of the self-sacrifice which was supposed in the old days to be inseparable from the study of books. Arrangements had also to be made to provide for the increase in the number of books which were required. In most of the older libraries that was not considered as necessary. The collection was supposed to be sufficiently complete when the library was opened, and it would lose its character if additions were introduced. It has been often related that books were rejected because room could not be found for them. Everything seemed to be fixed, including the readers, for collections which were supposed to be public were interdicted to all but a favoured few. The keeper was generally supposed to be jealous of all strangers. So much is now required

* *Public Libraries*: A Treatise on their Design, Construction and Fittings, with a Chapter on the Principles of Planning and a Summary of the Law. By Amian L. Champneys, B.A., architect. (London: B. T. Batsford.)

for the encouragement of readers that librarianship has become a profession which is not only important but difficult to master in all its details. The modern library, unlike the ancient, is bound to grow, and in consequence there is necessarily some indefiniteness in the planning. The number of readers, as well as the number of books, cannot remain stationary. Accordingly there should be vacant ground attached to the site for extension, or a recognition of the fact that branch or supplementary libraries will have to be erected elsewhere.

It was mainly owing to the neglect of the future by promoters of libraries that so many mistakes have occurred in the erection of buildings under the Public Libraries Act in this country. An architect must have definite ideas about what he has to provide before he can produce workable plans. Mr. AMIAN CHAMPNEYS says in his first chapter that "in many cases the architects are to blame, since they have sometimes wilfully sacrificed utilitarian to æsthetic considerations, and have only too often displayed a complete ignorance or, what is worse, a very incomplete knowledge of the special uses and requirements of this class of building. Such failures, whatever their real causes, are apt to be imputed without discrimination to the architectural profession; and to this fact must be attributed the suggestion that librarians should dispense with the services of architects and design their buildings for themselves." It is, of course, to be expected that an English architect in treating of any subject will endeavour to charge his contemporaries with ignorance and incompetence, and Mr. A. L. CHAMPNEYS has precedents in censorship. But inquiry would have demonstrated that in many cases the authorities had no clear notions about the requirements of the people, and the architect was therefore compelled to imagine what was needed. Æsthetic considerations could not fail to receive attention when so much was dubious. The number of amendments of the Act of 1855 should be enough to suggest that even the Legislature was doubtful about what should be done and how it could be attained. On one occasion an Attorney-General said in the House of Commons that the Act did not contemplate the lending of books out of the library, and to take one home was illegal. The conditions under which gifts were given by private benefactors also reveal that it was considered feasible to combine a public library with a museum, science and art school or special technical schools on a restricted area, and for a small sum of money. In some towns the library was looked on as if it were a necessary evil, like a tramp ward, and we remember seeing it stated that out of ten town councillors only one had condescended to pay a visit to the rooms. We might also refer to the discussion at a late meeting of the Architectural Association as evidence that librarians are not unanimous about the requirements of a public library, and if they designed their own buildings and dispensed with architects it is not unlikely that some imperfect arrangements would be the result.

For many, if not the majority, of readers, a public library is regarded simply as a news-room. Sometimes men and women will be found outside the doors before they are opened. They wish to look at advertisements and then they depart. Others can spend a much longer time in perusing the journals and magazines without once troubling the librarian for a book. There are other people who would be ashamed to be seen in the news-room and who only borrow books. In some libraries the books for reference receive much attention. A chairman of a section of the British Association once stated that he had sent for ninety-four books of reference to the library of Newcastle-on-Tyne and he was able to obtain ninety-three of those he sought. That indicates the extent of the supply which has to be provided, and suggests the likelihood of a large number of readers. In other towns a local and a county directory with an English dictionary would be sufficient to meet the demands of readers. It is only by experience that

the accommodation required can be gauged, and indeed it would be an advantage if in all cases temporary buildings were first erected. We must educate our masters was the declaration of ROBERT LOWE when voting power passed to new hands, and as education ought to begin early, in some libraries there is a children's department—an innovation which would appal ancient students.

In Mr. CHAMPNEYS'S book there are chapters on materials and construction, installations and apparatus, shelving and accessories, fittings, furniture and appliances, book-rooms, lending department, reading-rooms, reference department, other public rooms and spaces, administrative accommodation, finance, organisation and building, principles of public library design, and single libraries and library systems. There are illustrations not only of buildings and plans, but of the furniture, indicators, racks and other appliances. Indebtedness is acknowledged to several experts, and the book may be said to embody the conclusions which time and use have proved to be useful. The following table by Mr. J. D. BROWN will show that finance has not been omitted. It is an attempt to suggest the accommodation which can be provided from various incomes derived from rates, and is described as "the first real attempt hitherto at working out scientifically the capacity of a library building on the basis of its income":—

Income.	Annual Repayment of Loan.	Building Loan.	Furniture Loan.	Cubic Feet in Building at 1s. per foot.	Square Feet in Building.	Volumes Stored.	Readers Accommodated.
£	£	£	£				
1,000	250	3,600	400	72,000	4,412	34,000	200
2,000	500	7,200	800	144,000	8,824	68,000	400
3,000	750	10,800	1,200	216,000	13,236	102,000	with branch 600
4,000	1,000	14,400	1,600	288,000	19,200	136,000	with branch 800

10,000	2,500	36,000	4,000	720,000	48,000	340,000	with branch 2,000

ROYAL HIBERNIAN ACADEMY.

ON Thursday of last week a public meeting was held in the Mansion House, Dublin, to consider the position of the Royal Hibernian Academy and the reports of the recent Commission. Sir Thomas Drew, president of the Academy, was chairman. He said a letter had been addressed to him from one of the members of the late Commission, Mr. Justice Madden, who had shown more wisdom, more scholarship and more dignity in considering the subject than any other member of the Commission. The letter, after apologising for Mr. Justice Madden's absence owing to his circuit duties, stated:—

"The question has assumed a different aspect by reason of the statement recently made on behalf of the Government in the House of Commons. The Royal Hibernian Academy is now safe. There is no longer any danger of its functions being transferred to a school which, however efficiently conducted, could never fill the place which an Academy should occupy in relation to the highest education in art. The abolition of our Royal Academy of Arts, under any circumstances deplorable, would be especially disastrous at a time when, for the first time in the history of Ireland a serious effort is being made to develop and train the artistic capabilities of which remarkable testimony was borne by witnesses who had exceptional opportunities of forming an opinion on the subject. The efforts of those who are interested in the maintenance of an effectual Academy of Arts in Ireland should now be directed towards formulating a practical scheme of reform, a task in which I venture to hope the work done and the evidence taken by the members of the recent committee may prove useful. I am strongly of the opinion expressed in the report by Mr. Boland and by myself, that the essential condition of an effective reform is the performance by the State for Ireland of the duty which it has recognised in regard to England and Scotland—the duty of housing the Academy in a proper building in a suitable place. I believe that the educational value of the Academy might be greatly increased if the new building

were so designed as to accommodate a collection of modern works of art, for which a gallery of moderate size would suffice, capable of being added to as the collection grew. This could be done at a moderate cost. I shall willingly take part in the work of preparing a scheme of reform if it is thought that the information which I gained when acting on the recent committee could in this way be turned to account."

In view of the report of the Commission, the Chairman said that the Academy had decided to lay its grievances before the public, for the time had come to decide whether it was to exist any longer or not. Fortunately he had succeeded in interesting Mr. John Boland, M.P., in the matter, and thanks to his praiseworthy efforts, they were now in a much better position than they were, and in view of Mr. Runciman's very reasonable statement in the House of Commons the other day, they would not just now unduly press the strong case they had made against the Treasury. The Academy, as long as he had known it, had been in trouble, and its troubles dated back to the great famine. At that time Irish art was in a deplorable state, and the Academy had closed its doors. A Highland gentleman, MacLeod of MacLeod, was sent over to report on the Academy, but his report showed that he did not know what he had come to inquire about, for he confused the School of Art, at that time under the Royal Dublin Society, with the Royal Hibernian Academy. Now the peculiar thing about this was that to the present day, when the Academy brought any matter before the Treasury, MacLeod of MacLeod came uppermost. He even appeared in the recent Commission, and his report was the bedrock upon which the Academy was to stand its trial. However, they had got rid of him now, and they could bury his report decently. When the Commission was established they took the strongest possible objection to it, because it was framed to inquire, not into the circumstances of the Academy, but into the School of Art, all apparently for the purpose of dissolving the Academy. As a result of a remonstrance, it was agreed that there should be some inquiry into the position of the Academy. Two members of the Commission were independent enough to see that some inquiry was made into its position, and the strongest possible evidence was given on the matter. Out of twenty-two witnesses examined eighteen gave very strong testimony in favour of the removal of the Academy from its present site and for a proper endowment. The other two witnesses, official witnesses, were silent on the point, but did not oppose. But the majority report of that Commission utterly ignored this body of evidence, and reported against the Academy, and introduced arguments which did not arise out of the evidence. The two independent members of the Academy, Mr. Justice Madden and Mr. Boland, M.P., issued a minority report in favour of the Royal Hibernian Academy, which was also supported in its present controversy by the Royal Academy, the Royal Society of British Artists and the Royal Scottish Academy. Within the last few days Mr. Runciman, secretary to the Treasury, had stated, in reply to Mr. Boland, that the recommendations of the majority report were not such as he could accept, that something more, he felt, was required than the majority seemed to realise, that he would do all he could in the matter, and that the details of a businesslike scheme would receive sympathetic consideration. This was going a long way in the right direction, and he might say the Academy were perfectly ready to furnish such a scheme. Their complaint heretofore with the Treasury was that they were never conferred with in the matter, and that instead of taking the advice of the President, some ill-informed person was consulted, and the Academy was put off with a formal knock-down letter to which there was no possible answer. The Academy were ready now to formulate a scheme, and they were able with the ability at their disposal to do it without outside assistance. They were told that the Academy could not survive on its present endowment (300*l.* a year), and the Government had been told that it could not carry on its work in the slums, and that it had a right to be included in the new buildings to be erected at Leinster House. On that the Academy would not go back. It was farcical to say that their premises in Abbey Street were in a good position. It would be utterly useless and unnecessary to create what was called a Royal College of Art, and the suggested advisory committee to manage or teach art would not be satisfactory either. The Academy, which had never received any support, even from South Kensington, wished to keep itself perfectly free from departmental control.

Art must flourish in the open air, and that was the only place in which it could flourish. Behind that ideal the Academy would never go. It contained painters, sculptors and architects of considerable skill, and if they were not fit to give the highest necessary education in these matters, with, of course, proper means at their disposal, he did not see that anybody else could do it.

The following resolutions were adopted:—

"That in the distribution of the public funds granted for the advancement of industries, science and art, a due proportion should be devoted to the encouragement of modern and contemporary art in Ireland, and that the Royal Hibernian Academy of Arts has proved itself deserving of goodwill and approval in its endeavour to promote the advancement of the fine arts during the past eighty years, and is therefore entitled to be no longer excluded from due recognition in the distribution of those funds.

"That the purpose of the foundation of 1823 in Ireland and its charters was to give to a Royal Hibernian Academy of Arts in Ireland a like position to that declared for a Royal Scottish Academy in Scotland, viz. that it was to be considered as representative of the artists of Ireland in its due position in reference to the promotion and teaching of the fine arts.

"That in the opinion of this meeting of citizens of Dublin, a primary function imposed on the Royal Hibernian Academy by its foundation and charters, viz. of securing to the inhabitants of Dublin annual exhibitions of modern art, can no longer be maintained in its old galleries, wholly unsuited now in accommodation and locality for their purpose, and where a moderate income realised by exhibitions and devoted to a public purpose in former years can be no longer relied on; and that the Academy of Modern Art should be no longer excluded from the comprehensive group of science and art institutions at Leinster House."

HOLYROOD CHAPEL.

HOLYROOD PALACE and its more ancient chapel were visited on Saturday, the 23rd inst., by members of the Edinburgh Architectural Association and others, to the number of about 140. According to the *Scotsman*, the visit, which was one of the series arranged by the Architectural Association, was made by permission of the First Commissioner of Works, and the party were received and conducted over the buildings by Mr. W. T. Oldrieve, F.S.I., of H.M. Office of Works, and by Mr. F. H. Parsons, resident inspector, Lord Chamberlain's Department. Among those present were Mr. Hippolyte J. Blanc, R.S.A., president of the Association; Mr. J. T. Baillie, vice-president; Dr. Hay Fleming and Mr. Macintyre Henry.

Mr. Oldrieve said it was his privilege and honour to offer, on behalf of the Crown, a welcome to the members and friends of the Association. He could assure them that his own interest in the guardianship of these and similar architectural memorials of the past history of Scotland helped very much to relieve the monotony of a busy official life. Mr. Oldrieve exhibited a plan showing the oldest parts—what now remained of the twelfth-century abbey, the great tower of the original palace, built about 1500, and the late palace, built by Charles II. The early history of the abbey was quite well authenticated. The Bannatyne Club published in 1828 a carefully collected transcript from the original foundation charter from King David I., dated 1128. The original charter was stated in 1828 to have then been in the archives of the city of Edinburgh, and presumably was still there, or in the Register House, to be seen by the historical student.

Architecture of Abbey Ruins.

The myth of the miraculous escape of the king when hunting, through the interposition of a cross as he was charged by a stag, might be dismissed as a monkish legend which did not appear until early in the fifteenth century. It was certain that originally the abbey church and precincts were extensive, and that nothing at present existed which would enable them to indicate those parts which had been demolished. So far as he had yet been able to discover no very early plan existed showing even the general disposition of the abbey buildings. The very fact that so little remained of what was once an extensive abbey lent all the more interest to what was still left to us—the ruins of the nave of the abbey church, about which so much enthusiasm had recently been shown owing to the late Lord Leven's

bequest for the purpose of restoration. Mr. Oldrieve drew attention to the fascinating variety of style still to be very clearly distinguished and throwing much light on the abbey's chequered history. They would notice first, as undoubtedly the earliest and now the only remaining fragment of that period, the Late Norman doorway, now built up, at the eastern end of the south aisle, which evidently led to the cloisters. It could only be seen from the exterior, the royal vault having been built against it on the inside. They would note the interesting transition of style as they looked westward at the wall face of the south aisle.

Indications of other Buildings.

What now existed was but the nave of the original church, the tower, transepts and choir having entirely disappeared. It was said that during the course of excavation for the formation of the garden certain remnants of foundations had been observed, and the position of the steps to the high altar was thought to be indicated by benching still showing in the turf. He could not, however, at present vouch for the accuracy of these indications. The nave as a whole was not begun to be built until the end of the twelfth century, and then without buttresses. It was not until the time of Abbot Crawford, between 1457 and 1483, that these buttresses were added. Those on the north side, though massive, were embellished with extremely delicate and beautiful work in the canopies of the niches, &c., in striking contrast to the more vigorous spirit of the earlier work of two centuries before. For three centuries these noble buttresses safely withstood the constant thrust of the great stone vault of the nave, but when at last the catastrophe came and the vault collapsed there was no longer a balance of forces, and so the buttresses which supported so long the outward thrust of the vault exerted an inward thrust—thus more disastrously involving in the common ruin both north and south clerestories with the triforium and nave arcade on the north side. The filling-in of the eastern arches of the nave and aisles dated from about the middle of the sixteenth century, but the large window was blown in in 1795 and restored in 1816.

The Restoration Controversy.

The wide extent of the controversy upon the subject of the proposed restoration of the abbey church was, in his opinion, a most gratifying evidence of the general awakening of the nation to a sense of responsibility for the better preservation of our treasures of ancient architecture. The fact that many and divergent views had been expressed was not on reflection at all surprising, and he was venturing on this delicate ground, since the question could not fairly be ignored on this occasion, with two simple suggestions which might perhaps contribute to the solution of the problem. Let them see, however, whether they were not all agreed upon some important points of principle. Were they not agreed, for instance, that a chapel for the Knights of the Thistle was a desirable object, and that there ought to be a royal chapel attached to the palace of Holyrood House? If there could be unity and agreement upon a common plan, he could not believe but that very soon wealthy men of public spirit like Lord Leven would be found to come forward with the necessary funds. There had not, he believed, been so much divergence of opinion as appeared at first sight, but much of the divergence had arisen from the point of view from which the subject had been considered, and this led him to his first suggestion. Much had been said and written as to the practicability of the proposed restoration of the nave, and it seemed to him that, interesting as that particular aspect of the case might be, it did not touch the heart of the question.

Preservation of Ruins and a New Building.

His first suggestion therefore was this—that at least they as architects should look at this beautiful architectural relic as a piece of "fine art," just as the mutilated Greek statue, "Venus de Milo," was a piece of "fine art," or any "Old Master" of priceless value. If they, as architects, would not like to deny that at least the ancient masters of their craft—who produced the glories of their profession—were in truth artists, and that the fine arts still embraced architecture as well as sculpture and painting, then, he would submit, their point of view should be rather that of desiring respectful efforts to preserve what remained in all its artistic spirit and touch, beautiful and more impressive even in its decay than it could be if "restored." His second suggestion was that all parties interested should unite in a common effort to have the tower, choir and transepts built as an entirely new building, the ancient

nave forming a dignified approach, and every effort being made to preserve what remained of it from further decay. There need be no fear, in his opinion, of very early decay. If they would look at the view of the chapel in Arnot's "History of Edinburgh," published in 1779, they would wonder how little change time and exposure had wrought in 128 years. There must necessarily have been surface waste and the loss of the more delicate parts of ornament and moulding, but no part of the structure seemed to have disappeared.

The Old and the New.

If therefore means were taken still further to preserve what remained from the natural process of decay, there was no reason why the grand old ruin should not be still among the art treasures of Scotland centuries hence, when, as he would fondly hope, the chapel of the Knights of the Order of the Thistle stood—then no longer new—prized and admired for its own intrinsic beauty. One very important purpose the new church would serve would be thoroughly to screen the garden front of the palace from that most hideous view of brewery buildings and chimneys to the north-east. Dealing next with the palace, Mr. Oldrieve said perhaps they would notice a little bit of genuine "restoration" the Board of Works were carrying out on the west front of the ancient tower. It had doubtless occurred to many that the two empty recesses at the first-floor level of the corner turrets were very unsightly. After full inquiry and the advice of experts, it was decided last year to place an exact replica of the original sculptured armorial panel, which had long stood near the entrance to the chapel, in the recess from which it had been removed by order of the Parliamentary Commissioners sitting at Dalkeith in 1652. This panel was an extremely fine specimen of heraldic sculpture. He thought they would agree that it was worth doing to have a replica of it again adorning the old tower. With the advice of the Lord Lyon, Sir James Balfour Paul, they were having a similar panel prepared for the recess in the north turret with the arms of Mary of Guise, consort of James V. An experiment was being made with heraldic colours upon a model of the shield in this panel.

Changes in Palace Rooms.

Alluding to the work that had been done recently in what were called the historical apartments, he said the Board had been trying to remove what was undoubtedly comparatively modern and misleading, and to restore the rooms to what they were originally, so far as that was possible. In Queen Mary's chamber the partition which until recently divided this fine room into two parts had been removed, and they now saw the room of the size it was in Queen Mary's time. A recess on the east side of the room had been opened out, and was thought to have been a private oratory. The ceiling of the recess was worth noticing, with the white cross of St. Andrew on an azure field at the intersection of the moulded panels, all richly painted and gilt. They should notice also the private stair which evidently led up to the gaol above, and the recently discovered piece of wall-frieze decoration in distemper over the fireplace. In all these historical rooms the original stone surface of doorway and fireplace mouldings had been cleaned of paint and the woodwork grained in old oak, so as to harmonise with the fine tapestries which had been or were being cleaned and restored. The ancient furniture also was being gradually restored so far as that was possible.

Restoration of Archery Gate.

Dealing with some points of interest in the precincts, Mr. Oldrieve said the old sanctuary cell, where so recently as within his own memory debtors were incarcerated with certain protection and privileges, was now a store-room for the sergeant warden of the palace. He should like to see the Archery and outer gate restored at the foot of the Canongate, and the palace yard kept private when royalty was in residence. This improvement, with the new church, would revive the memory of old days, and their noble city might perhaps again rejoice in the presence and patronage of the King.

After the party had been shown over the palace and chapel Mr. Blanc, in proposing a vote of thanks to Mr. Oldrieve, said he appreciated Mr. Oldrieve's kindly, thoughtful and prudent words with regard to the abbey. Mr. Oldrieve was not a controversialist, and had proved himself a man of large and open mind. They were not met that day to deal with controversies regarding the restoration of the abbey, but to get information about the palace and abbey, and he was sure that whatever controversy might produce

in the future, they would be very much more enlightened upon what was being spoken and written about than they were before what they had heard and seen that afternoon. It was very satisfactory to know that the old buildings of Scotland were in the careful hands of Mr. Oldrieve, who regarded the buildings with so much interest and reverence.

Mr. Oldrieve, in replying, said all questions of architecture, archæology and kindred subjects were far above considerations of nationality.

A vote of thanks was also accorded Mr. Parsons.

TAYLOR ART SCHOLARSHIP.

THE annual adjudication for the Taylor art scholarship and prizes took place last week in Dublin, when the sum of 105*l.* was awarded in prizes. The judges were Mr. Nathaniel Hone, R.H.A., appointed by the Royal Dublin Society, and Sir Walter Armstrong, appointed by the Governors of the National Gallery of Ireland.

The judges were of opinion that no work sent in was of sufficient merit to warrant the award of the full scholarship of 50*l.* A prize of 30*l.* was awarded to work No. 10, a statuette entitled "Cuchulain," executed by Mr. Edwin McGowan, a student of the Dublin Metropolitan School of Art; a prize of 20*l.* to work No. 1, entitled "Erin," executed by Miss Eileen M. le Poer Trench, a student at the Royal Academy, London; a prize of 10*l.* to work No. 16, entitled "Girl in Pink Dress," executed by Miss Beatrice Moss Elvery; a prize of 10*l.* to work No. 25, entitled "A Portrait," executed by Miss Dorothea C. J. FitzGerald, a student at the Royal Hibernian Academy, Dublin; a prize of 10*l.* to work No. 29, entitled "Suggestion for Panel," executed by Mr. Edwin W. McGowan, a student at the Dublin Metropolitan School of Art; a prize of 10*l.* to work No. 9, a statuette, entitled "Cuchulain," executed by Mr. Albert G. Power, a student at the Dublin Metropolitan School of Art; a prize of 10*l.* to work No. 14, entitled "Macbeth and the Three Witches," executed by Mr. Maddison Branch Fisher; a prize of 5*l.* to work No. 12, entitled "The Fall of the Leaf," executed by Mr. James Carroll, a student at the School of Art, Dundalk.

KELSO ABBEY.

A PAPER was read by Mr. P. Macgregor Chalmers, architect, at a meeting of the Scottish Ecclesiological Society, on "Some Recent Researches in Kelso Abbey." In the course of his paper he said that the portions of the abbey church which had been preserved were at present understood to be a nave about 22 feet square, north and south transepts of smaller dimensions, a central tower and part of a three-aisled choir. If this were a correct interpretation, then the church of Kelso, instead of being one of the greatest of our Mediæval abbey churches, was one of the smallest. The building was then strangely disproportioned to the important part which the abbot and convent played in the nation's history. Many years ago Dr. D. C. Macvail, St. James Terrace, Glasgow, remarked upon the similarity between the remaining portion of Kelso Abbey and Ely Cathedral. Mr. Chalmers appreciated the suggestion, and after measuring and digging over the site of the abbey, was thoroughly convinced that the designer of the Scottish building owed much to his knowledge of Ely, from which he may have come. The remaining fragment of Kelso Abbey then was only the west front—a western tower with north and south transepts used as chapels and a western porch, the whole forming a galilee. The three-aisled building was the nave, extending eastward to a great choir. If the narrow enclosed burial-ground, known as "the aisle," was now accepted as indicating the position and dimensions of the choir, the abbey church emerged as a great transeptal church with a splendid west front with a western tower, a great three-aisled nave of seven bays and a central tower and transepts. It was impossible to determine the plan of the choir, but the suggestion might be offered that the original structure was designed with a semi-circular apse, and that this apse was removed at a later time and the choir lengthened and terminated with a square end. From the evidence which had been adduced they found that the total internal length of the abbey was 302 feet. It ranked as the second longest church in Scotland, being only exceeded in length by the cathedral church of St. Andrews. The design of the west front of Kelso Abbey, of which so

much happily remained, was the finest and most impressive in Scotland, worthy of its great founder and of its splendid history. Its source might with good reason be found in the contemporary design of Ely Cathedral.

TESSERÆ.

Hindu Buildings.

IN a few places in Hindustan are found the remains of ancient buildings which have attracted the attention of Europeans, and have, where there existed a predisposition to wonder and admire, been regarded as proofs of a high civilisation. The entry, says Dr. Robertson, to the Pagoda of Chillambrum is by a stately gate under a pyramid 122 feet in height, built with large stones above 40 feet long and more than 5 feet square, and all covered with plates of copper adorned with an immense variety of figures neatly executed. The whole structure extends 1,332 feet in one direction and 936 in another. Some of the ornamental parts are finished with an elegance entitled to the admiration of the most ingenious artists. Another structure still more remarkable than that of Chillambrum, the Pagoda of Seringham, situated in an island of the river Cauvery, is described by Mr. Orme as composed of seven square enclosures, one within the other, the walls of which are 25 feet high and 4 thick. These enclosures are 350 feet distant from one another, and each has four large gates with a high tower, which are placed one in the middle of each side of the enclosure and opposite to the four cardinal points. The outward wall is near 4 miles in circumference, and its gateway to the south is ornamented with pillars, several of which are single stones 33 feet long and nearly 5 in diameter, and those which form the roof are still larger; in the inmost enclosures are the chapels. In this nothing is described as worthy of regard except the magnitude of the dimensions. The cave of Elephanta, not far from Bombay, is another work which, from its magnitude, has given birth to the supposition of high civilisation among the Hindus. It is a cavity in the side of a mountain, about half-way between its base and summit, of the space of nearly 120 feet square. Pieces of the rock, as is usual in mining, have been left at certain distances supporting the superincumbent matter, and the sight of the whole upon the entrance is grand and striking. It had been applied at an early period to religious purposes, when the pillars were probably fashioned into the sort of regular form they now present, and the figures, with which great part of the inside is covered, were sculptured on the stone.

Rationality of Gothic.

In one point of view Gothic is not only the best but the only rational architecture, as being that which can fit itself most easily to all services, vulgar or noble. Undefined in its slope of roof, height of shaft, breadth of arch, or disposition of ground plan, it can shrink into a turret, expand into a hall, coil into a staircase or spring into a spire with undegraded grace and unexhausted energy; and whenever it finds occasion for change in its form or purpose it submits without the slightest sense of loss either to its unity or majesty—subtle and flexible like a fiery serpent, but ever attentive to the voice of the charmer. And it is one of the chief virtues of the Gothic builders that they never suffered ideas of outside symmetries and consistencies to interfere with the real use and value of what they did. If they wanted a window, they opened one; a room, they added one; a buttress, they built one utterly regardless of any established conventionalities of external appearance, knowing (as indeed it always happened) that such daring interruptions of the formal plan would rather give additional interest to its symmetry than injure it.

Mr. Harcourt, First Commissioner of Works, authorises the statement that Mr. J. E. Ellis, M.P., has undertaken to fill up the panels in the library of the House of Commons with portraits of all the Speakers since 1377, and with mezzotint portraits of all the Prime Ministers since Sir Robert Walpole. Mr. Raphael, M.P., will also give portraits of a long series of Chancellors of the Exchequer, and Mr. Agnew, M.P., is contributing to the new dining-room panels twenty engravings and mezzotint portraits of other eminent statesmen who do not fall under the preceding categories.

NOTES AND COMMENTS.

THE Emperor of AUSTRIA will accord his patronage to the International Congress of Architects which is to be held in Vienna from May 18 to 24, 1908. The programme of subjects to be discussed has yet to be determined. The opening meeting will be in the Hotburg. The Society of Fine Arts will have a meeting in their exhibition building. The Society of Architects and Engineers will organise an excursion on the Danube, with an ascent of Kahlanberg. It is also possible there will be an excursion to Semmering, and it is hoped there will be receptions at the Hôtel de Ville and the Imperial Court. Vienna and its neighbourhood can present so much that is novel to strangers it is to be feared that business will receive but scant attention. For the sake of good-humour all the conclusions desired are likely to be accepted without much discussion.

It seems strange to find the London County Council interfering with the light of two buildings, a church and its school. The Central School of Arts and Crafts and the London Day Training College will, it is alleged, cause serious interference with the lighting of St. John's Church, which is situated at the rear of the premises, and with the lighting of the St. John-the-Evangelist school. The latter building is situated on the opposite side of Fisher Street. An informal claim has been received from the surveyor acting on behalf of the trustees of the church in respect of the damages alleged to have been sustained by the trustees in consequence of the erection of the Council's buildings. Negotiations have been carried on between the surveyor for the property and the Council without any prospect of an agreement being arrived at as to the sum which the Council should pay for alleged damage to light hitherto enjoyed by the church and schools. The education committee have come to the conclusion that certain points relating to compensation and the sum to be paid for a right to light in perpetuity over the yard at the west end of the church should be referred to arbitration, and recommend that Mr. JOHN SLATER should be appointed as sole arbitrator for this purpose.

ILLUSTRATIONS.

COUNTRY HOUSES.

THE innovation of the motor car as a means of locomotion is responsible for much more than the outward demonstration by costume of the equality of the sexes. This, although a great achievement, is as nothing in comparison with the widespread interest which has been aroused in the attention devoted to the study of week-end cottages and the more important and imposing country residence.

The beautiful stretches of country which extend miles away from any railway communication are now, through the advent of the car, within easy reach of those who in former days eschewed country life, except on periodic occasions, because of the difficulties of transit. There is no longer occasion to imagine existence in the most picturesque parts of the Home and South Counties as equivalent to entombment.

At any rate, if living amongst delightful scenery with the ever-varying charms of nature, it is well to know that on a wet day if you want excitement there is your unknown quantity horse-power car ready to swirl you away to the bustle and gaiety of the larger towns. The prejudice of fear as to premature burial can at least be modified by the satisfaction that living in the country under happy circumstances is at any rate a decent interment.

Once the glamour of country life gets home to a man it can never be lost again, and one wonders why one of the greatest delights in life has been so long neglected, and in its stead six weeks' sojourn in a too populous watering-place, domiciled in an overcrowded hotel or

boarding establishment at ruinous prices, has been sufficient to allay the craving for change from town and its never-ending bustle.

If considered financially, there is no doubt that for less money, calculated on the actual capital outlay, it is possible to have a domicile of one's own where many happy and bright week-ends and holidays may be enjoyed, with the distinct advantage of knowing that your health resort is absolutely your own and cannot be raided by noisy trippers.

Let us take, for example, a busy City man, who, by the time Friday evening comes, is exhausted with his efforts of the week, possibly supplemented by City dinners and other ponderous gaieties. As a rule, his sole desire is to escape from them all. If he follows his inclinations and happens to be a family man, it means leaving the olive branches from Friday till Monday as temporary orphans, like ships without rudders or sails, to drift their own sweet way, and thus engendering the utter absence of real domestic home life. Individuals such as we have described, whilst cursing the noisome motor in one breath may welcome it as a blessing in disguise—as a means of preventing the disuniting of a family circle.

We hold no brief for the motor-car itself, but we cannot fail to admit its usefulness in bringing within the reach of many the delights of the simple or country life which to gentlemen a few years ago were an impossibility. Moreover, the car, in our opinion, is destined to prevent the vandalism which inevitably occurs in rural districts by the innovation of railways, and this alone is something which should earn the gratitude of all lovers of nature.

We have thought it a fitting opportunity at this Eastertide to fill our pages with designs for country cottages and residences varying in cost from 350*l.* to 5,000*l.*, believing they would be of interest to many of our readers (motorists and otherwise) and the public generally. The drawings reproduced have been kindly placed at our disposal by Messrs. ERNEST RÜNTZ & FORD, of the Old Church House, Lewes, Sussex, and of 10 Walbrook, London; and although plans are not given the accommodation contained in each house is detailed in the following description:—

Design for a Kent County House.—Billiard hall, library, two other reception-rooms, kitchen, scullery, dairy and usual offices, six bedrooms, dressing-room, bath-rooms, &c.

Well Green, Kingston-by-Lewes.—Hall, library and billiard-room, three reception-rooms, winter garden, kitchen, scullery and domestic offices, ten bedrooms, dressing-rooms, two bath-rooms and offices.

House at Hythe, Kent.—Hall, large reception-room with dining recess, kitchen, scullery and domestic offices, five bedrooms, bath-room, &c.

Cottage Residence, near Lewes, Sussex.—Hall, two reception-rooms, kitchen with scullery recess, domestic offices, three bedrooms and bath-room.

Cottage Residence, Kingston Road, Lewes.—Hall, two reception-rooms, kitchen, scullery and domestic offices, three bedrooms, three attics.

Proposed Cottage Residence for Lewes.—Hall, two reception-rooms, kitchen, scullery and domestic offices, five bedrooms, bath-room, &c.

Entrance Lodge, Well Green by Lewes.—Hall, one reception-room, sitting-room with bed recess, one bedroom, scullery and domestic offices.

Farm House, Tenterden, Kent (remodelled).—Hall, two reception-rooms, servants' hall, kitchen, scullery, dairy and domestic offices, five bedrooms and bath-room, &c.

Cottages, Southover, Sussex.—Hall, three reception-rooms, kitchen, scullery and domestic offices, six bedrooms, bath-room, &c.

House at Crowborough.—Hall, two reception-rooms, kitchen, scullery and offices, eight bedrooms, nursery, dressing-room, bath-room, &c.

Week-end Residence, Hythe.—Hall, two reception-rooms, kitchen, scullery and offices, six bedrooms, bath-room, &c.

House on the South Downs.—Hall, three reception-rooms, billiard-room, kitchen, scullery and offices, large court in rear, six bedrooms, one bedroom with dressing-room, bath-room, &c.

House at Sutton.—Three reception-rooms, billiard hall, kitchen, scullery and offices, eight bedrooms, one dressing-room, &c.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. A. Needham Wilson, vice-president, in the chair.

Three new members were elected—Messrs. R. F. Chisholm, W. Charles Steljes and H. M. Pett.

The Chairman proposed a vote of thanks to the Royal Institute of British Architects for its sixteenth annual grant towards the educational scheme of the Association, the motion being carried by acclamation.

House List, 1907-8.

The following gentlemen have been nominated for election to hold office during the next session:—President, Mr. Walter Cave; vice-presidents, Messrs. Arthur Keen and H. Tanner; council (nine to be elected), Messrs. L. Ambler, R. Frank Atkinson, R. S. Balfour, F. D. Clapham, C. Guy Dawber, Theodore Fyfe, K. Gammell, J. S. Gibson, V. Curtis Green, H. A. Hall, F. Lishman, P. W. Lovell, Alan Potter, S. J. Tatchell, Stanley Towse, A. Needham Wilson, E. W. M. Wonnacott and Sir A. Brumwell Thomas; hon. treasurer, Mr. H. T. Hare; editor of the *A.A. Journal*, Mr. Baxter Greig; hon. librarian, Mr. Edwin Gunn; hon. secretaries, Messrs. C. Wontner Smith and Maurice E. Webb; hon. assistant librarians, Messrs. T. W. Watkins and Percy May; hon. solicitor, Mr. W. H. Jamieson.

Mr. EDWIN T. HALL read the following paper, illustrated by plans and lantern slides, entitled:—

Sanatoria for Consumptives.

He said:—The subject of sanatoria for the treatment of those suffering from tuberculosis is one to which great attention is being given throughout the United Kingdom by public authorities, because it is now realised that only by organised effort all over the country can any good be done to stem the advance of this disease. In an association of architectural students we have not to deal with the medical side of the question, still less to treat of the statistics of death. The practical question for us to consider is, given the necessity for sanatoria, how can we best provide the buildings to accommodate the thousands of patients who will have to be treated. It seems to me that the elucidation of this problem will be furthered if we see what has been done by other nations as well as by our own, and so I have endeavoured to collect plans and other particulars of sanatoria in Germany, Sweden, Holland, Switzerland and France, as well as some in England. To Germany is, I think, due the earliest recognition of the duty of the public to stem the growth of tuberculosis, the effect of which is to lower vitality, deteriorate the race; and all over the German Empire there are hospitals and sanatoria in large numbers, subsidised or constructed by various States and by insurance companies, as well as those carried on by private enterprise. I shall exhibit on the screen a map of Germany, showing existing sanatoria, which will more forcibly illustrate what has been done than any words of mine.

Before, however, coming to the display of plans, I will ask you to note that in practically all cases elevated sites are selected with open prospects, broadly speaking towards the south; that shelter from the northern half of the compass is sought, and that extensive areas for exercise are regarded as of great importance. Or, putting it in other terms, dry sites for building at bracing altitudes, aspects with the maximum of sunlight for patients' rooms, protection from chilling winds and sleet and open-air living are regarded as essentials for the reinvigoration of the invalid, the broad prospects are mentally stimulating, widening the interests in life and inculcating hope in the future. In woods as a screen are much appreciated for their exhilarating resinous aroma, and the sandy soil on which they thrive is considered the best on which to be located.

As to the type of building selected for patients, you will recently note that there has been an evolution in this. The earliest sanatoria were ordinary houses; indeed, as is attested, patients were at first treated in what came readiest to hand. Given the essential requisites of location, all that was sought was a place in which patients could sleep; disciplinary treatment was relied upon for the rest. A reputation for the cure being once established the buildings became larger as demands for accommodation increased, and many houses grew into hotels. Of such a type is the sanatorium in the Taunus Mountains, near Frankfurt, and the one at Rhodé, near Cologne. An examination of these plans will show that they have in parts a central corridor, with rooms on each side, common to most hotels. Gradually the

development of the sanatorium has led to a type with a corridor on the north and rooms on one side only, and of these we shall see many examples. Another branch of development has been the aggregation of small houses, first by the natural process of the acquisition of adjacent buildings, and later by a deliberate scheme of constructing small houses on the village principle, with central administrative buildings. The natural aggregation may be seen in Dr. Walther's colony at Nordrach, in the Black Forest; the artificial village may be seen at Montigny, in the North of France; and there are several in America, all for paying patients. A third type is the large hospital with wide verandahs on the south side of wards, where the open-air treatment is practised by placing couches on the verandahs, and on these the patients are reclined for eight or ten hours a day. As an example, I may cite Harlaching, near Munich. Another ramification of the same idea, even with buildings specially erected as sanatoria, has been the construction of what in Germany are called Liegehallen, or reclining halls. These are generally one, but sometimes two-storeyed verandahs enclosed on three sides and open to the south, sometimes attached to, but often entirely separated from the building proper. They are very general in Germany, but I think this arises to a great extent from the design of the sanatorium itself. Most of these buildings on the Continent are of three or more storeys in height, as though the military idea of a barrack was the motive of the design adopted, and as experience taught the managers that the patient must come out of his nightly domicile and could not be going constantly up and down stairs, provision had to be, and was, made for his resting during the day in shelters in the open air.

Hospitals are necessary for any advanced stages of consumption, but sanatoria are more particularly intended for, and are more successful with, early-stage cases of pulmonary tuberculosis. While, therefore, a hospital of three or four storeys may be justified where sites are limited or concentration is considered imperative, sanatoria are better of one or two storeys with verandahs on the ground floor, and with such a type the Liegehallen are, I think, unnecessary. I believe, too, that the medical view is gradually coming to regard the treatment of keeping these patients lying down for many hours at a time as prejudicial to any permanent recovery and conducive to idle habits, and is in favour of regular and regulated exercise and employment, as in every way—physically and morally—better for the patient, and as educating him to become a more useful member of the community. The results obtained on these lines by Dr. Paterson in the Brompton Hospital Sanatorium at Frimley are most satisfactory, and should exercise an influence on treatment elsewhere.

From the sanitary building point of view, the long central corridor, with rooms on both sides, is not to be commended for patients, and even with one corridor sanitarians recommend that there should be ample windows in the outer wall of the corridor with corresponding openings in the walls of the rooms so that air may blow right through. Of the relative merits of one or two storeyed buildings this much may be said—the one storey is the easier and better for patients; the two storeyed, in a large institution, gives better concentration for the staff. The former in a permanent building is the more expensive when foundations, roofs and sanitary apparatus are taken into account.

There are many advocates of the cottage type of sanatoria as tending to greater classification, but that is an argument only of weight where other than first-stage cases are dealt with. Of course the cottage has its advantages for paying patients, because greater privacy can thus be secured.

Much is heard of the chalet type, or wood hut for a single patient, and its trifling cost as compared with a permanent sanatorium, but the two cannot be fairly compared. It would be as reasonable to compare the cost of a soldier's camp of tents or huts with that of a dépôt barrack—the one is temporary, the other permanent.

The wood hut is primitive, and although medical skill may in any individual case produce as good results in the one institution as in the other, the essential difference remains so far as buildings are concerned.

The permanent sanatorium is replete with the latest outcome of civilisation—electricity generating station for lighting and power, hot water and heating installations; an elaborate system of drainage, a laundry full of machinery, engine and boiler-houses, an expensively fitted kitchen and large stores, permanent residences for medical and nursing staff, recreation and dining-rooms, laboratories for research, mortuary and post-mortem rooms. Its bath-rooms, closets

and other similar accessories are, to meet modern requirements, built with glazed bricks; the angles of all rooms are rounded, and other expensive finishings are required by the medical staff. Such an institution is as costly as a private mansion of similar extent would be.

Two essential details in design are (1) that all windows or other openings shall be carried up to the ceiling, so that all parts of the rooms and corridors may be scoured with fresh air; (2) sanitary apparatus should be external to the building. I think with such provision a minimum of 1,000 feet for a single-bed ward is sufficient, and 9 to 10 feet is ample for height in such wards. Single-bed wards should be the rule, but two and three-bed wards are useful. In a hospital where all kinds of cases are taken it is different, and in these wards of eight to twenty beds are found. Floors should not be laid direct on the ground, but should have a ventilated space beneath. In rooms where windows are practically always open no ventilating flues are necessary. In the designs which are exhibited it will be seen there are great varieties of plan. Some buildings are straight; some are T-shaped; some are crescents; some are like an inverted U, the centre straight, the arms opened out at angles from about 110 degs. to 160 degs.; some are cruciform. For moderate-sized sanatoria, say under fifty beds, I should give the preference to the open U plan. Care should be taken not to put too large a number of patients in one block or pavilion, because of the danger from a large fire. If the building is more than one storey in height there should be, as far as practicable, no way by which the vitiated air of the lower storey may ascend to the upper one. I think the time has now come when we may profitably study the large number of buildings which will be shown on the screen. Beginning with Germany, we have Beelitz, near Berlin, designed by Herren Schmieden & Boethke, illustrated by four slides, a large scheme, consisting of twenty main buildings and many smaller ones. The main pavilions are two-storeyed, E-shaped and patients' rooms generally face south. At present accommodation is only provided for 308 patients. Belsig, near Berlin, of which a view and a plan are shown, is for 125 patients. The building illustrated is a long two-storeyed building with axis east and west, the centre being recessed, the whole forming an interesting and picturesque group. Badenweiler, of which you see a view and plan, is four-storeyed and in plan an inverted T, the base, with east and west axis, containing the patients' bedrooms, the perpendicular block containing the public rooms, &c. Meschede, shown by three slides, is again a four-storeyed building with other rooms in the roof. On plan it is a crescent with southern aspect and provides accommodation for 114 men. Albertsberg, designed by Professor Tscharmann, of Dresden, for 121 men, is a large building with a main corridor running east and west, with pavilions at right angles, those on the south side forming single wards of ten beds, each lighted on three sides, with Liegehallen between them. Those on the north side face east and west respectively, and contain on one floor six wards of three beds each, and one at the north-east of six beds. The public rooms are in the centre, the dining-room connecting the main building to another parallel block at the rear. Edmundsthal, designed by Herren M. Haller & H. Geissler, of Hamburg, of which I show the block plan and a plan of one floor of the main building for men. This is roughly H-shaped; the front block has two end pavilions, with windows on three sides, for twenty beds each, connected by a corridor having a Liegehalle on its south side. A large central dining-hall connects this block to a parallel one at the rear, in which are four-bed wards with their own balconies. There are other pavilions for women and children. Schreibershaw, as seen by three slides, is again a lofty building, the rooms in the centre being in single file, those in the side blocks being in double file with a central corridor. Melsungen, another lofty block, forming a very flat crescent, with centre Liegehalle on the upper floor and large dining-hall behind. The view shown on the third slide is very interesting from its extent, and as illustrating my observations regarding prospect. Falkenstein, of which the plans are shown, near Frankfurt, is four storeys high. The nucleus of this sanatorium was a large private house, and its kitchens and offices are in the basement. It has accommodation for 120 paying patients of either sex, with 70 single and 25 two-bed rooms. Its plan has the public rooms in the centre, with an east and west axis, and two wings with axes south-south-east and south-south-west. It will be seen that there is a central corridor with some bedrooms facing

west, north-west and east-north-east. Ruppertsheim, near Konigstein, is three storeys in height, the main building crescent in plan, as seen on the screen. It contains 100 patients' beds, all facing towards the south—nine beds for men, thirty-two for women. There are 6 single-bed wards, 17 four-bed and 18 one-bed wards, in single file south of a well-ventilated corridor. The annexe has further accommodation. The Volksheilstaatskrailung, near Planegg, in Bavaria, designed by Herr Michael Dosch, is for 120 patients. The slide shows that it has a central block with east and west axis and two wings with east-south-east and south-south-west axes. There are thirteen single-bed wards, fourteen of two beds, six of three beds, two of four beds, six of five beds and two of six beds, but more beds are occasionally used to accommodate the maximum number. This is well planned, and is surrounded by pine woods, which, however, rather hem it in. Harlaching, near Munich, designed by Herr Hartwig Egger, is a large hospital for 212 patients. There are six wards, twenty beds, six of twelve and some with single beds. The building is E-shaped on plan, with the axis of the main block east and west, the arms north and south. In the main block the long wards are lighted from north and south, but the south side is shaded by balconies or Liegehallen of solid masonry, 12 feet wide. This hospital is not exclusively for consumption. It will be noted in most of these German sanatoria that the sanitary arrangements are most imperfect. Frequently, water-closets are in the heart of the building, in some cases three being in one room, lighted and ventilated by only one window, and having a door of access to the main passage. Sinks and lavatories are as badly placed.

There are, of course, many sanatoria in Switzerland, but I am only showing by four slides that of Schatzalke. It will be seen this is a long parallelogram of four storeys with a central corridor from end to end. The principal floor is largely appropriated to the public rooms. In Sweden we have at Stockholm the large consumptive hospital designed by Mr. Wickman, by whose courtesy we are enabled to study the drawings kindly sent to me. It is a large building, ultimately to consist of eighteen blocks of buildings, containing in all 1,248 beds. Its architect speaks of it as a hospital for treatment of consumption generally. There are three principal buildings, containing 384 beds in each, and these are in groups of eight to a ward. All wards are in single file, the corridor behind being wide and well ventilated. There are three staircases and there is a cloak-room on the ground floor, a very useful accessory. In another building there are forty beds, wards of two beds each. Two summer pavilions have twenty-eight beds in each. At Osterasens, the sanatorium designed by Mr. F. Lilljakviet consists of one group of buildings, containing 104 patients' beds. In the centre the administration, connected by four bifurcating arms, four parallel pavilions of one storey each, containing twelve 6-bed, two 4-bed, two 2-bed and two 1-bed wards. I venture to think the defect of the plan is that the rear block looks on to the back of the front ones. Halahults Kronopark, designed by Mr. A. B. Kumlien, contains on three floors 102 patients' beds, with a central administration, having its axis north and south, and two wings facing south-east and south-west—one for men, the other for women. There are eighteen 4-bed wards, the others being for two beds and one bed each. In addition to this main building, there are seven other buildings, including two summer pavilions grouped around the front and largest. The next slide shows a design for a fifty-bed pavilion. Its general scheme of plan has a central block with axis east and west, and patients' rooms in wings having their axes east-south-east and west-south-west, a type corresponding to that of Planegg, with Liegehallen beyond the wings. This has eight four-bed wards, eight two-bed and two one-bed wards. Here is another Swedish design for a sanatorium of twenty-five beds with an L-shaped plan. It has four four-bed wards, four two-bed and one one-bed ward. Here we have another for twelve patients. In Holland I am able to show the sanatorium of Oranien-Nassau Oord, designed by Mr. R. Kuipers, which is a semicircle on plan, with rooms in single file and Liegehallen at intervals, forming a part of the design. It provides accommodation for patients on two storeys, the wards facing south, east and west. There are excellent public rooms, the dining-room having windows on all sides. The picturesque grouping is shown in the view. Hoog-Laren, designed by Mr. Ed. Cuypers, of Amsterdam, is a sanatorium for the city of Amsterdam. The building, of which the ground and first floors are shown, is straight

th a central corridor. The ground floor contains the ministration and the patients' recreation rooms. The st floor contains eight single-bed wards, two four-bed ards, two six-bed wards, and two isolation wards of single ds, opening on to a central balcony. The dining saloon d offices are at the rear, and a corridor connects the two ocks.

France.—The Sanatorium d'Agincourt (Oise), designed M. Balouet, stands in 320 acres of grounds, and when mpleted will have 328 beds in two patients' blocks. It ll be seen that it differs in plan from any I have hitherto own. It is, from a hygienic point of view, admirable in rangement. Some of the administrative buildings lie on axis north and south. To the right and left, near the rthern end, are two others, while right and left of the uthern end are the detached patients' buildings. Each of ese has a base with axis east and west, and wings with es south-south-east and south-south-west. Each block ntains 164 beds in four wards of eight beds, twelve ve beds, twelve of three beds, and eighteen of o beds. On the ground floor a galerie de cure, the uivalent of the German Liegehallen, extends all around e southern three sides of the enclosing building. A ss corridor connects the building to the dining-hall. Hauteville (Ain) is a sanatorium for the city of Lyons, at altitude of 3,000 feet, containing 110 beds in three blocks buildings (two storeys high with a basement), disposed an arc of a circle open to the south-west. A special oratory is provided for the study of the disease. The rds are of one, two and three beds each. The baths, ndry, disinfectory, kitchens and dining-rooms are in the ement, a scheme open, I think, to grave objection. ntigny-en-Ostrevent (Nord), designed by Professor Calte of the Pasteur Institute, is of the cottage type. It sists of a series of pavilions or houses, each for two ilies, one of whose members is suffering from tuber- osis. Another block is for contagious cases, and there laboratories, &c.

In England there are three sanatoria of 100 beds each, ich I mention in chronological order.

Heatherside, Frimley, in Surrey, belonging to and built the cost of the Brompton Consumption Hospital, for e free treatment of the poor, designed by me; that t Northwood, Middlesex, belonging to the Northern Con- umption Hospital, similarly for free treatment of the r, the gift of Mr. Rudd, designed by Mr. Wheeler; y the King's Sanatorium at Midhurst, the gift of Sir est Cassel, Bart., for paying patients, designed by Mr. cy Adams. Frimley is two storeyed with a central lk, having its axis east and west, containing the admini- tive offices, public rooms and twelve beds for patients equiring special attention, and there are four radial eilions containing each twenty-two patients' beds. As as I am aware this is the only sanatorium of such a ye. Every ward has a clear and undisturbed view of the n country, and the exterior has been designed to get ay from anything like the appearance of a hospital and aier to suggest a comfortable home. All wards are in gile file, facing south, south-south-east or south-south- wt, with corridors on the northern side and windows in vls and partitions for through currents of air. The end v of each pavilion is projected so as to afford shelter to h others from flanking winds, and there is a wide paved eace to the south, so that patients' beds may be wheeled ou. In lieu of fixed verandahs, to which there are objec- ics, there are rolling sunblinds available for shelter from h sun, but dispensable when there is no sun. The wards ar forty-eight of one bed, eight of two beds and twelve of he beds. The sanitary apparatus is all in detached oers. To the north of the patients' building are grouped h administrative buildings and recreation hall, and it has er sought to give all these the maximum of sunlight and i Northwood.—This is not strictly a sanatorium but a ountry branch of the Mount Vernon Hospital. It provides or 114 patients, fifty-seven of each sex, and there are ten es in most of the wards, but there are twelve single-bed vards. Its plan of the main building has a small base, ang east and west axis for officers, and two wings two teys high, east-south-east and west-south-west, with a ie paved terrace on the south. The administration is to h north. The general design is very pleasing in ap- eance. The King's Sanatorium at Midhurst.—This contains 100 single-bed wards in one large building, three teys in height in the centre, two storeys in the wings. Al the rooms are in single file facing south, south-south- ea and south-south-west, with corridors to the north of

them. The dining-hall, connected by a corridor, is to the north, and the administration and staff homes are in the west wing of this same block, the kitchen, &c., forming the east wing. Mr. Adams was fortunate in having a large sum of money at his disposal, and his open-air chapel is one of several novel and interesting features. Next in size is the Pinewood Sanatorium of sixty-four beds, designed by Mr. Jones for paying patients. It has a central administrative block and two detached two-storeyed wings, each containing thirty-two single-bed wards in single file, facing south-south-east and south-south-west. The dining-rooms, offices, nurses and servants' quarters are to the north.

Design for private sanatorium.—This is a design of my own for a small private sanatorium of twelve beds, prepared for a conspicuous position where economy is not the ruling factor. It contains a small private chapel and adequate staff accommodation for so small a building. Infirmary wards.—It may be interesting to guardians who own large infirmaries to show plans of the consumption wards and provision for open-air treatment on the roofs of four pavilions, designed by me as part of the Camberwell Infirmary, where the medical results obtained with consumptive patients are most satisfactory. I have not treated of the cost of the various sanatoria, because a comparison between cost in various European countries is almost impossible, the rates of wages and price of material differing very largely. In England, again, so much depends upon the character of the institution, as stated in my opening remarks. A cubic basis of cost is again illusory, because manifestly rooms of large cube are cheaper per foot than those of smaller dimensions. The cost per bed is that usually adopted, and this has varied according to the type of design, the scope of the institution, the locality, &c., but for high-class permanent sanatoria the cost has ranged from 350*l.* to 600*l.* per bed, and even to over 1,000*l.* Now it is objected that the cost of all these institutions does not meet the want of sanatoria to be constructed all over the country for the million—in the literal sense—and it has been said that architects have yet to solve the problem of a design that can be carried out for complete institutions of varied size to suit local wants at a cost that shall commend itself to the guardians of the public purse. Huts, on the one hand, are cheap enough, but are very temporary, and the maintenance is considerable. They have also special fire risks in wooded districts. At the other extremity is the solid building. I have been giving a great deal of thought to the solving of the problem, and this has eventuated in the designs which will now be placed upon the screen. The enclosing material, including that for floors, is non-combustible and impervious to rain and vermin. It is made in dry slabs of standard size, which are practically universal in application for the unit.

A sanatorium on these lines, complete with all essential administrative buildings to suit any required number of beds, with drains, fittings to kitchen and laundry and water storage, can be erected on a suitable and reasonably accessible site at a cost of about 85*l.* to 105*l.* per bed, depending on its size. I call the design the standardised expanding sanatorium because if a small institution erected on these lines requires to be extended to meet growing wants, this can be readily accomplished by adding units to the wards and administration. As examples of what may be done are shown one sanatorium of sixteen beds with its appropriate administration to cost about 1,680*l.*, one of thirty-two beds to cost about 3,170*l.*, and one of forty-eight beds to cost about 4,080*l.* Now it should be said at once that these buildings do not pretend to compete with the large permanent sanatoria illustrated and described. Those have their place. They are the central institutions and places of research.

My aim has been different. In June 1905 a profitable discussion of the whole subject took place in London, and Dr. Heron, in the course of his remarks, said:—"All poor consumptives should be sent into sanatoria for their own sakes and for the sake of the healthy community. This could not be done if sanatoria were built costing about 200*l.* to 800*l.* per bed. A sanatorium well equipped for the service of the poor should not cost more than 80*l.* per bed."

I venture to express a hope that my application of his remarks will meet the want there expressed. The buildings suggested have in them nothing in common with the temporary wood hut or galvanised iron buildings with timber construction and cavity walls and roofs. They have solid thin walls, roofs and floors, with no cavities. They have smooth internal surfaces, avoiding the expense of plaster or wood covering. These surfaces may be left bare or may be

distempered or painted. The drainage is taken to be for soiled water only, which, if no sewers are available, would be taken into cesspools, as at Nordrach, and emptied by closed suction-carts. A water supply is assumed of course to be available, either from public mains or a local pure stream or other source. Fireplaces in all rooms are provided to avoid the great expense of an engineering plant. A gas supply is required for heating bath water by geysers and gas or oil may be used for lighting. All the joinery required can be prepared in labour centres and carted on to the site ready for immediate erection.

It will be noted that in all cases the sanatorium is divided into units of eight beds, each unit containing six wards with single beds and one with two beds. With a total of only sixteen beds it is assumed that the medical work will be done by a non-resident physician, the patients being in charge of a qualified matron with nurses. With thirty-two patients, a resident doctor is provided for in addition to the matron, and the nurses and servants are increased. With forty-eight patients quarters are provided for two medical men, a matron and an assistant matron or housekeeper, with a large staff of nurses and servants. A small consulting-room and a waiting-room are also provided in all these sanatoria. All the buildings are one-storeyed. All patients' rooms face south-south-east or south-south-west; all staff rooms face either south or east and west, so that all get ample sunlight. All rooms are approached by corridors or covered ways, protected from rain. All patients' rooms have glass verandah shelters on the southern side. The open-air treatment is fully adopted.

In conclusion, I have to thank the following gentlemen for their great kindness in enabling me to show so many and varied plans, both on the screen and the wall:—Herren Muthesius, of Berlin; A. Schmahl, of Frankfurt; Ed. Cuypers, of Amsterdam; Roelof Kuipers, of Gravenhage; Gustof Wickman, of Stockholm; M. Lucien Bechmann, of Paris; Messrs. F. Wheeler and F. Jones, of London; and Mr. Percy Adams, who has also kindly lent me some of the German slides. I know you will appreciate this courtesy on the part of all, as it has added so much to the interest of the evening.

Colonel GERARD CLARK formally moved a vote of thanks to the author of the paper. He concluded the prices Mr. Hall had quoted for cheap sanatoria did not include furniture.

Mr. HALL said the figures he put forward would only cover the cost of building.

Dr. H. T. BULSTRODE, who seconded the vote of thanks, said he was very sorry that his official capacity as inspector to the Local Government Board prevented him from expressing any decided opinion on the subject under discussion. He had considerable sympathy with the attempts made to provide sanatoria for consumptives on cheaper lines. The reason why Germany was covered by sanatoria was that all working men there earning less than 100l. per annum had to insure against sickness and death. To safeguard their own interests the insurance societies therefore prepared to combat disease, and immediately consumption became manifest the patient was sent away by the societies to one of the sanatoria for treatment. Dr. Bulstrode said it was very generally believed that consumption was on the increase. As a matter of fact, the disease had been dying out in England for the last fifty years, and there was every reason to believe if the decrease in the number of cases continued that in the course of thirty years consumption would be as rare as leprosy.

Dr. LYON said the paper had gone through every possible point in regard to sanatoria, but he wished to make a few remarks which would be of interest to architects. He thought a great deal too much time was spent in selecting sites for such buildings, quoting as an instance the King's Sanatorium at Midhurst. Two years was taken up before the site was chosen, and although they had there the ideal pine trees and the ideal prospect, yet the atmospheric conditions throughout the whole year were not the best for consumptives. In speaking to a society of architects he thought he would be allowed to suggest that in the building of sanatoria architects should understand the doctor's point of view. In that respect they should remember that in an ordinary hospital all cases of phthisis showed better improvement when the patients were exposed on the balconies in the wards; the walls were an obstruction to the air that was necessary for them. Dr. Lyon suggested that the ideal room for consumptive patients would have three open sides so arranged that the amount of air flowing through it could be regulated. As a matter of fact, he

believed nothing more than four posts and a roof was necessary. The size of the room was absolutely a matter of aesthetics. Rooms should be as small as possible, for should be remembered that the bigger the room the higher the cost of the building. There seemed to be a great waste of money in the construction of such buildings, many of which, Dr. Lyon said, could be compared to palaces, where a consumptive person needed no better housing than that afforded by a shed.

Mr. W. A. FORSYTH said he had for some time past been interested in the subject of sanatoria, and he had come to the conclusion that they suffered from too much architecture. A sanatorium did not need to be equipped like an hotel, though perhaps something more than four posts and a roof were necessary.

Colonel GERARD CLARK said there was no doubt that nothing could be done for the poor suffering from consumption until cheap sanatoria were built. It seemed absurd to erect expensive buildings that kept out the air, the germ-essential in the cure of the disease.

The CHAIRMAN, in putting the vote of thanks to a meeting, said it had been interesting to him personally to see that architects were doing their share towards combating the dreadful scourge of consumption. He ventured to think that from the examples they had seen on the screen the foreigners had very little to teach English architects in the planning of sanatoria.

DECAY OF MEDIÆVAL GLASS.*

MEDIÆVAL glass, as you are aware, decays in a very characteristic manner. Very commonly the glass becomes covered with little pits, for all the world like the worm-holes one often sees in an old oak cabinet; the appearance is, however, too well known to you to need description. The reason for this peculiar behaviour seems to have been often speculated upon but rarely inquired into. The pitting of the surface has been likened to smut, and I remember a few years ago, when some of the York windows were undergoing repair, an alarming account of their condition appeared in one of the daily papers, from which it appeared that this pitting was due to a malignant microbe which started a regular disease through the glass. Of course, this probably originated as a practical joke on the part of one of the artists in charge of the restoration; but I have seen suggestions almost wide of the mark put forward quite seriously and quite recently.

So long ago as 1879, however, a paper was contributed to the Society of Antiquaries on this subject, which, although incorrect in many details and somewhat unnecessarily complicated, gives a very complete survey of the matter. It is much to be regretted that the large number of examples collected together in illustration of this paper were not kept together for future reference, and are now only to be judged by the brief descriptions of them there given.

The process of decay in glass is undoubtedly a parallel on a small scale to the change produced on a large scale by the action of time and weather on geological formations, such as chalk and sandstone—a combination of corrosion and internal change. In fact, to study the decay of glass is to study structural geology under the microscope, to put it metaphorically.

In the first place, glass—especially that made with potash, as all Mediæval glass was—is hygroscopic, attracting moisture to its surface, so that except in a very dry climate it is never perfectly dry, but covered with a film of moisture. This water immediately attacks the surface of the glass, extracting the alkalis from the alkaline silicates, and leaving the silica behind. Of course, this action is very slight, but it is quite possible to demonstrate that it takes place by leaving glass even for a few minutes in contact with moisture.

Allow this process to go on unchecked for year after year, century after century, accelerated by actual exposure to rain, frost and snow, by the presence of acids dissolved in the water, and by continual variations of temperature, and you will find that the effect of the action accumulates until the whole surface of the glass gradually becomes corroded away, as you can see it is in this specimen of glass from Sandiacre. The alkalis being entirely extracted

* From the paper by Noel Heaton, B.Sc., read at a meeting of the Society of Arts on March 13.

om the surface the silica is left behind, and in glass exposed to the weather, as this has been, is washed away. However, the glass is not exposed to actual washing—if it is buried for instance—the silica remains on the surface as a thin film, so thin that like the soap bubble it interferes with the light passing through it, producing that iridescence which is so admired on specimens of ancient buried glass. This is only very rarely, however, and under exceptional circumstances, that Mediæval glass becomes iridescent by corrosion, and this is due to the large proportion of lime it contains as compared with the silica and alkali. On the extraction of the alkali by water this lime is left behind with the silica and forms with it a hard insoluble silicate of lime, which adheres to the corroded surface of the glass, forming an opaque scum or patina, as is also well illustrated by this Sandiacre glass. In some cases this is so marked that the glass appears to be covered with a coat of cement. There are instances of this, for example, in some of the glass from the Sainte-Chapelle in the Victoria and Albert Museum, of which by the kindness of the authorities I was recently enabled to make a careful examination.

This scumming of the glass has given rise to the suggestion, put forward by Winston and others, that Mediæval glass was sometimes coated with mortar when first made in order to imitate decay. I submit to you that mine is the more tangible explanation. I have no doubt that the craftsmen of the Middle Ages were capable of such a thing if it occurred to them, but I think we must give them the credit of being ignorant of modern ideas of faking, and of descending to such mean and unworkmanlike tricks.

So much then for the direct corroding effect of the atmosphere on glass. Side by side with this corrosion of the surface we find that exposure to weather and variations of temperature have another indirect influence, which produces internal change. You must remember that glass is not a definite chemical compound, but an indefinite mixture of different silicates.

It is well known that if glass is kept for a length of time at such a temperature that it is just plastic, its constituents tend to separate out into definite compounds, which crystallise out from them their matrix in the same way as any salt will crystallise out from solution, until in the end the glass changes entirely into an opaque, crystalline mass, generally known as Réaumur's porcelain, because Réaumur conceived the idea of utilising this action to produce articles having a general resemblance to porcelain.

Now it sometimes happens that glass commences to crystallise out in this way whilst it is being worked, from various causes affecting the working of the furnace. The glass-blower's name for this state of affairs is that the glass has turned "ambitty." This accident has been turned to account in the production of a glass called ambitty sheet, with which all glass-painters are familiar; it is very extensively used for domestic plain glazing. The peculiar nature of this glass is due to the presence of numerous minute crystals, which can readily be distinguished with a pocket lens, while the microscope reveals the presence of several distinct compounds with definite crystalline forms.

You see, then, that it does not take much to make glass change its constitution, and what happens in a few hours in the glass is hot tends to take place on prolonged exposure to the atmosphere, with this difference, that when the glass is molten its molecules can freely move about, whereas, when it is cold and rigid such freedom of movement is impossible; in consequence the definite formation of crystals cannot take place and the result of the change is different. What happens is this. In the first place molecules of the same kind tend to separate out from the homogeneous mixture and collect round a point, forming a centre of decomposition. The action, in fact, is just the same as the formation of concretions in sedimentary rocks—such as the formation of flint in chalk—and as you find that these concretions generally form round some object which produces a nucleus, so you generally find that if there is any irregularity, such as a scratch on the surface of the glass, decomposition will proceed along the line of that scratch.

Proceeding from this centre we find the glass decomposing into definite compounds in an ever enlarging circle until it reaches a point at which the strain set up in the glass by this molecular movement results in a crack forming around the area of decomposition, and then the whole area comes away, leaving behind it a little hole or pit in the surface of the glass. These pits are more or less circular in shape, but frequently they grow close together and the glass unite, forming an irregular-shaped hole. The pits

vary in size from microscopic dimensions to a quarter of an inch in diameter, but as a general rule they are about the size of a pin's head. The most remarkable case of pitting I have ever seen is that of some of the York windows, fragments of which have been shown to me by Mr. Grylls, where the pits reach a diameter of over five-eighths of an inch. When pits are forming along a scratch they generally develop close together, side by side along it, and the adjacent sides break down, so that in the end we have an excavation in the shape of a long trough.

This I am convinced is the explanation of the pitted surface of old stained glass. That there certainly is a change in the constitution of the glass is shown by the fact that on digesting glass which has begun to decay in this way in hydrochloric acid, it is possible to extract the whole of the alkalies and earths, leaving a skeleton of pure silica in the form of the original glass, whereas fresh glass of the same composition is not attacked by hydrochloric acid to any extent.

Mr. Williams, who first made this experiment, has obtained the same result with certain varieties of asbestos, which is produced by the devitrification of natural volcanic glasses. Glass devitrified by heat is also attacked by hydrochloric acid in the same way.

With the aid of the microscope one can follow out the whole process of the formation of pits in Mediæval glass in the way I have described, and I now put before you several illustrations of the process and its relation to that of devitrification.

Such, then, are the two forces at work on the decay of glass—corrosion without and decomposition within, and of course they act simultaneously. As the pits are formed they are extended by corrosion, forming a resting-place in fact for the water, until eventually the whole fabric of the glass is destroyed.

According to varying circumstances—the position of the window as affecting its degree of exposure—the climate in which it is placed—differences in composition and mechanical state of the glass—we get all sorts of variations in the precise effect of decay in particular instances.

It is a well-recognised fact that glass containing a large proportion of earths, that is, lime, magnesia and alumina, is specially liable to turn ambitty. If, then, I am correct in thinking that the peculiar pitting of Gothic glass is due to a similar change of constitution, one would expect to find it excessively rich in these constituents, and we have already seen that this is, in fact, the case.

On the other hand, glass containing excess of alkali has an equally recognised tendency to go "blind," that is, to become covered with a film, due to corrosion; the surface of water glass, consisting of soda and silica only, to take an extreme case, becomes roughened by corrosion in a few days. Finally, glass with a high content of silica, with earth and alkali equally balanced, may be looked upon as highly resistant in both directions. It is such glasses which decay slowly and with little tendency to devitrification, the surface being merely etched by corrosion, leaving the large proportion of silica in a coherent thin film, producing gorgeous effects of iridescence.

Of course one must not overlook the fact that apart from composition the mechanical nature of the glass has an influence on decay. Just as a geological formation of regular and uniform nature resists corrosion better than one of varying hardness and character, so a glass of uniform texture resists decay better than one of the same composition but full of variations.

Now I pass on to say a few words about the "colour," as we call it, used to paint on the glass in Mediæval times. If one is struck by the fact that the older the glass is the freer it seems to be from decay, how much more is this the case with the colour? On making a careful examination of the Sainte-Chapelle glass, to which I have already alluded, I found that the painting of the original glass was as sound and perfect as when first put on early in the thirteenth century. Here and there, however, were pieces where the paint had either gone entirely or showed unmistakable signs of decay; but in every single instance careful examination revealed the fact that the glass was an insertion of later work. The most glaring case of this is one of the heads, which no one who has seen this glass can have failed to notice as being later in date than the rest of the glass. Half the paint on this head has already gone, and I would undertake to wipe the glass clean by rubbing it with a damp rag. Possibly the explanation of this may be that all the bad work of the thirteenth century has already disappeared and only the best remains, but there is no doubt

that the Mediæval craftsmen could make their colour so as to last remarkably well.

In this respect, however, I consider they are equalled by the best colours of to-day. But that is not all; there is a peculiar texture about the old colour, a vigour in the very finest lines, and yet a general feeling of warmth and transparency which one has great difficulty in producing to one's satisfaction. Any hint one gets as to the method of production of this colour therefore demands careful investigation.

Now on looking through the various Exchequer accounts, many of which are extant, connected with the glazing of church windows, one is struck by the constant reference to a material called "geet," bought for the purpose of painting the glass—"Geet pro pictura vitri." The actual nature of this material does not seem to have been thoroughly inquired into, and my attention having been drawn to it in course of conversation with Mr. C. W. Whall, I thought an investigation of the matter might possibly prove to be of value.

I now want to put before you what is actually known about this material called "geet" and my conclusions regarding it, and I will begin by showing you a selection of extracts from the accounts I have mentioned:—

"Pro stangno Get et operacione fenestrarum et stipendiis de verrers usque festum sancti Michaelis 32s. 9³/₄d. Pro verre empt., 5¹/₂ os. 2¹/₄d." (Norwich Sacrist's Roll, A.D. 1274-5).

"Die Lunæ ix^o die Julii. Johanni-Geddyng pro vj libris de Geet emptis pro pictura vitri vjs. pro cervisia emptā tam pro congelacione vitri quam pro mensis vitriariorum lavandis viij¹/₂d. Eidem pro lymatura argenti emptā pro pictura vitri viij¹/₂d. Willelmo de Newerc pro cc. Talshid emptis pro vitro anellando et frangendo pretium centenæ vijs.—xiijs. Johanni Madfray pro j. libra de Gum arebik emptā pro pictura vitri iij¹/₂d. Ricardo Thorp pro xv. centenis vitri diversi coloris pretium centenæ xls.—xxx¹/₂l. In portagio et batillagio ejusdem vitri de Temesestreete usque Westmonasterium xd.

"Summa empcionum xxx¹/₂l. ijs. vd."

(Exchequer Accounts, St. George's Chapel, Windsor, A.D. 1351-2.)

"In xij peys vitri diversi coloris empt', xij s. In geet et lymail empt' ad vitrum, iij s. iij d." (Ely Cathedral, A.D. 1357.)

Similar references to "geet" appear in the accounts for the glazing of the windows of St. Stephen's Chapel, Westminster, which Brayley and Britton sum up thus:—

"Large quantities of stained glass of various colours, as blue, red, azure and white, were used in glazing the windows; and silver filings, geet [probably jet] and arment [orpiment or yellow arsenic], are mentioned among the materials procured for painting on the glass."—"History of the Palace of Westminster," p. 180.

To come to a later date, we have the "Booke of Sundry Draughtes," by Walter Gedde, 1615, wherein we read:—

"The Receipts, for the true making of Colours for Glasse. To make a faire Blacke. Take the Scales of Iron & Copper, of each a like waight, & put it in a cleane vessell that will indure the fire, till they be red hotte, then take halfe as much leate, and stamp them into smal pouder, then mix them with Gumwater, & grind them fine vpon a painters stone and so drawe with it vpon your glasse."

And again:—

"Carnation.—Take two ounces of Tyn-glas, and six ounces of leat, half an ounce of gum, ten ounces of red Ocker, and grind them very well together, and so use it."

"To Make a Grey couller, take Iron scales, a little Cristall, and sum smale quantitie of leate, grind these well together upon a painters stone, the more leate ye take, the sadder the coullour will be, and likewise the more christall you put to it the lighter."

From the middle of the thirteenth century to the beginning of the seventeenth century we find this substance "geet" in use. It is true, however, that the treatise of Theophilus, which would be somewhat earlier than any of the dates quoted, makes no reference to it, but states that the colour is to be made of copper scales, green glass and "Greek sapphire" in equal proportions. (Book II. Chapter xix.)

The extracts quoted undoubtedly convey the impression that "geet" must be taken to mean jet—an impression strengthened by the fact that the word "geet" is constantly used by Mediæval writers, wherefrom the context jet is undoubtedly referred to. Hence we find that from Brayley

and Britton to the present day it has been taken for granted that the Mediæval glass painter painted his glass with ground jet. But the point is not the name they gave to their material, but what it was. Was this stuff they called jet what we mean by jet at the present day? On the face of it, to a practical man it seems improbable. Let me give you a short account of jet condensed from various authorities.

The name "jet" is supposed to be a corruption of "gagates," the name given to this substance by Pliny, who described it as found near the mouth of the river Gagas. The hardest and therefore best jet is found principally at Whitby and Robin Hood's Bay.

Its use appears to have been known in this country from a remote period. It frequently occurs amongst the relics found in ancient British barrows and in Roman and Saxon tombs. It is also frequently mentioned in Mediæval wills and other documents down to the present day.

In composition it resembles cannel coal, but it is harder, blacker, and takes a brighter polish, and, like coal, consists mainly of hydrogen and carbon. It readily ignites and burns when heated, and on dry distillation yields a quantity of dark oil.

Jet, therefore, does not sound a very promising material for use in glass painting; but in such a case as this, whatever theoretical conclusion one may come to, the only really reliable argument is practical experiment. I therefore decided to see what sort of glass colour one could prepare from jet. For this purpose I obtained a number of specimens from various sources, namely:—

1. A lady's hat-pin, purchased from the street vendor of jet at Whitby.
2. Some specimens of jet collected from the cliffs at Whitby by Dr. Andrea.
3. A large piece of unworked jet, obtained from a merchant at Whitby.
4. A brooch and other articles made of jet.
5. Some fragments of Roman jet from Silchester.
6. A number of jet beads.

I made up some pigment with samples of all these different jets according to the recipe given by Walter Gedde; the result obtained was just as I expected in theory. On putting the glass painted with this "faire black" in the kiln the colour ignited and burnt away like tinder, leaving a slight residue behind which could be readily rubbed off the glass with the finger; jet as a material for painting on glass is perfectly useless.

But one may assume that for "geet" we should read the ashes of jet—the residue left after burning, in the same way as wood ashes were used for making glass. In order to test this I made analyses of these specimens of jet, of which the following may be regarded as typical:—

Moisture	1'56 per cent.
Volatile matter	66'15 "
Coke	29'96 "
	97'67
Ash	2'33
	100'00

This ash contained the following:—

Silica, titania, &c.	40'6 per cent.
Iron, alumina and manganese	45'5 "
Lime and magnesia	4'8 "
Alkali	nil. "
Undetermined	9'1 "
	100'0

This is the analysis of specimen No. 3, but the other (with the exception of No. 6, which I shall refer to shortly) yielded similar results. No. 5, for example, gave the following figures:—

Moisture	0'02 per cent.
Volatile matter and coke	97'85 "
Ash	2'13 "
	100'00

Now I put it to you—is it probable that a hundredweight of a material of sufficient value to rank as a minor article of jewellery would be destroyed in order to obtain a couple of pounds or so of material for painting on glass, especially when you consider that the material so obtained would be quite useless for this purpose? As you see, it contains alkali and over 50 per cent. of bases, and would require to fuse it a temperature at which the hardest glass would run like water.

But now I must tell you something—the matter might have ended there. I might have robbed the antiquaries of their beloved jet and left them nothing in its place, only it happened that amongst the specimens of jet I collected from my friends was a necklace of beads supposed to be of finest jet; when I ground up these beads with iron oxide in the same way as the others and put a slip of glass painted with the mixture into the kiln, instead of burning away as I have described, it melted and fired into the glass just as an ordinary enamel colour does, so that my glass came out painted a "faire black." Unfortunately, this was a forgery; it was not jet at all. Analysis showed that it was just an artificial jet made of black glass.

But starting with this material as a basis, and altering the composition somewhat, I could produce a colour which exactly matched the old thirteenth-century colour, and passed all the tests I could devise for permanency. Therefore I make the suggestion that the explanation of "geet" is this, that a glass resembling jet in appearance was prepared especially as a flux for painting on glass, which, mixed with the oxides of iron and copper, yielded the fusible pigment with which the Mediæval glass was painted.

I admit that I have no direct documentary evidence of this. I have searched the records in vain for the slightest hint as to how or where the substance called geet was obtained, but I can mention several points in support of my contention. In the first place, as far back as Roman times we find articles made of black glass and obsidian in imitation of jet. For instance, when I came to examine the fragments of Roman jet from Silchester that I have referred to as being amongst the specimens examined, I found that only one piece was true jet, the others being composed of a dark-green glass with which I could make a glass-painter's colour in the same way as with the artificial jet I have just described. The two materials were, however, so identical in appearance that it was not until I was breaking them up preparatory to analysis that I discovered the difference.

One can readily imagine—of course this is pure imagination—some Mediæval worker making the discovery that a glass made in imitation of jet formed an excellent material for painting on glass, just as I discovered those imitation jet beads. This supposition is the more likely, however, because we have every reason to believe that in the very early days the crafts of stained glass, enamelling and working in gold and precious stones were carried on side by side.

Having once been discovered, what more likely than that the artificial jet should be specially prepared for the glass painters and receive the technical name of "jet"? As a parallel case I would mention blacklead. As far back as I have been able to trace one finds this form of carbon referred to as though it were a variety of lead. Are we then to imagine that antiquaries of the twenty-sixth century, diving amongst the records of to-day, will argue that it was the custom of the period to cover our firegrates with a film of lead because they read of them being coated with blacklead?

Another possible explanation is, that this substance was called jet in the same way as the various coloured glasses were often called by the name of the precious stone they most nearly resembled. For instance, we read in Theophilus—"Tabulas saphiri pretiosas, ac satis utiles in tenebris," tabulas saphiri meaning undoubtedly sheets of green glass.

Then you may perhaps have noticed in the recipes given by Gedde the use of the word "crystal." To make a grey colour he says, "Take iron scales, a little cristall and a small quantitie of Ieate." Now no one ever imagines that "cristall" means quartz, or anything else but white glass; why therefore can we not read for "Ieate" black glass?

One other piece of evidence I can offer you, which is this. If you grind up oxide of iron with a soft white glass, which is a very common way of making glass-painters' colours, the fired glass shows under the microscope a mass of opaque black spots in a colourless matrix.

If, however, you examine Mediæval "colour" under the microscope it appears as a mass of black spots in a deep brown matrix. This also is the appearance presented under the microscope by the colour made up with black glass in the way I have just described; a colour which I have taken the liberty of calling by the name of "geet."

And that, I think, brings me to the end of what I have to say, and I must not detain you longer. Some of you may perhaps question the practical utility of such inquiries as

I have discussed to-night; to such I would say—much has been done of late to revive the craft of stained glass and place it once more in the dignified position it held in Mediæval times, but more remains to be done. The bulk of the work must of course rest with the craftsman, on whom lies the responsibility for æsthetic conception. To such a position I cannot aspire, but the maker of materials can perhaps in a humbler way do his part. It is from this point of view that I have endeavoured to throw some light on the technical problems which face the glass painter, feeling that it is a privilege to be able to be of some use in such a cause.

And now I have only left the pleasant duty of acknowledging the help I have received from so many quarters in preparing this paper. My old friend Mr. Percy Williams really did most of the hard work for me; but it is largely due to the kindly encouragement and assistance of Mr. W. H. St. John Hope that I have been enabled to carry out these inquiries, the results of which I now lay before you.

CHICHESTER GUILDHALL.

A LOCAL guide book, which a visitor found useful in directing his steps about the exceedingly interesting city of Chichester, says of the Priory Park that the castle which stood there "was destroyed in the reign of Stephen 1216," and that the ground was given in 1233 to the Grey Friars of the Order of St. Francis, who erected on it a monastery. "The old building," the account continues, "in the centre of the park is a portion of the monastery church. It is now the town hall of the city, but is never used except on the occasion of elections for the county. There is a fine east window of five lancets, but the interior is only remarkable as displaying the vandalism of the civic authorities who fitted it up as a Court of Justice, for which purpose it was formerly used."

A building with such a varied history, says a correspondent of the *Sussex Daily News*, was thought worthy of inspection, and the pleasant little park was soon reached. But apparently there was some mistake besides that of the date assigned to the reign of King Stephen. Judging from internal evidence the building was rapidly falling into ruin, and any sign about the structure of the business appertaining to the town hall of the humblest place in the kingdom, much less a city of the importance, dignity and activity of Chichester, was conspicuous by its absence.

After some trouble, admission was gained to the interior, and there the puzzle became still more complex. Evidently it had been a church. There was "the fine east window of five lancets," and there also were the sedilia, or seats for the officiating priests, together with other evidences of an ancient and, probably at one period, a very beautiful structure of the Early English and Decorated periods of architecture. So the date and original purpose of the building were quite correct; there was, however, no sign of either the "Town Hall" or the "Court of Justice."

But whether an ecclesiastical or a civic relic, this once fine hall, more than 80 feet long, 31 feet broad and 42 feet high, was in a lamentable state of disrepair; and it seemed a matter for intense regret that another should be added to the many links with the past which Sussex has allowed in comparatively recent times to become broken and ultimately disappear. Some of the original work, and especially the east window, is exceedingly good. It is little wonder, however, that a handbook to Chichester Cathedral, one of a well-known series on the cathedrals of the country, makes no mention of the Guildhall in its list of "ancient buildings in the city."

For explanation as to its present usage reference was made to a local directory, which said "The old Guildhall, and the way thereto, belongs to the Corporation." This only added to the wonder why so valuable a relic of the past, and a building so capable of becoming an object of utility as well as of general interest, was not kept in a suitable state of repair.

Interest in archæology led the visitor to seek for information respecting a building which appeared to have played many parts in the history of the city and the county, and the following is a summary of his search:—

1087.—A castle erected by Montgomery, Earl of Shrewsbury and Arundel, occupied the site.

1208.—The castle was seized by King John and ordered to be demolished, but the order was not carried into effect.

1216.—Writ issued by Henry II. to William, Earl of

Arundel, to forthwith destroy "the castle, with its appurtenances."

1233.—The site was given to the Grey Friars or Friars Minor for a monastery.

1270.—The choir (the present guildhall) of the monastery church completed about this date. The nave had already been built.

1541.—The monastery dissolved and granted to the mayor and citizens of Chichester, "by whom it was let on lease, except the chapel, which they converted into a shire or town hall."

1804.—The property was still held by leasehold tenure under the Mayor and Corporation. "The term of lease," says the historian, is "999 years, but when commencing I have not found;" and, he rightly adds, "nor is it material."

1833.—A local guide of this date records that the guildhall was then used for the trial of offences committed within the jurisdiction of the Mayor; for the Mayor's Court for the trial of issues to any amount between subject and subject; for the Court of Quarter Sessions for the western division of the county; and as the county court for the same division.

Probably some one acquainted with the history of the city would be able to fill in the more material blanks in this short sketch, especially as to its actual use as a guildhall, and as a shire or a town hall.

For more than 170 years Chichester has been provided with a separate institution for civic purposes in the building known as the Council house, but for a long period the name of guildhall appears to have been associated with the older structure. Guilds, or corporations for mutual aid and protection of interests, date back to much earlier times in Chichester than even the building now under consideration. The oldest existing charter of the city was granted by King Stephen (1135-54), "that my burgesses of Chichester do well, and honourably, and quietly hold and enjoy their customs and regulations of their borough and Merchants' Guild as they did in the times of King William, my grandfather;" and the charter granted by Stephen's successor declared that "no person shall sell cloth by retail within the city of Chichester unless he be of the Merchants' Guild."

It was customary for guilds to have a common hall of assembly, and, according to a charter of Richard II. (1394), "the Gilden Hall" of Chichester appears to have been "between the cathedral cemetery and South Street." By that document the said hall was granted to the vicars choral to found their college. There is also a record that the ancient parish of St. Peter hard by was called "St. Peter's juxta Gilden Hall."

Possibly the necessity for a guildhall changed its character or lapsed altogether in the previous reign, when Edward III. made Chichester one of the seven cities in the kingdom with a "Company of the Merchants of the Staple," whose chief purpose was "to collect all that could be spared of the produce of the district in wool, lead and tin, and deposit them in the city that foreign merchants might know where to find them." So important a body, exempt as it was from the jurisdiction of the ordinary magistrates, would most probably have had a hall of its own.

To what extent the building in Priory Park has a right to the name of guildhall in the original signification of the term is not quite clear; but there is no doubt that its popular if not official designation as the guild or town hall of the city goes back a long way. The use of the Priory Park building as the actual meeting-place of the guilds is not, however, of great importance. It is the danger of so interesting a piece of architecture and evidence of social change falling into decay instead of being utilised for some suitable purpose which seems to be so much a matter for regret.

Ailsa Craig.

SIR,—Please excuse me for drawing your attention to an error in this week's (22nd) issue of *The Architect*. On page 185 you say, "Ailsa Craig is a familiar object to those who travel from London to Leith by sea." As Ailsa Craig is in the Firth of Clyde, on the West Coast of Scotland, it is impossible to see it from the East Coast, unless by very

powerful eyes. No doubt you have been thinking of the Bass Rock. Trusting you are not offended at my drawing your attention to this,—I am, yours sincerely,

WM. HALLEY (native of Glasgow).

15 Burton Road, Brixton, S.W.

GENERAL.

A Memorial Tablet is to be erected by the London County Council on No. 39 Rodney Street, Pentonville, to commemorate the residence of James Mill and his son John Stuart Mill.

M. Ch. Widor has been elected a member of the Berlin Academy of Fine Arts.

The Students selected to compete in the final stage for the Prix de Rome in architecture are MM. Abella, Boursois, Deslandres, Janin, Madeline, Mahieu, Nicot, Pons, Tulasne and Villemot.

The Prix Achille Leclère was not awarded last year by the Académie des Beaux-Arts. Two prizes of 1,000 francs each were available this year. The subject selected was a design for a central station on the Métropolitain Railway Paris. On Saturday the winners were declared to be M. Boussois and M. Albert Bray, both pupils of M. Pascal.

The Prix Duc, of the value of 3,700 francs, has been awarded to M. F. Débat for his design, "A Temple of Peace."

The Commissaire of Police for the quarter of the Champs Elysées, Paris, has removed a painting entitled *Lutte Russe Japonaise*, by a Polish artist, from the exhibition of the "Indépendants," on account of the protests of the public.

The Royal Irish Academy have received during the past year several donations to the library. They included a collection of coloured drawings, architectural and landscape illustrative of Ireland, by the late Sir Henry Dryden, Bart. of Canons-Ashby, Northamptonshire, presented to the Academy by Miss Alice Dryden. A volume of antiquarian sketches, by the late W. F. Wakeman, was presented by Mr. Thomas Manly Deane, A.R.H.A.

The Court of Common Council have approved a proposal that expert advice be taken relative to the suggested rebuilding of Southwark Bridge out of the funds of the Bridge House Estates.

The Council of the Royal Academy consists this year of Professor Herkomer, Messrs. T. G. Jackson, B. W. Leader Seymour Lucas, David Murray, W. W. Oules, Britton Riviere, J. S. Sargent, Solomon J. Solomon and J. M. Swan. These, with the President, form the Chantrey Trustees. The hangers for the forthcoming show at Burlington House are likely to include Professor Herkomer and Messrs. Leader, Lucas, Riviere and Solomon.

A Meeting of the archdeacons and rural deans of the diocese of Llandaff was held last week at Cardiff for the purpose of electing two surveyors of dilapidations. Mr. George E. Halliday, of Cardiff, was reappointed for the archdeaconry of Llandaff, and Mr. H. J. Griggs, Newport, for the archdeaconry of Monmouth. They will hold office for three years.

A Report by Mr. Whitie, the architect for the new Mitchell library, Glasgow, states that in order to secure a stable foundation at the corner of North Street and Ken Road, it will be necessary to resort to piling or to put down an extensive system of grillage, involving an additional expenditure. The libraries committee have approved of this.

The Corporation of High Wycombe have accepted an offer from the Ecclesiastical Commissioners, lords of the ancient manor of Bassetsbury, to convey as an open space to the Corporation Keep Hill, which was formerly held as an ancient British fort. The acreage of the land is sufficient to provide for the enjoyment and recreation of a large population.

Mr. Runciman has stated that it is proposed to rebuild the whole of the Regent Street Quadrant as leases fall in on the same design as the building now being erected. The designs are intended to provide for the rebuilding of the whole of the Quadrant as one consistent scheme. The plans were most carefully considered both by the local Government and by the present Government before they were agreed to, and it would be too late now, when a part of the scheme has been almost carried out, to make an alteration in them even if it could be shown to be desirable.

THE WEEK.

IMMUEL KANT, whose name is still pronounced with reverence by German metaphysicians, or, in other words, by the greater part of his countrymen, was a man of decorum and regularity in his death as in his life. His final words in 1804, "Es ist gut," might be said to be a prophecy of all he accomplished. The cloud which was hovering near his house in Königsberg was, according to a poor soldier, the soul of the philosopher on its way homewards, and the remark was approved by his sons and students. His burial was orderly as his life. Sixteen days were allowed for people to do homage to the remains, then there was a public funeral and the coffin was deposited in the vault reserved for the professors in the church of the University. After a few years it was placed apart and not was railed. But in the years which followed, when it was too engrossed with struggling for existence against the French to think about the coffin and its contents, and when about eighty years after KANT's death it was resolved to do him reverence, the problem of the whereabouts of his remains was as uncertain as those discussed in his lectures. All that can be said is that he was buried somewhere in the little church known as the "Stoa Kantiana." At the same time the people of Königsberg consider it is inevitable to be unable to point out a memorial of the philosopher to strangers. There is a tomb of KANT close to the palace, but it is little more than a reproduction of one of the subsidiary figures of the monument of FREDERICK THE GREAT in Berlin. It was proposed to place the memorial in a prominent position in the cathedral, where it would suggest to the extent of equality with Duke ALBERT I., the founder of the University.

It is said to be said that one of the reasons which led to the Haussmannising of Paris was to find employment for workmen who might, if they were at leisure, employ themselves to the danger of the Empire. The decision to build new schools in the city might have been inspired by a similar policy. On Friday last it was proposed in the Municipal Council to raise a loan of seventy-seven millions of francs, or over 3,000,000 sterling, for the building of schools. Having suppressed the Congregationalists, it is necessary to find new buildings as substitutes for those in which they taught. The schools and other buildings belonging to the Orders have been appropriated in a way which does not testify to the financial wisdom of the French rulers, but possibly it is desirable to suggest that the schools were not adapted to the training of the citizens of the future. There was opposition to the proposal. The loan will be repaid as follows:—For infant schools 60,340,000 francs, for higher grade schools 7,730,000 francs, for two "lycées" for girls 10,505,000 francs. The Government has only a first instalment of the sums which will be repaid in Paris.

The Panthéon of Paris has been subjected to experiments which would have amazed SOUFFLOT, the architect. Alternately necropolis and church, M. DUJARDIN-BEAUMETZ, the Under-Secretary of Fine Arts, now is making it "le Temple des Apothéoses." As an experiment, he proposes to hold fêtes which will connect the dead men to whom the building is dedicated with the modern life of France. With that intention professors of the Conservatoire have been invited to prepare hymns which will be suitable to the occasion. M. NENOT, the architect who has charge of the Panthéon, is now engaged in preparing a scheme of decoration for one of the fêtes. A commission has been given to M. SEGOFFIN to prepare a memorial of

VOLTAIRE, and to M. BARTHOLOMÉ for one of ROUSSEAU. Several groups of sculpture are in hand, and M. DUJARDIN-BEAUMETZ hopes that some artist of genius will be inspired to create as the central adornment a great group which will be a glorification of France, and as large as so lofty a temple will allow without appearing to diminish the proportions of the shrine.

THERE can be no question that one of the most effectual ways of making colonists feel there are bonds between them and the mother-country would be by a reduction of postal rates. The Post Office is, however, a most profitable department, and there are objections to any diminution of its receipts. By degrees we may expect to have the reform carried out. But in one sense British literature of the present day, as found in periodicals and newspapers, is an influence hardly less potent than private letters in connecting this country with the Colonies. Yet there can be no doubt that the charge for sending publications abroad is not only excessive, but there are risks of non-delivery which are insufficiently considered. Any excess of weight, which is determined only by the authorities, is enough to prevent the receipt of a newspaper, and in that way an injury is inflicted the origin of which is not easily traced. The Colonial Postage Reform committee are endeavouring to obtain a reduction of postage rates, for magazines and newspapers especially, and their efforts deserve the support of all who desire to see the Colonies and Great Britain knit still closer.

THE city of Buenos Ayres is to be transformed, and the Argentine Government have prevailed with the Municipal Council of Paris to allow M. BOUVARD, the Director of the Architectural Department, to become the principal adviser for the improvement. He set out on his journey last week, and is accompanied by two architects—M. FAURE-DUFARRE and M. DELATTRE. M. BOUVARD can only remain a few weeks in Buenos Ayres, but his visit will be repeated from time to time until the works are accomplished. In 1910 the centenary of the Republic will be signalled by an international exhibition, for which M. BOUVARD's experience in the organisation of the Paris Exhibition of 1900 will be utilised. It is natural for Frenchmen to be gratified by the selection of M. BOUVARD for so important a commission. But when it is desired to have a beautiful city, where is there a better model than Paris, the amenity of which is in M. BOUVARD's charge? It is also gratifying for Frenchmen to know that the Mexican Government have solicited a Frenchman to design important buildings, and the new University of California is also being carried out by another Frenchman.

READERS of "The Forty-Five Guardsmen" will remember the scene of the execution of SALCÈDE in the Place de la Grève. At the last moment he recognised the Duchesse DE MONTPENSIER, who wore a page's uniform. Afraid of discovery she rushed towards the door of a house at the corner of the Rue de Mouton, which closed behind her, and no one else was allowed admission. It is remarkable that in the house in question, which was known as the "Maison de la Lanterne," M. BERTHELOT, the great chemist, who was buried with all the honours which France could bestow on an illustrious son, was born in 1827. The improvements all round the Place in which the Hôtel de Ville stands were fatal to the old structure which was made famous by DUMAS and BERTHELOT. However, a model was prepared of the Place as it appeared in the time of LOUIS PHILIPPE before the alteration, in which the corner house is accurately represented. The model has been preserved and will soon be seen in the wonderful Musée de Carnavalet, with which all lovers of Paris should be acquainted.

FAULTY SPECIFICATIONS.

WHY is it that architects so often write such unsatisfactory specifications? Or, perhaps, we might rather ask how it is that they allow such specifications to be written and to be sent out from their offices? For there is no doubt that the specification is too often written by an assistant or quantity surveyor rather than by the designer of the building. Such vicarious production of an important instrument for the realisation of the designer's conception cannot but result in an imperfect attainment of that realisation. For the deputy writer of the specification obviously cannot know all that is in the mind, or perhaps even imperfectly adumbrated in the sub-consciousness of the designer, and hence develops an inevitable tendency to vagueness and an adherence to traditional precedent. Is not the *modus operandi* very frequently adopted in the preparation of a specification that of utilising as a model one that has previously done service for a more or less similar building, and copying wholesale therefrom clause after clause with possibly only the slightest modification? And most frequently has not the model itself been concocted in like fashion from some still older example? Tracing back the pedigree of the older example, is not the parent of our twentieth-century architect's specifications one that he has copied in his pupilage days from his principal's productions? In all probability his principal's latest example had a similar ancestry, so that the original progenitors of our specifications of to-day first saw the light in many instances away back in the remote past of the eighteenth century.

It is from such blind adherence to precedent that we still find it prescribed that "all the fir timber is to be the best Memel, Dantzic or Riga," in spite of the fact that there are scores of other ports on the White Sea and Baltic coasts from which excellent qualities of timber are daily being sent to England. Again, the builder is told that his joinery is to be prepared from "the best Christiania deal," although it is scarcely possible for him to buy decent deal from that port even if he were to try, which he certainly would not, knowing full well that the writer did not mean what he said, did not know what he meant, and would not recognise what he asked for if he got it. Such stipulations as to the quality of timber to be supplied might have meant something in the days of our great-grandfathers, but now they serve only as indications of incompetence or indifference on the part of the writer. Nor is it only the obsolete reference to ports of origin that casts such stigma. The ever-recurrent word "best" is equally unmeaning. Every builder knows that the highest grade of fir and deal is practically impossible in building, and that any architect who asks for "best" is simply writing nonsense.

Nor does the matter end here. When a specification with such descriptions comes into the hands of a contractor for tendering, what course is he to pursue? The honest builder, being also most probably a reasonably careful man, assumes that a high grade is required; his cut-and-run competitor seeing here a loophole for scamping, is in this part of the work able to price lower. The same thing probably occurs in other matters, and so although the honest man may be content to work at a smaller profit than the other, and may actually put a lower figure on those parts of the work not open to evasion, he is worsted in the competition, the unscrupulous man gets the job, and the employer pays more dearly for what he receives.

It would be a revelation to the writer of such faulty specifications to glance through a sale catalogue of one of our leading wood brokers or to spend an hour in the yard of some of the prominent timber merchants. Thus he would learn what kinds of timber are on the present-day market, and how he should describe the particular kind most suitable for his purpose and most advantageous for his client.

Nor is it only in relation to fir and deal that a man who blindly follows precedent goes adrift. In the case of hard woods also he is hopelessly behind the times. The description of mahogany is probably limited to "Spanish" and "best Honduras." Tabasco is not mentioned by him, and he probably has but the vaguest idea of what it is like. He does not realise that the price of mahogany may range from ninepence to half a crown per foot super, and he is unable to decide what quality is desirable for his client's purpose, or at least he has not troubled to make it clear to the builder. Surely a more satisfactory procedure would be to follow the advice of high-class merchants, and specify "the mahogany is to be obtained from Messrs. So-and-so, whose price is . . ."

What is true with regard to the specification of timber applies also no less forcibly to stone. "All stone is to be the best of its respective kind." "All steps are to be rubbed York stone" of such and such size. One might imagine that all the stone in the county of broad acres was of one kind and of one quality. That Dewsbury and South Oram, Huddersfield and Robin Hood, Scotgate Ash and Bramhall Fall are all one and alike. That there is no distinction of hard and relatively soft stone in Yorkshire or even that there is no difference between one variety of "hard York" and another.

As with "York stone" so with "Bath." The ancient precedents do indeed distinguish between "Corsham Down" and "Box Ground," but although most practising architects have received a box of samples from the Bath Stone Firms, Ltd., their specifications in too many cases still run on in the old way, and repeat the timeworn and out-of-date formula as if they were unaware of the existence of, let us say, such a stone as Monk's Park, or, if aware, were careless as to whether in some instances this or some other description might not for some particular purpose be more suitable than the two typical examples of Bath stone recognised in the mid-Victorian age.

Why is it that so many architects neglect—we will not say decline, for that would probably entail too much trouble—to avail themselves of the opportunities afforded by our merchants and manufacturers are ready enough to provide for discrimination between, not necessarily good and bad, but between suitable and unsuitable varieties of material for the particular building in hand? Can it be the fear of displaying ignorance that prevents them from utilising the wisdom of experts, even though the experts may be sellers of the goods of which they have no knowledge? The man who knows most is the one most ready to admit that he does not know everything. The man who is most eager to conceal his ignorance is the man who has most to conceal. Trouble it certainly is not to obtain information. A postcard or telephone call to any of our advertisers would at once bring the assistance required to prepare a satisfactory specification, adequate in describing without any uncertainty the kind and quality of materials which the employer's interest demands from the contractor, and enabling the latter to estimate with precision in making his tender.

Timber and stone do not exhaust the class of materials vaguely and insufficiently described by the verbiage of antique precedents. Compare for example the criterion of the quality of Portland cement based on the traditional specification clause with that of the British standard specification for Portland cement. Is it any wonder that the acute foreigner finds it easy to foist his rubbish on our market and worth his while to falsify descriptions and labels? Remember that the British standard is a standard, not an ideal or the gold water-mark of British cement manufacture, but the measure of the ordinary work of any decent, respectable factory. The stuff that would just satisfy the requirements of the traditional clauses in specifications is to-day scarcely to be found amongst the products of good English manufacturers of Portland cement, and these traditional clauses are now hopelessly obsolete.

however suitable they may have been to times past, when it was a legitimate question whether Roman or Portland cement should be used for any particular work.

We might continue to multiply instances in connection with other trades—iron, steel, lead, glass—to show how very far behind the times are many specifications put out at the present day by architects, to the disadvantage of their clients, the discouragement of manufacturers and merchants who are striving to improve their products and to develop hitherto neglected stores of material. The reputation of the architects suffers in the eyes of those with whom they have to deal, the honest and competent builder is handicapped and the scrupulous sharper is favoured.

We would urge the laggards in building methods to wake up, to take advantage of the Building Trades Exhibition which opens to-morrow, to get in touch with up-to-date merchants and manufacturers and learn from them, as can be easily and pleasantly done, how to diminish faulty specifications from their offices for ever.

THE DURABLE AND THE TRANSIENT.

ALTHOUGH usually placed first in editions of the plays, it is believed by scholars that SHAKESPEARE'S "Tempest," if not the last written of his works, belonged at least to the latest period of his activity as a dramatist and represents his benignest wisdom. The most familiar lines in it are those about the solemn temples, the gorgeous palaces, the cloud-capp'd towers dissolving like the insubstantial pageant which was introduced for the entertainment of two of the characters. Simple as the passage may appear, MACREADY, who was one of the most earnest of the students of the plays, was unable to decide how it should be delivered, and so to make a compromise with his artistic conscience. One evening it was declaimed in a solemn and sorrowful tone, and on another it was spoken trippingly on the tongue as if only minor importance were to be attached to the lines. It is easy to understand the reason of the grim tragedian's hesitation. If the words were taken as they would be interpreted by a Buddhist, there was little use in any work of man's, for even the most enduring of them all were doomed sooner or later to dissolution. SHAKESPEARE did not often refer to the practice of building, and he may have thought, like HORACE in an earlier age, that his own compositions were destined to outlast the noblest structures of stone.

What makes the words appear more remarkable is the time of their delivery. The reign of ELIZABETH and the early part of the reign of JAMES I. formed a most remarkable building age in England. New mansion houses for her reception were supposed to be most passing to ELIZABETH. It is supposed that through statecraft she inspired many of the nobles to expend their fortunes on great houses, and in that way prevented the application of the money to purposes of which she could not approve. We have only to contrast the visions of building with which BACON was inspired with the pessimistic conclusions of SHAKESPEARE in order to realise how differently men could consider the same subject about the same time. It would be interesting if we could have a disquisition by Sir HENRY WOTTON on the words of the two writers. There is no doubt that although the ex-ambassador and the Provost of Eton was a sermoniser he would have sided with BACON rather than with the dramatist.

There is, of course, undeniable truth in SHAKESPEARE'S words, and a similar thought must have struck serious men in all ages. It is like the old "Vanitas vanitatum." We possess, however, a varied history of architecture, because from earliest time men acted in defiance of such a theory of the inevitable ruin of all things. Even the Buddhists, although they were confident that everything was fleeting, erected stambhas, stupas, topes, "rails," chaityas, viharas which have

endured owing to their massive construction. Christian preachers were also obliged to accept and explain the nothingness of earth and of whatever man could do while a resident on it. Yet we know that from the beginning of our era efforts were made to erect churches which would be magnificent and enduring. The inconsistency between theory and practice was endeavoured to be explained by WORDSWORTH when he said "they dreamt not of a perishable home who thus could build," and described ecclesiastical buildings "as everlasting piles, types of the Spiritual Church." The poet was more true to himself in saying that if he had to abandon the world he would not seek refuge in one of the cloisters, but in some dry nook scooped out of living rock. Eastern hermits and other ascetics not only came to a like conclusion, but acted on it.

It is to be feared that in modern times there are indications that men are willing to depart from ancient customs concerning building. They realise the dissolving powers of destiny and are not disposed, like their predecessors, to contest them. In England especially it is found that a great house entails so much expense an owner can only use it on rare occasions. At the time when SHAKESPEARE wrote English gentlemen felt it was necessary to express their worth and state by the possession of becoming residences. WOTTON'S memorable words, "Every man's proper Mansion House and Home, being the Theater of his Hospitality, the Seate of Selfe-fruition, the comfortablest part of his owne Life, the Noblest of his Sonnes Inheritance, a kinde of private Princedome; nay, to the Possessors thereof, an Epitomie of the whole World," expressed what was accepted in the sixteenth and seventeenth centuries as an almost national duty. In our time it is not possible to act upon that principle more than partially. A country gentleman of any standing has interests in London which require careful personal attention. He may also consider it necessary to spend a part of every year in travelling, and the fraction of the year which can be devoted to rural life is limited. It is no longer necessary to have a house in London—a flat is accepted as an equivalent. Hospitality may be displayed elsewhere without any of the ancient ceremony. Not only dinners can be given in hotels, but the practice is becoming more general of having celebrations of weddings and the like in similar places. The middle classes have also become imitators, and the number of people who now make it a rule to let their houses for longer or shorter terms is incredible to all but house agents.

That the public mind is perverted on the subject of building is shown by the circumstance that London does not possess a municipal building which in any way corresponds with its magnitude, wealth or power. There was no outside approval except among architects when it was proposed to erect such a building, and there would be no protest if, as is not unlikely, the newly constituted County Council were to announce that the competition was postponed or set aside. To anyone who considers how close is the connection between business and a suitable building for the transaction of it, the disregard of the conditions under which the Council's officials have to work is a matter for serious reflection.

There is another circumstance which is also worth attention. When it was proposed to erect very cheap cottages the original intention was to accommodate workmen and others of a humble class. The idea was at once adopted for the benefit of occupiers of another sort. Cottages or bungalows of limited accommodation, and which could be put together for a sum comparatively small, were at once offered to those who claimed to be superior to workmen, but who wished to escape from the monotony of life in one place when it could be obtained without much cost. Residences of the kind will be seen in the Building Exhibition which is about to be opened, and many other examples can be discovered without difficulty in different parts of the

country. It would seem as if the "simple life" structures were destined to be supplementary to flats, and that a somewhat novel system of housing was about to be more generally adopted than could have been anticipated some years ago. In connection with this revolution—for it is nothing else—we must also notice the objections which are raised to modern dwellings in large blocks and the endeavour to supersede them by cottages. Public schools, which a few years ago were so elevated as to become landmarks in some districts of the Metropolis, are in the future to be represented by buildings of one or two storeys in height. Everywhere, in fact, are signs of a departure from conditions which at one time were supposed to be inevitable and unchangeable.

It is also remarkable that the demand has created a supply for construction which differs from what was consecrated by time. Instead of taking stones from a quarry and shaping them into desired forms by hand, artificial stones, either in solid blocks or moulded or ornamented, can now be supplied without delay. The interior of a building as well as the exterior can also present novelties. Partitions are now obtainable which enable rooms to be arranged almost as soon as the outer walls are completed. Staircases can be more quickly set up than scaffolding, and it is known that in American cities offices are occupied before the whole of the exterior is completed. If the buildings are to dissolve as if they were exhalations, according to SHAKESPEARE, it can soon be said of them that they arose as quickly as those imagined by the poet. If desired, it is also feasible to have magnificence on a short notice, for the division of labour is so perfect and manufacturers are so willing to meet all demands if money is forthcoming that we may expect to see some day—

A wilderness of building, sinking far
And self-withdrawn into a wondrous depth,
Far sinking into splendour without end!
Fabric it seemed of diamond and of gold,
With alabaster domes and silver spires,
And blazing terrace upon terrace, high
Uplifted; here, serene pavilions bright,
In avenues disposed; there, towers begirt
With battlements that on their restless fronts
Bore stars—

produced with the expedition of a pageant on the stage.

It is doubtful, however, whether real magnificence will be sought, although it could be furnished. The stern necessities of building are shortly to have the upper hand, and all features which might be considered as essential to show are likely to be sacrificed. We can see a suggestion of what is coming in the paper which was read by Mr. E. T. HALL at the last meeting of the Architectural Association. The high-class permanent sanatoria already existing, he said, ranged in cost from 350*l.* to 600*l.* per bed, and even to over 1,000*l.* But, according to Dr. HERON, "a sanatorium well equipped for the service of the poor should not cost more than 80*l.* per bed." If one class of patient can be accommodated so cheaply, why not others? Consumption, like death, levels distinctions, and to a utilitarian philosopher it must seem to be a mockery to expend 800*l.* or 1,000*l.* per bed in a hospital if the money cannot purchase curative needs. But to erect sanatoria at so cheap a rate Mr. HALL proposed to utilise materials of a different kind to those in similar buildings, and which might not receive the sanction of a local board if one existed in the district.

If an economical system can be adopted for a sanatorium, people will ask why similar materials should not be employed in buildings of different classes where economy must be respected. The answer is that by-laws must be obeyed to the letter, and we all know to our cost that one great obstacle to the erection of new buildings at the present day arises from the system which is enforced by local authorities. They have little choice, it must be allowed, for they have to carry out the rules and regulations which come from

Whitehall, and which were prepared solely to prevent evils which are the result of dishonesty. Unfortunately there is a class of men who if they are not fined and threatened with grave punishment will use materials which are dangerous to the occupiers of houses and to other people also. A too lax interpretation of by-laws would create buildings of a kind which it would be an advantage to have dissolved quickly as if they were only the visions of a nightmare. By-laws tend to solidity and to sanitation, but the public seem disposed to sacrifice solidity, at least, for quick production and economy. The problem is therefore one which it is difficult to solve. Architects no doubt suffer by the interference of men in office who are without any skill in architecture, and the annoyance is increased because it seems to be due to the belief that architects also are disposed to sacrifice some of the essentials of good building for the sake of profit.

It is always difficult to discover the true origin of prejudices. It is not unlikely that the change in the opinion of Englishmen, which causes them to forget canons of construction which have come down to us from ancient times, has arisen in some measure from the marvellous success of the Japanese. Many travellers who visited the islands fell into the stereotyped way of describing the ancient buildings of the country. The people are proud of their past, and as ancient robes and ancient examples of pottery are carefully preserved in families, some remains of ancient temples are honoured and upheld for the general good. But everyone knows that the peculiarity of Japan is that in its buildings, like works of art, are as flimsy as SAKYA MUNI could have desired. The drawings on paper or silk and the screens of those materials are in keeping with the character of the habitations. LAFCADIO HEARN, who was the lecturer on English literature in the Imperial University of Japan, and who became as much a citizen as was possible for a stranger who was a Japanese in his heart, has revealed to us that what seems best in Japan is really no more than such an insubstantial pageant of towers and palaces and temples as PROSPERO might have evoked to charm FERDINAND and MIRANDA. He speaks in one place of a district that seems to be enchanted; the pale yellow walls are coped with blue and pierced with elfish gates, and each vista gave him, he says, the same thrill of pleasure as would a perfect expression of a thought in a poem. And yet when analysed he has to own in what it consisted:—

The wonderful walls were but painted mud, the gate and the temples only frames of wood supporting tiles; the shrubbery, the stonework, the lotus ponds, mere landscap gardening. Nothing solid, nothing enduring; but a combination so beautiful of lines and colours and shadows that no speech could paint it. Nay; even were those earthen walls turned into lemon-coloured marble and their tiling into amethyst; even were the material of the temple transformed into substance precious as that of the palace described in the Sutra of the Great King of Glory—still the æsthetic suggestion, the dreamy repose, the mellow loveliness and softness of the scene could not be in the least enhanced. Perhaps it is just because the material of such creation is so frail that its art is so marvellous. The most wonderful architecture, the most enhancing landscapes are formed with substance the most imponderable—the substance of clouds.

LAFCADIO HEARN believed that whatever makes life beautiful in any land is derived from illusions. It is possible in Japan, when under the glamour of novel conditions, to create beautiful things out of the substance of clouds, but we doubt if a Japanese artist or poet could create a vision of beauty from the substance of a London fog. We live, perhaps, under unfavourable conditions, but they must be obeyed. The Japanese, although they reside in ramshackle structures, have accomplished as great deeds as if they lived in Roman palaces. But it was not the simplicity of their habitations which created a nation of heroes. Their houses are, no doubt, suggestive of Buddhist beliefs, for the

doctrine of the unreality of all things seem to be embodied in the temples as well as in the houses. Street improvements can also be accomplished in a Japanese city at a rate which would appear startling in England. But if we were to set about pulling-down substantial buildings and substituting for them shanties corresponding with those of the Japanese, it would not follow that our moral character would be elevated by the transformation. Those who point to Japan as an example of what can be done cheaply and expeditiously to provide accommodation for all classes should remember that the Eastern people are obeying their traditions just as we are in our way. They can supply our imagination what we have to do in solid materials, and their experience is of little use to us, especially in all that relates to the permanent in building.

NEW BOOKS.

THE additions to the literature of construction in different forms continue to increase. This is a peculiarity which characterises the present time. Formerly men trusted to their training as apprentices and their subsequent experience. Price books alone received attention. Nowadays apprenticeship is of a different character. It is not considered necessary for workman to impart information, and young people who wish to be masters of a subject have to rely in a large measure for instruction on books and technical classes. It remains to be seen whether the new race of artificers are superior to their predecessors, but if they are inferior it will not be the fault of publishers. Technical manuals abound, and they are generally well adapted for use. The "Modern Plumber and Sanitary Engineer," which is edited by Mr. G. LISTER SUTCLIFFE (the Gresham Publishing Company), promises to be adapted for a type of the best class of technical treatises. Plumbing or sanitary work a few years ago was supposed to be an incidental part of the very varied business of any ironworker who opened a shop in town or country. Nobody required about his ability in drainage. The men who were employed were without adequate control, and it was inevitable that carelessness and dangerous blunders should arise. Although the Plumbers' Company unintentionally may have created a monopoly, and their examinations are not sufficient, there can be no doubt the Company's organisation has produced a general desire for work which will be protective against evils under manifold forms. Sixteen specialists will contribute to the new treatise. If, as we may be confident, all will resemble the first division, it will not be difficult for a workman of ordinary intelligence to understand not only the theory but the practice of plumbing. It may be too much to expect that a novice, after reading the descriptions and studying the illustrations, would be able to accomplish a wiped joint which should be efficient and not unpleasant to look at, but he might at least understand what he is aiming at and the process which will lead to success. The first section, which deals with materials, is by the editor. The second, on the "Elements of Practical Plumbing," is by Mr. JAMES GAMMIE, who is known as a teacher in various metropolitan schools and as a craftsman. The third is by Mr. J. W. HART, and includes a chapter on "Ornamental Leadwork," or rather as much as is likely to be required at the present time. Almost every page is a diagram or illustration of a kind which it is easy to comprehend. The work when completed would be well adapted for prizes for successful students in the examinations of the Plumbers' Company, the City and Guilds Institute, &c.

A volume which is arranged on a different plan but is equally well adapted for the use of special students in "Carpentry and Joinery," edited by Mr. PAUL N. CASLUCK (CASSELL & Co.). It also embodies the work of several contributors. There are 567 pages, but the

illustrations number 1,800. The latter are all carefully drawn, and besides plans and sections of details conventional or isometrical views are given. In fact, the illustrations by themselves would be almost sufficient to suggest the work which the carpenter or joiner will have to perform. The views of buildings or parts of them may not be suggestive of high-class architecture, but it is not the purpose of the volume to teach design. History is neglected, and the work in fact is devoted to English practice of the present time in all its varieties. The price of the book is only 7s. 6d., and it would be difficult to discover a cheaper or more useful volume on a technical subject.

"The Principles of Architectural Design," by Mr. PERCY L. C. MARKS (SWAN SONNENSCHN & Co., LTD.), is based on articles which appeared in *The Architect*. There is no more difficult subject, and it requires no small amount of courage to undertake it, especially if the author introduces designs of his own. Mr. MARKS shows great tact throughout the pages, and nobody can charge him with presumption. The articles in this Journal were confined to exterior design; in the volume they are supplemented by others relating to interiors. A great many architects have allowed sketches to be made from their works, and the selection in all cases reveals that Mr. MARKS is a careful observer. His collection of scraps or fragments is of exceeding interest. In the text the author does not pose as an infallible authority. We have, rather, a student speaking to other students in a friendly and sincere manner. A great many subjects are touched upon and the remarks are always pertinent and honest. The volume forms an indispensable companion to the author's "Principles of Planning."

The sixth and concluding volume of "Modern Buildings, their Planning, Construction and Equipment," edited by C. A. T. MIDDLETON, A.R.I.B.A. (the Caxton Publishing Company), has appeared. The subjects are miscellaneous buildings and their fittings, builder's plant and scaffolding, and South African planning and construction. But those headings do not convey a sufficient notion of the variety which is in the volume, as well as in each of those that came before it. In hotels, for instance, plans are given of the new Piccadilly hotel, in which a difficult and costly site is utilised with great skill and respect for economy. It seems a descent from such a building to treat of dairies, stables, bakeries, laundries and the like, but architecture must now deal with works which used to be supposed as far outside its province. The descriptions of the plants required for large and small building works will often be found useful, for if there are not sufficient appliances on the site work is likely to be delayed. The chapter on the requirements in South African work, by Mr. H. S. EAST, is one of the useful series relating to the requirements of the Colonies. Under present circumstances some bravery is required in an Englishman who would attempt to seek a practice in South Africa. But judging by the illustrations, fine buildings have been lately completed. The Duke of WESTMINSTER has had erected a house at Thabanchu (Orange River Colony) which in style resembles an old Dutch farmhouse. The walls are of a beautiful freestone of a warm, cream colour and the roof is of imported Bridgwater tiles. Sir J. L. HULETT's mansion is more grandiose, for it suggests Georgian or Italian mansions which at one time were prized in England. Mr. EAST believes that experience in South Africa is necessary for any architects who aspire to success. He says he has had several opportunities of studying plans, working drawings and details of houses designed by British architects for South Africa. "In the best, although the defects and differences may seem but small to the outside eye, they (the defects) are often of such a character as to nullify many excellent points in the plans and design. In the worst, the houses are but travesties of what a South African house should be."

The descriptions of buildings are supplemented by a South African specification. The elaborate index suggests the vast number of topics which are treated in the six volumes. The work is of unique character, and much will be found in the pages beyond what generally forms part of treatises on building. The number of writers who have co-operated in the production gives a freshness to the treatment, and the volumes in consequence are unusually interesting. The illustrations are numerous and elaborate, and all who are concerned in the production have loyally seconded the editor in his desire to present a work which can be referred to with confidence.

The Slate and Tile Tables compiled by Mr. O. LLOYD OWEN (Criterion Press) are intended to show at a glance "methods of ascertaining the cost of roofing materials, their covering capacities at various laps and the conversion of any given price to its requisite equivalent." Unlike most volumes which consist of tables, the figures are of a size that is easily legible, and are not closely packed in a way which fatigues the eyes. These can be consulted without the least difficulty, and can be used for many hours at a stretch. We have met with no better collection, and it is unnecessary to say that time will be saved by consulting them and accuracy insured.

SCHOOLS AT CRESSING, NEAR BRAINTREE.

THIS village school was designed by Messrs. CLARE & ROSS, M.S.A., of 1 West Street, Finsbury Circus, E.C. The interior is furnished throughout with a brown glazed-brick dado, capping and skirting, and the walls above are faced with carefully selected Fletton bricks, flush-pointed and dis-tempered.

Accommodation is provided for 120 children, and the

school, which is divided by screens into three sections can be thrown open to hold a meeting of 300 persons. The playground occupies a quarter of an acre, and is surrounded by an unclimbable iron fence. On the east side of the school is a six-roomed house for the head mistress. Mr. FRANK JOHNSON, of Chelmsford, was the builder. Ventilation is by windows and "Offa" patent inlets, with openings in the ceiling and concealed roof ventilators for extraction. The rooms are warmed by LANDERS'S patent grates, which supply warm fresh air to the classrooms, and, by means of supplementary flue on the back, are made to ventilate the cloak-rooms as well.

Swivel shutter partitions were supplied by the North of England School Furnishing Company. The walls outside are faced with local red bricks, and the roofs covered with Tilberthwaite Westmoreland green slates in diminishing courses. The windows are solid frames filled in with lead glazing, and metal casement to opening lights. The ceilings are plastered and barrel-shaped throughout.

Beverley Minster has been insured for 66,100*l*. According to Canon Nolloth thirty statues were being added to the west front, and it was intended to restore some of the rich carved work of the niches. Notwithstanding what had been said by ultra antiquaries, they would not be deterred, but intended to restore in such a manner as would compare favourably with the old work.

The Proposed technical college for Aberdeen will have five departments corresponding with the leading industries of the district:—(1) Engineering; (2) Architecture; (3) Chemistry; (4) Artistic Crafts; and (5) Fisheries and Navigation. The cost of building and equipment has been estimated, apart from sites, at about 100,000*l*., and the annual expenditure at 15,000*l*.

PLAN

NOTES AND COMMENTS.

As long as buildings have to be erected according to designs, we suppose there will be disagreement about the amount of architects' fees. The percentage commission is often said to be the cause of extra expenditure, and payment in a sum to be agreed upon is sometimes proposed as a substitute. According to the *Inland Architect* of Chicago, a variation on the lump sum plan has been found to work very satisfactorily in American practice, both by the owner and the architect. This provides for the establishment at the start of a fixed price as the cost of the proposed building. The minimum price to be paid the architect is also fixed in advance. This may be a lump sum determined on a basis a little under the Institute schedule, say of 4 per cent. A further agreement between the owner and the architect provides that the latter is to receive, as additional compensation, a commission of 10 per cent. upon what he saves the owner on the cost price as fixed in advance. One architect's returns under such an arrangement equal $7\frac{1}{2}$ per cent. of the final cost of the buildings, and the owner is satisfied that he builds at a price appreciably less than would be possible under the usual plan. Probably this arrangement would not be equally satisfactory for all classes of buildings. It has been found to work well with such buildings as factories and warehouses, classes where it is not difficult to fix in advance a fair cost price, nor to readily detect as the work progresses inferior workmanship and materials. An important consideration in such a plan, of course, is that the owner must have absolute confidence in the integrity of his architect.

AUSTRALIA is found to be richer in marbles than was supposed. An exhibition was lately held, under the auspices of the Royal Victorian Institute of Architects, which was successful. Marble from Croajingalong quarried in any desired dimensions could be put upon the market at 2*l.* per ton. But as yet the financial questions are not worked out definitely. It is evident that the organisation of the workmen will have to be changed if the marble is to attain commercial success. At present it appears the quarriers consider 5*l.* a week is sufficient earning, and as soon as they reach that sum work is suspended. Orders cannot therefore be fulfilled with punctuality. The following resolution was adopted:—"That in the opinion of the Institute the marbles exhibited are of excellent quality, and that it would be to the advantage of members if they could be placed on the market for use in buildings." The success of the Croajingalong experiment has inspired others.

HEXHAM, which stands on the river Tyne, was the centre of one of the early dioceses of England. In A.D. 706 WILFRID, who was head of the monastery of Ripon, was appointed to the see. He was a traveller and had visited Rome more than once. When the works at the abbey church of Hexham were recently undertaken, it was anticipated that many relics of WILFRID's church would be revealed. Some Roman stones were found, which had been preserved in the crypt. But according to the rector, the Rev. E. SIDNEY SAVAGE, the only complete piece of detail which belonged to WILFRID's church or cathedral is a large slab about 2 feet square and 6 inches thick, moulded on two of its edges with a section similar to those on stones at Barnack and Peterborough. At the end of a step in the well stair is a piece of carving in the form of a volute. There are also parts of the carved string-courses of the church, with which it seems to have been liberally furnished both inside and outside. Other remains are a good stretch of the foundation and lower courses of the north wall, parts of the foundation of the west and south walls, and a great mass of foundation of apparently a great pier near the centre of the church and in close proximity to the crypt. The bottom of this was only reached at a depth of 19 feet from the

surface, and the mass is about 12 feet by 9 feet in length and breadth. The abbey church dates from the twelfth century.

A FEW years ago we had the privilege of reproducing the principal water-colour drawings by COTMAN, of Norwich, from the collection of Mr. JAMES REEVE, which afterwards was purchased by the Trustees of the British Museum. An article by Mr. A. P. NICHOLSON in the last number of the *Nineteenth Century* gives some account of COTMAN and other representatives of the Norwich school. COTMAN used in 1834 to visit ARTHUR STARK, who lived in Chelsea. It was intended that COTMAN should design some pictures which STARK was to execute. The project was not realised. According to Mr. NICHOLSON, at that time COTMAN must have been a picturesque figure, for "he used often to walk the streets of London in a riding coat, gaitered and spurred, carrying a riding-whip and accompanied by two great bloodhounds in a leash. Doubtless it was the habit of his Norfolk days, which he had not yet discarded." COTMAN is badly represented in public galleries. The *Dutch Galliot* in the National Gallery is a notorious forgery, and should be turned out.

ILLUSTRATIONS.

VICTORIA AND ALBERT MUSEUM, SOUTH KENSINGTON.

SEVERAL years have elapsed since the competition was decided for completing the South Kensington Museum. The treasures attracted so many visitors, although the exterior continued to recall the "Brompton boilers," it may have been supposed by the Treasury that the erection of other buildings such as the Science Schools was more urgent; besides, more opportunities were given to the students of the College of Art to observe building works. It will be seen that Sir ASTON WEBB has not accepted the FOWKE or SCOTT traditions, and has treated the front with great freedom. The statues of artists appear as part of the masonry and could not be detached without loss. They are truly decorative elements. The last report of the Board of Education states that the four following students, MESSRS. GOULDEN, VINCENT HILL, STEVENSON and BOYES were asked by Sir ASTON WEBB, R.A., to execute, under the direction of the Professor, statues of LORD LEIGHTON, Sir JOHN MILLAIS, G. F. WATTS and CONSTABLE, for the façade of the new Victoria and Albert Museum. They made the models in clay and then carved the statues *in situ*, the whole work being carried out to the entire satisfaction of the architect. This appropriate opportunity of applying the studies of the school to the decoration of an important building has not only contributed much to the progress of those actually engaged on the work, but has also been of advantage to the other students of the school, who have followed the work from the first sketch to the finish.

COMPETITION DESIGN FOR CHALKWELL HALL SCHOOLS, WESTCLIFF-ON-SEA.

THE site for the Chalkwell Hall schools is irregular in shape, but an effort was made to have uniform areas for the playgrounds and to allow the admission of sunlight to every classroom. The latter are lighted from the left with the exception of the double classroom. In some cases windows are provided on other sides to give natural cross ventilation in addition to artificial. All windows are carried up to within 6 inches of ceiling line. For ventilation BOYLE's fresh-air inlets are provided. Heating is effected by ventilating radiators. The teachers' rooms secure perfect supervision of playgrounds, halls, &c. The floors of classrooms and halls are to be laid with wood blocks. The total cost of buildings, including architect's fees, was estimated at 14,400*l.*

HEAD-QUARTERS FOR THE ESSEX COUNTY POLICE,

PREHISTORIC MAN IN SHROPSHIRE.*

IT is difficult within the compass of a short paper to give a clear idea of the story of a period whose limits we are unable to define with exactness, but which covered many centuries. The task, however, is rendered more easy in the case of Shropshire than in the case of more southern counties by the fact that the story does not begin so early. The first inhabitants of Britain were the men of whom the races are to be found in the river drifts of the Thames valley and elsewhere in the south, and these were followed by the cave dwellers. Both these are classed under the term Palæolithic, and date back to a time when England was joined to the Continent and the conditions of climate were very different from what they are now. It has been generally accepted dictum that no Palæolithic remains are to be found north of a line drawn through Derbyshire, and though in recent years some doubt has been thrown on this by discoveries in the drift of the valley of the Trent, no races have up to the present been found in Shropshire. We may, therefore, at any rate until further discoveries, dismiss the idea that the Palæolithic hunter roamed its forests in pursuit of mammoth or elk; in that era it was probably either submerged or had a climate too rigorous for human habitation. In time, however, Palæolithic man passed from the scene, and after an interval which we cannot count in years another race appeared in Britain to whom we give the name of Neolithic. What was their connection with the Palæoliths we cannot tell, or whether they were connected at all. They had some points in common with them, but rude as Neolithic civilisation still was it showed an advance on that of the previous race. It is with the coming of these Neoliths that the story of Shropshire begins, and it will be best understood by a reference to geography. By this time the British Isles had practically taken their present form, and were separated from the Continent by the channel which still divides them. The climate, too, had become comparatively temperate and the conditions of life were much what they are now. The internal aspect of the country as regards its physical features was but little different; mountains stood where they stand at present and rivers flowed in the same courses. This must be borne in mind whenever we attempt to deal with the history of Shropshire. In prehistoric times no less than those which came later its geographical character is largely the key to its story. It must be borne in mind, then, that what is now the county of Salop consists of two portions, divided by the river Severn, of which the northern half is for the most part flat and the southern almost entirely made up of hills. The Severn forms a natural highway connecting the county with the south, while in the west, in what is now Wales, its hills pass into rugged mountains and fastnesses. On the one hand, remote from the Continent, it was slow to feel European influence, but, on the other hand, it could not ultimately escape that influence because the only escape from it was into the mountains or the sea. So it is that Shropshire has been the battle-ground of advancing civilisation from the most ancient down to the most modern times.

In the prehistoric period, by which we mean roughly the period ranging from the earliest times to the coming of the Romans, we have to deal with the invasion and settlement of three different peoples. The first of these is that which is known by the name of Iberians, who possibly are represented in modern times by the inhabitants of the Basque provinces on each side of the Pyrenees. Their hold in England was extensive. Their characteristic features are to be traced not only in Wales—especially in the south and the border counties, but in Yorkshire and several other parts of England. They were not, however, allowed to maintain possession undisturbed, but were driven westward by an invasion of Celts, an Aryan race, whose original home seems to have been Central Asia. These were known as Goidels, and they were in turn themselves driven westward by another Celtic people known as Brythons. Each of these invasions indicated an advancing wave of civilisation which was marked by some special characteristics, though which was common to all. It is the aim of this paper to fill out the outline thus presented by the light of actual discoveries in the county.

On the principle, then, which is laid down in the first number of the *Spectator*, that every reader wishes to begin with knowing the personal appearance and condition of the characters introduced, there come the questions:—What

were the physical characteristics of our prehistoric ancestors? Whom did they resemble of the human types with which we are now familiar? These questions are answered by the human remains disinterred from sepulchral mounds of the period, and the correctness is no longer doubted. The non-Aryan Iberian race were short of stature, the men not exceeding 5 feet 6 inches and thick-set in figure, their special characteristic being the length of their skull, such as may be seen in a specimen found near Wroxeter and preserved in the Shrewsbury Museum. The outline of the face was oval, and the jaws did not project, but the forehead was comparatively low and the nose was aquiline.* The type, as already mentioned, is still to be found in several parts of the country, especially in South Wales. It is not uncommon in Shropshire, and the modern representatives enable us to complete the picture of their Neolithic ancestors. They had black hair and black eyes, and except for the shortness of their stature were a handsome race, possessed of considerable mental capacity.

The Celts who followed were of widely different appearance from the Iberians. In contrast with the dolichocephalic, or long skulls of the earlier race, their own were brachycephalic, or round; their faces were angular, their jaws were prominent and their cheek bones stood out under a high broad forehead. Their height averaged 5 feet 8 inches, and we know from their modern representatives, which are everywhere in Wales and the borderland, that they had fair complexions with red hair and blue eyes.

We turn now from the people themselves to their surroundings and pursuits. First as to their home. To a certain extent all through the prehistoric period, and especially in the earlier Neolithic period, the inhabitants both of Britain and the Continent lived either in pit dwellings or lake huts, exchanging them as time went on for stone huts above ground. In order to understand these customs we must bear in mind that in prehistoric times Shropshire was a vast forest, except on the tops and higher slopes of the hills, and what there was of valley not covered by trees was largely given over to water in the form of river, or lake, or marsh. The range of spots on which human habitation was possible was limited, and was still further affected by the humidity of the climate. We have no statistics of prehistoric fever and ague, but even Neolithic man must have found out that life was longer under some conditions than others. It is, therefore, in accordance with expectation that we find a Neolithic settlement of pit dwellings on the summit of the highest hill in Shropshire. Abdon Burf, on the top of the Brown Clee, consists of an enclosure surrounded by a stone rampart, and within it are numerous depressions whose appearance points clearly to their being pit dwellings; but they have never been scientifically investigated, and until careful excavations have been made it may be wise to a certain extent to suspend judgment. At present the only direct evidence seems to be the discovery a few years ago at the foot of the hill of a polished hatchet of local stone, which is now in the possession of Lord Boyne. Another Neolithic settlement, similarly situated on the summit of Rock Hill, near Clun, was investigated by the late Mr. George Luff, who found a considerable number of stone implements, which are now in the Shrewsbury Museum. The same sort of evidence, though on what may be called a smaller scale, points to the existence of a similar settlement on a piece of high ground in my own parish. It is the only spot in the neighbourhood with a Celtic name, "Pentre," and the only spot, as far as I know, near which flints have been found. Within sight of it also were dug up two early cinerary urns which I shall allude to later on.

Shropshire, however, in Neolithic times had within its borders a considerable area covered by water. The neighbourhood of Ellesmere is still a lake country, and meres must have been much more extensive in early days. Mr. Luff was of opinion that there was in prehistoric times a large lake at the foot of the hill on which he found the implements referred to; and in my own parish Bomere Pool is the largest survival of a series, which can easily be traced all through the neighbourhood. It is highly probable that hut dwellings existed on the borders of some of the Ellesmere meres, and a few years ago it was thought that traces of such a settlement had been discovered. Investigations left the case not proven. That the country, however, was occupied by a considerable population is shown by the fact that no less than three canoes made of tree trunks have been discovered at different times in the

* A paper by Rev. Prebendary Auden, read at a meeting of the Cadoc and Severn Valley Field Club, published in the *Shrewsbury Chronicle*.

* Boyd Dawkins, *Early Man in Britain*, pp. 311-6.

peat, one of which is to be seen in Ellesmere town hall. Sometimes the home of the prehistoric inhabitant found its protection in a somewhat different form. In the neighbourhood of Baschurch is a spot called The Berth, which approaches in some respects what in Scotland and Ireland is known as a crannog. It consists of two elevated portions of ground which originally stood out from a morass which entirely surrounded them. These islands, as they were then, formed the settlement, and no doubt were crowned with huts. The morass is now dried up and the huts have vanished, but there remains an equally interesting trace of their occupation. The two mounds are still connected by an artificially formed causeway, some 150 yards in length and 4 yards wide, while another causeway gave access to what we may call the mainland. A somewhat similar prehistoric settlement in my own parish is much less generally known. Those acquainted with Bomere will remember that, between the pool itself and the marsh known as Showmere, the land forms a ridge along which runs the cart track from Bomere Farm to the keeper's cottage. Probably few, however, will have noticed that at each end of this ridge, not far from the houses just mentioned, it has been artificially cut through, so that the water of the present deep lake, like that of the more shallow one which occupied the marsh, would be connected, or be crossed only by a narrow causeway. The island thus formed would be an ideal place of safety in early times, and though at present, as far as I know, nothing in the way of prehistoric remains has been found at Bomere, it is, to say the least, not unreasonable to claim it as a relic of Neolithic times. On the top of Corndon are heaps of stone which appear to be remains of huts which were above ground as distinguished from pit dwellings. In this connection it may be well to mention the camps of refuge which those who lived on or near the hills seem invariably to have had. These appear not to have been primarily constructed for permanent habitation, but were places to which they could betake themselves, with their cattle and other belongings, in times of danger. It is impossible to name all that exist in Shropshire, or to say to what exact period each one belongs. It is hardly too much to say that every hill has its earthwork or "camp" of some kind, and many of these go back to Neolithic times, though they were probably utilised afterwards by other races down to historic times. Indeed it is almost certain that parts of the dyke which we attribute to the Saxon king Offa date back to a far earlier period, and that his work was in many places not to construct but only to make connecting links between defences ready to his hand.

We now turn to the tools and implements used by our prehistoric ancestors. The Iberians had only those made of stone, while the Goidels brought with them implements of bronze and the Brythons were acquainted with the use of iron. It is not meant that these respective materials were used exclusively by each people mentioned. The use both of stone and bronze continued side by side with that of iron down to the close of the prehistoric period, but it is convenient to divide it into a Stone Age, a Bronze Age and an Iron Age.

What traces then have we of these three ages in Shropshire? Before, however, proceeding to speak of these in detail, I must remind you again of the physical characteristics of the county, namely, that the north is flat and the south is hilly: in other words, the north would always be easily accessible by an invader and easily conquered, while the south would afford fastnesses to those in possession from which they would be dislodged with difficulty. The result was that in the Celtic invasion, while the old race held its own among the hills of the south, the invading race with its more advanced civilisation took possession speedily of the northern plain and settled down there. This course of events, which is according to our expectations, has an interesting confirmation in the implements which have been discovered. The bronze implements have all, roughly speaking, been found north of the Severn, while those of stone have been found south of it, the bronze in the plain and the stone among the hills.

Among the relics of prehistoric life which have been found, the first place may be given to the implements—mostly of flint—found by Mr. Luff in the neighbourhood of Clun, and now deposited in the Shrewsbury Museum. They include arrow-heads, scrapers—probably used in skinning animals—and stone rings, which may have been spindle whorls used in weaving or weights for fishing lines. Mr. Luff hazarded the conjecture that they were an early form of money. Alongside of these in the museum are a

number of axes and hammers, some of which were found in Shropshire. These are mostly of polished stone other than flint, but the hammers belong to a somewhat later age, being large in size and perforated to receive a handle, instead of being themselves inserted in a handle, which was the primitive form.

Clun, however, is not the only part of the county which has yielded a comparatively rich harvest of stone implements. Mr. T. R. Horton has collected a considerable number from Harley and the neighbourhood, some of which he kindly allows me to exhibit to-night. It seems clear that the high ground of which Kenley may be taken as the centre was the seat of an important Neolithic settlement, which the camp on Acton Burnell Hill may be a further remnant. The traces of Roman roads and settlements in the neighbourhood go to confirm this. In their conquest of the original occupants of the region the Romans discovered its beauty, and opened it up for their own occupation. The contents of Mr. Horton's collection are for the most part parallel to those gathered by Mr. Luff, and clearly belong to the same stage of civilisation.

We pass to the age of Bronze. This, it will be remembered, is a mixture of copper and tin. There are a few instances in which implements have been found of pure copper, but those who discovered the use of copper very soon found that it was much more durable and useful if it was alloyed with tin, and so bronze implements became comparatively as numerous in the second prehistoric period as stone had previously been, though it must be borne in mind that stone continued still to be used. Bronze-cutting implements show a considerable variety of shape and skill in manufacture. At first they were clearly modelled on the shape of the stone implements—a flat piece of metal with a cutting edge—but by degrees a stop-ridge was elaborated to give firmness to the handle and then gradually wings were added, which developed into a socket. The specimens in the Shrewsbury Museum embrace examples of all these stages and so tend to show that the Bronze Age in Shropshire extended over a considerable period. Several specimens from the county are enumerated in Sir John Evans's "Bronze Implements," but there are also several to be seen in Mr. Beville Stanier's museum at Peplow. These were apparently all found in the neighbourhood of the Red Castle at Hawkstone, and the collection includes also an example of bronze spear heads, of which there are two in the Shrewsbury Museum. Spears and daggers, as well as arrows, formed the offensive weapons of the Bronze period, the defensive weapons being a small round buckler of which an example was found some years ago near Ellesmere.

It will be sufficient to make only a passing allusion to the connecting link which we yet have in Shropshire with prehistoric times, viz. the coracles still in use on the Severn. They are the direct descendants of the boats in which our remote ancestors fished in the same river. Fishing was one source of their food supply, another being, of course hunting, but even the earliest Neoliths did not depend wholly on the chase, as their predecessors, the Palæoliths had done. They cultivated the ground and used its products both for food and clothing. They were acquainted with various kinds of grain, and wore garments made from flax, as well as those made from the wool or the skin of beasts.

No doubt in all these things there was advance through the prehistoric period, and with regard to many is not possible to say when they were introduced, but the second Celtic invasion—that of the Brythons—was apparently marked, like that of their predecessors, the Goidels, by one very distinct change. This was the introduction of iron, which more perhaps than anything else has in every age since swayed the destinies of the world. It did not at once supersede either stone or bronze, but soon proved itself so useful and so capable of serving many purposes that they gradually fell into disuse, and there was developed an Iron Age that, in a sense, has lasted till our own time, and so by degrees prehistoric man passed in historic—the man of whose doings we conjecture into the man of whose doings we know.

It remains, however, that I should say a few words about our prehistoric ancestors in death as well as in life. It is from sepulchral mounds that the clearest intimations are derived of what were their customs while living. The dolichocephalic Iberian race buried their dead in long oval-shaped barrows, the body being placed in a sitting posture under stones which are often now to be seen above ground, and are known as cromlechs. The posture of the

body was probably derived from the manner in which they were accustomed to sleep in their huts. Long barrows which have been carefully explored have usually contained stone implements of various kinds, both alongside of the body and in the substance of the mound itself. The latter fact has led to the suggestion that at the time of the interment flints were scattered on the grave in honour of the dead as we scatter flowers, and that our own custom is, in fact, a survival of it. The Celtic race appear to have introduced some changes in their mode of burial: They still heaped barrows over their dead, but they were smaller and round in shape, and they introduced or adopted at an early period the custom of cremation; and from this time onward burning seems to have existed alongside of burial. The period of these interments is marked as before by the implements or ornaments found. The barrows of Shropshire almost without exception are round and belong to the Celtic race, but very few have been properly examined. In the case of those on the "Old Field," now used as the Ludlow racecourse, the interments had followed cremation, and the fragments of metal were of bronze. The practice of cremation brought into prominence another criterion of prehistoric civilisation. A certain amount of coarse pottery has been found in the long barrows of the early Neoliths, but when cremation became an established custom, urns for containing the ashes became a necessity, and such cinerary urns have been found in considerable numbers. Those of early date are easily distinguished from those of the Roman period by the poor quality of the pottery and the rudeness of the ornamentation. I am able to-night to show you the fragments of two such urns found in my own parish, to which I have already alluded. They were discovered about 2 feet below the surface of a field at Ryton, and about a yard from each other. The first stood upright, the second was inverted. They belong to the late Bronze or the early Iron Age. Very similar urns were found on the "Old Field" at Ludlow. It was, no doubt, in connection with burials that stone circles were originally formed, the upright stones at first marking the boundaries of a barrow. The only circle now remaining actually in Shropshire is Mitchell's Fold, near Minsterley, of which some of the upright stones stand about 6 feet out of the ground, but the remains of several others are to be found in the neighbourhood just outside of the county. It is curious that they should be confined so entirely to this corner, and difficult to account for. It may arise from the fact that these circles became associated with worship, even if they had not such a purpose from the first. Much obscurity naturally surrounds the subject, and possibly there was considerable difference between the religious cults of the non-Aryan Iberians and the Aryan Celts, but there can be little doubt that the sun entered largely into their worship. Anyone who has stood within the circle of Mitchell's Fold and looked on the panorama of hills around can well believe with what emotion those who erected it would greet the first beams of the orb of day as it rose above the eastern heights, and excuse them if they adored it as their god. Superstition, no doubt—a time of ignorance, no doubt—but such as the great Creator winked at. It is, to my thinking at least, a pleasant fancy that our rude forefathers saw in the sun the highest effulgence of the Divine glory. Let us leave them waiting for the dawn.

SOCIETY OF ORDAINED SURVEYORS.

THE general examining board of the Scottish Society of Ordained Surveyors has issued its report for the session 1906-7. For the preliminary examination there were as usual two diets of examination held during the year—in April and October. Seven candidates in all were examined, of whom four were for re-examination. Of the seven examined five candidates are now through the examination. There were three diets of the final examination held during the session. One candidate came forward at the April diet for the second division and passed therein. At the October diet one candidate came forward for the first division and failed. One candidate came forward at a special diet in January for examination in both divisions, and succeeded in the first division but failed in the second division. During the year four indentures and three discharges have been registered. The Council, in its eighth annual report on the work of the past session, states that the draft modes of measurement for minor trades, after having been fully discussed and amended by the members at several special general meetings called for the purpose, were remitted to a committee to be revised and completed, and afterwards submitted to

the Society for the final approval of the members before printing. The draft "table of fees" has now been printed and circulated among the members for perusal, and a special general meeting is being called for the same.

SCOTTISH NATIONAL GALLERIES.

THE Secretary for Scotland has appointed the following to be the members of the Board of Trustees for the National Galleries of Scotland, which is to be established as from April 1:—Sir Thomas D. Gibson Carmichael (chairman), Sir John Stirling-Maxwell, Sir James Guthrie, Lord Provost of Edinburgh, Lord Provost of Glasgow, Mr. James Murray, M.P., Mr. John Ritchie Findlay.

The National Galleries of Scotland Act, under which the trustees have been appointed, provides that a board shall be established to manage the Scottish National Galleries and for other purposes connected with the promotion of the fine arts in Scotland. The duties hitherto undertaken by the Board of Trustees for Manufactures in Scotland will be entrusted to the new board, and the buildings presently vested in the Board of Manufactures, known as the Royal Institution, the National Gallery, the National Portrait Gallery, and Dunblane Cathedral, shall be vested in the Commissioners of Works, in the case of the two first-mentioned buildings for such purposes as may, with the consent of the Treasury, be prescribed. As, however, the Town Council of Edinburgh have resolved to establish a municipal school of art in Edinburgh, and have agreed to take over, as from April 1, the management of the School of Art presently carried on by the Board of Manufactures, the Secretary for Scotland prescribes that—"From the powers, duties and liabilities vested in, or imposed on, the Board of Manufactures by any letters patent, Treasury minute, deed, or other instrument, which shall be vested in, transferred to and imposed on the Board, shall be excepted the powers and duties vested in or imposed on the Board of Manufactures for carrying on a school of art."

ST. MARY-LE-BOW AND ST. STEPHEN, WALBROOK.*

ST. MARY-LE-BOW Church is one of ancient foundation, although the present building only dates from 1671. John Stow, as is usual with him, tells us much about the earlier church. He died some sixty years before the Great Fire of London, so that we have the advantage of learning from his "Survey of London" many things about the churches which the fire destroyed. One important matter, however, we always miss in his writings. We are not able to picture from their perusal the architectural character and the ornamental Gothic details which abounded. We can only judge from the examples which are left to us that ecclesiastical London, in a structural sense, was a city of infinite architectural beauty. Stow tells us that "St. Mary Bow in the reign of William Conqueror, being the first in this city built on arches of stone, was therefore called New Mary Church, of St. Mary de Arcubus, or Le Bow, in West Cheaping." He instances a similar example of the use of the word "Bow" in Stratford bridge, which was built by Henry I's queen, Matilda, with arches of stone, and was thus called Stratford-le-Bow. The antiquity of the Court of Arches may be judged from the fact that John Stow mentions it; he says that the Court "is kept in this church, and taketh name of the place, not the place of the Court; but of what antiquity or continuation that Court hath there continued I cannot learn." The older church had its vicissitudes. In the year 1090 the roof was blown over by the wind, and several persons were killed; four of the rafters, in length 26 feet, "with such violence were pitched in the ground of the High Street, that scanty 4 feet of them remained above ground, which were fain to be cut even with the ground, because they could not be plucked out, for the City of London was not then paved, and a marish ground." Then again in 1196 a certain person of seditious tendencies, possessing an aristocratic name, William Fitz Osbert, seized upon Bow steeple, and fortified it with munitions and victuals. But his triumphant defence was short-lived; fire and smoke were brought to the aid of the attacking forces and bloodshed ensued, and his inglorious career was ended by hanging at Smithfield Elms, whither he was dragged by the heels.

Again in 1271 disaster occurred to Bow Church, when a great part of the steeple collapsed, killing many men and women. In 1284 one Laurence Duckett, a goldsmith, came

* A paper read at a meeting of the Upper Norwood Athenæum by Mr. T. Pitt, F.C.S.

into collision with one Ralph Crepin in West Cheap, and having grievously wounded him, fled into Bow Church. Ralph Crepin's friends entered the church at night and killed Duckett by hanging, after which they hung him up in such a manner as to suggest suicide; in fact, this view of the matter was taken at the inquisition (or inquest, as we should call it now), and Duckett's body was dragged by the feet to a ditch without the City for burial there. But the truth of the matter afterwards came out, and Jordan Goodcheape, Ralph Crepin, Gilbert Clarke and Geoffrey Clarke were attainted, a certain woman named Alice, the chief cause of the mischief, was burnt, and sixteen men were drawn and hanged, besides others that, after long imprisonment, were "hanged by the purse." The body of Duckett was taken up and buried in the churchyard, and the building itself was interdicted, the windows and doors being stopped up with thorns. We have said that the steeple fell in 1271, and it appears from Stow's record that the rebuilding was only partial at first and was gradually added to until at length, in 1469, it was ordained by Common Council that the Bow bell should be nightly rung at nine of the clock. Then John Donner, mercer, by his will of 1472, left two tenements in Hosier Lane for the maintenance of Bow bell. The couplet relative to the late ringing of Bow bell has often been quoted: here is what John Stow says regarding it:—"This bell being usually rung somewhat late, as seemed to the young men 'prentices and other in Cheap, they made and set up a rhyme against the clerk, as followeth:—

Clarke of the Bow bell with the yellow locks,
For thy late ringing thy head shall have knocks.

Whereunto the clerk replying, wrote:—

Children of Cheape, hold you all still,
For you shall have the Bow bell rung at your will."

Among the generous givers to the fund for repairing the old steeple were Robert Harding, goldsmith, sheriff in 1478, 40*l.*; John Haw, mercer, 10*l.*; Dr. Allen 4*l.*, and Thomas Baldry 4*l.* The steeple was finished in 1512, and the arches were constructed of Caen stone, which was delivered at the customers' quay for 4*s.* 8*d.* the ton.

The names of City men of standing are always interesting, and, in addition to those already given, Stow tells us that the following were buried in the old church and had monuments there:—Sir John Coventry, mercer, mayor 1425; Richard Lambert, alderman; Nicholas Alwine, mercer, mayor 1499; Robert Harding, goldsmith, sheriff 1478; John Loke, sheriff 1461; Edward Bankes, haberdasher, alderman 1566; John Warde; William Pierson, scrivener and attorney in the Common Pleas; Ade de Buke, hatter.

A stone building called a "seldam," or shed, was erected by King Edward III. on the north side of the church facing Cheapside, then known as West Cheap. The object of this structure was to enable the king and his court to witness the jousts and processions which were frequently held in those days. It was probably not without reference to that fact that the present external gallery in the tower facing Cheapside was constructed.

Writing upon the subject of ancient crypts in the "Transactions Cambridge Camden Society" in 1840, Mr. Benjamin Webb, afterwards the Rev. Prebendary Webb, M.A., F.S.A., remarks that of the crypts which escaped the flames in the Great Fire many have since been restored and many more lost sight of. He refers to the following as perhaps the most interesting of such as remain—one beneath the chapel of St. James on the Wall, one beneath St. Mary-le-Bow Church, one in Aldgate beneath a private house, one in Corbel Court, Gracechurch Street, one beneath the chapel of St. Etheldreda, and one beneath Gerrard's Hall in Basing Lane. Only two of these crypts remain. Of the crypt of Bow Church Mr. George Gwilt, F.S.A., writing in 1835, thus describes the structure:—"The walls of this crypt remain nearly entire. It is divided into three portions; the centre or nave is 48 feet 7 inches long from east to west by 26 feet 7 inches wide. On either side extends an aisle or corridor the same length as the nave, by 14 feet 5 inches wide. The whole extent of this crypt covers a space 78 feet by 60 feet. Communications between each of the aisles and the nave are obtained by four lofty doorways on each side, each 4 feet wide. The walls, which are over 5 feet thick, are carried up to the springing line of the arches in neat and regular courses of block and block masonry. Above that line they are of rubble intermixed with Roman brick. The groined arches are mostly of an elliptic form, but those in the nave, which turn from north to south, are

semicircles, somewhat elevated above the springing levels. The arches and ribs are turned with rubble masonry and Roman brick, and appear to have been originally stuccoed or plastered over. Four windows may be distinctly traced in the most northern wall towards Cheapside, although they are now masoned up, and one at the end of the nave. Three of the columns remain, the other three, with their superincumbent arches, have been removed. The columns which remain are destitute of decoration to their capitals, but they approach nearer to the lofty porches of the Lombardic style of the eleventh and twelfth centuries than generally occurs in similar buildings of that period in this country."

The tower of the earlier church was surmounted by four pinnacles from which flying buttresses supported a central pinnacle. This probably suggested the idea to Wren, which led to his adopting a similar plan in the construction of the tower and spire of St. Dunstan-in-the-East.

The church was the first to be rebuilt after the Great Fire, although repairs to St. Sepulchre and St. Christopher, Threadneedle Street, were commenced in the previous year, 1670; in these cases rebuilding was not necessary. Four other churches in the immediate neighbourhood of St. Mary-le-Bow have disappeared, and the parishes are now united: they are Allhallows, Honey Lane; Allhallows, Bread Street; St. John Evangelist, and St. Pancras, Soper Lane. The association of John Milton with Allhallows, Bread Street, is recorded on a tablet placed on the house

ST. MARY-LE-BOW.

which occupies the site of that church, with a medallion having the poet's head in relief. Another tablet, which was placed on Allhallows Church early in the nineteenth century was removed in 1876, when that church was destroyed, and placed on the west wall of St. Mary-le-Bow. It records the poet's birth in Bread Street on Friday, December, 9, 1608, and his baptism in Allhallows, Bread Street, in the same month.

The present tower of St. Mary-le-Bow consists first of a plain square tower 32 feet 6 inches wide by 83 feet in height, above which are four storeys averaging 38 feet each: the first, a square belfry, adorned with Ionic pilasters, is 39 feet; the next, which includes the beautiful circular peristyle of twelve Corinthian columns, is 37 feet; the third comprehends the small lantern, and is 38 feet high, which is also the height of the spire, the whole making a height of 235 feet (Fergusson). The spire is surmounted by the famous dragon, of which it was predicted that "when the dragon on Bow Church kisses the cock behind the Exchange great changes will take place in England." This actually happened in 1832, when the two figures were down and cheek by jowl in the repairer's yard. Then came the Reform Bill.

St. Stephen, Walbrook.

The author of the "Survey of London" records two churches of St. Stephen, Walbrook; the present building is a third. Writing in 1598, he says that "the fair church of St. Stephen was lately built on the east side of the street called Walbrook, for the old church stood on the west side, in place where now standeth the parsonage house, and therefore so much nearer the brook, even on the bank." He does not tell us anything about the first church, but gives the history of the one standing in his own day. Robert Chichley, who was mayor in the year 1428, gave the land for the building of this church, 208 feet by 66 feet, and had the privilege of laying the first stone. He further gave 100*l.* towards the cost and gave the timber for the procession way and the aisles, and also the lead. The church, which was finished in 1439, was 125 feet long by 67 feet. In Stow's time it contained monuments to Thomas Southwell, first parson of the new church, who was buried in the choir; John Dunstable, "master of astronomy and music," 1453; Sir Richard Lee, mayor; Rowland Hill, mayor in 1549; Sir Thomas Pope, first treasurer of the augmentations, with his wife Dame Margaret; Sir John Cootes, mayor in 1542; Sir John Yorke, knight, merchant taylor, 1549; Dr. Owen, physician to King Henry VIII. Robert Chichley added to his other benefactions a proviso in his will that on his mind day (the anniversary of his death) a competent dinner should be ordained for 2,400 poor men, householders of the City, and every man to have twopence in money. He was brother to "Herry Chechile," archbishop of Canter-

while 26*l.* were received for lead washed out of the ruins. Sir Christopher Wren rebuilt the church in 1672, and it is considered to be his most successful work after the cathedral. A loan of 500*l.* was obtained from the Chamber of London, and Sir Christopher was entertained to dinner at the Old Swan in Fish Street by the vestry, while a gratuity of 20 guineas was given to the Surveyor-General's lady for encouraging and hastening the rebuilding. The patronage of the living had come into the hands of the Grocers' Company, and their arms occur in the panelling; in December 1672 the court of assistants of the company were invited to attend the first stone-laying on the 17th of that month. The stones were laid by Sir Robert Hanson, Lord Mayor, Sir Thomas Chitchley (of the Privy Council) and Sir John Robinson (Lieutenant of the Tower). Sir Thomas Chitchley was a descendant of the Chichley who founded the previous church, he gave 100*l.* to the building fund. How the new structure pleased the vestry may be judged from the record that they ordered in 1673 that Dr. Christopher Wren, "in consideration of his great care and extraordinary pains taken in the contriving the design of the church and assisting in the rebuilding the same, be presented him or his lady 20 guineas in a silk purse; and Mr. Woodrofe, the surveyor, with 5 guineas, and that they both be invited and desired to dine with the vestry at the Swan in Old Fish Street the next vestry day, which is appointed this day fortnight."

The church is an oblong, or parallelogram, in plan, and since the floor is 6 feet 6 inches above the street level, it is reached from Walbrook by a flight of stone steps. The building has five aisles or arcades in width and six in

ST. STEPHEN, WALBROOK.

bury at that date. Henry Chichley was himself rector of St. Stephen, Walbrook, from March 30, 1396, to September 10, 1397.

Born at Higham Ferrers, he was educated at Winchester and New College, Oxford, and after diligent study of canon and civil law, took the degree of doctor in that faculty. His first preferment seems to have been St. Stephen's, from whence he migrated to Salisbury, becoming archdeacon in that diocese. King Henry IV. took notice of his eminent qualifications, and sent him as ambassador-extraordinary to Pope Gregory XII. at Sienna. This pope made him bishop of St. Davids and consecrated him with his own hands, and in 1414 he was translated to Canterbury, which archbishopric he held for twenty-nine years.

Another notable personage who held the living of St. Stephen's was John, afterwards archbishop of Thebes and ultimately bishop of Carlisle. He died in 1537 and was buried at Stebenhithe (Stepney).

The parish accounts and vestry minutes of St. Stephen, Walbrook, are unusually interesting specimens of their kind, and their pith is contained in two articles by Mr. Thomas Milbourn in the "Trans. London and Middlesex Arch. Society," vol. v., and in the "Trans. St. Paul's Ecclesiological Society," vol. i. From these it does not appear that any record was made of the stirring days of 1665 and 1666, when the Great Plague and the Great Fire ravaged the City in turn. The church was destroyed in the fire, and *l.* were paid for pulling down the wall "next Mr. Polexfens,"

length, arranged by the columns. The latter, supporting the dome, are arranged to form the nave, side aisles, transept and chancel. The entrance porch has a plain ceiling in one compartment, with bold cornice; the doorway into church from top of steps has a kneed architrave, ornamented with side scrolls which support the cornice; in the frieze a head keystone and drapery. The great piers are Corinthian, being plain shafts resting upon octangular pedestals, supporting an exceedingly rich foliated entablature on which spring the groins of the arcades; the soffit of the arch has a rich border of fruit and flowers. The several arcades that diverge and fill the entire scene (within them the various windows, both circular-headed and oval), set in complete view the dome. This is divided into eight great compartments, each containing semi-compartments filled with palm-wreaths, roses and other ornaments. There is a circular lantern in the centre of the dome. As in most of the City churches, carved woodwork is plentiful; here there is wainscot panelling, a west screen and gallery, the pulpit and sounding-board and a very interesting font cover. The glass in the east window was inserted by the Grocers' Company in 1851. It is by Willament. That in the other windows, by Gibbs, was put in in 1862 as a memorial to Dr. Croly, a former rector of some note. The organ was built in 1765 by England, but was taken out and re-erected in St. Bartholomew the Great a few years ago.

The large picture of the Martyrdom of St. Stephen is by West.

A "RAPHAEL" OR A FORGERY?

THE following memorandum respecting a painting in the National Gallery which is alleged to be a modern forgery has been addressed to the Trustees by Sir E. J. Poynter, P.R.A. :—

70 Addison Road, Kensington, W. : March 1907.

As an attack has been made on me in the *Athenæum* containing some serious misrepresentations with reference to a picture of the school of Perugino in the National Gallery representing the Baptism of Christ (No. 1,431 in the catalogue), and as the Trustees may have seen the letters in the *Athenæum* (which were copied into some of the daily papers) without having seen my reply, and may think in consequence that the statements as to the picture being a modern forgery may be true, I think it advisable to write a short account of the transaction connected with the picture to circulate among the Trustees and others who may be interested in the matter.

The picture in question was purchased by me in Rome in 1894, and was attributed to Perugino.

I need hardly say that the picture is unmistakably a genuine work of the Umbrian School of about the year 1500.

I did not absolutely accept the picture, which was covered with an old varnish which had become very yellow by time, as by Perugino himself, although undoubtedly of his school, and before purchasing it I went several times to the Vatican Gallery, where there are several works by Perugino and his scholars and followers, and came to the conclusion that, although not certainly by the master himself, so beautiful a little work would be a valuable addition to the national collection; and I decided to purchase the picture. Before placing it in the Gallery, however, I was able to compare with it the photograph of a similar picture which had a few years previously been offered to Sir Frederick Burton as a gift to the collection by Mr. G. F. de Zoete, and which had been placed for a time in the Gallery. But Sir Frederick Burton, ultimately coming to the conclusion that Mr. de Zoete's gift was not by the master (Timoteo Viti) to whom it was attributed, asked Mr. de Zoete to take it back and give another picture in its place, which Mr. de Zoete was good enough to do. The photograph showed what, indeed, I had no doubt of, that the picture which I had purchased was not the picture which had been offered to Sir Frederick Burton.

The result of my examination of the works of the school of Perugino in the Vatican Museum was to lead me to the conclusion that the picture which was offered to me for purchase might be the work of the young Raphael, certain of his peculiarities being very marked in it. As, however, some qualities which we generally find in his work are less conspicuous, I did not feel sure enough of the attribution to catalogue it under the name of Raphael, but gave it the name under which I had purchased it; in the next edition of the catalogue, however, I classed it as "ascribed to" Perugino, a phrase which, as every one knows, means that a picture has with some degree of reason been attributed to a master, but that the authorities of the National Gallery do not fully accept the attribution. Since then I have had further reason to believe that my attribution to the young Raphael may be nearer the mark, but I should not even now like to be positive on the point.

On January 26 of this year a letter appeared in the *Athenæum* from a certain Mr. Fisher, stating that a picture of the Baptism of Christ acquired for the National Gallery in 1894 and ascribed to Perugino in the catalogue is the same picture as had been offered to Sir Frederick Burton, and had, after hanging in the Gallery for some weeks, been rejected, after he (Mr. Fisher) had pointed out that it was a forgery by a modern imitator of old masters named Micheli. Mr. Fisher did not mention me by name, but as he said that he need not say that it was not Sir Frederick Burton who had bought the picture now in the Gallery, and as I was Director in 1894, the accusation was plain enough that I had purchased for the National Gallery, under the name of Perugino, a modern forgery which had already been rejected by my predecessor only a few years previously. Why Mr. Fisher waited thirteen years to point this out it would be hard to say. Lord Carlisle called my attention to this letter, and thought it advisable that I should reply to it; and as Mr. Fisher's letter was a misstatement of fact, and not merely an expression of opinion, of which I should have taken no notice, I acted on Lord Carlisle's suggestion; but it was then too late for a letter to be written for insertion in the *Athenæum* that week, and as I thought it probable that Mr. de Zoete would either be still in possession of the

picture, or would know where it was if he had parted with it, I wrote to him at once.

Meantime a second article of a vituperative nature, following up Mr. Fisher's attack, and mentioning me freely by name, appeared on February 2 from the pen of Mr. Brockwell, who seems to be the "Art Critic" of the *Athenæum*. I waited next week till the last moment in hope of a reply from Mr. de Zoete before writing to the editor of the *Athenæum*, but receiving none, I sent a letter, briefly stating that the picture in the National Gallery is not Mr. de Zoete's picture at all; and as I felt pretty sure that Mr. Fisher's next move, when his blunder was shown up, would be to assert that the picture in the Gallery is, therefore, another forgery, I added some details concerning the removal of the varnish by Mr. Dyer, which showed that the picture, of which the tempera had become as hard as flint, was undoubtedly of many centuries' standing (which, I may add in parenthesis, did not stop Mr. Fisher from making, on the following Saturday, the assertion which I had anticipated).

The day after I had sent my letter to the *Athenæum* (which was printed on February 9) I received a letter from Mr. de Zoete telling me that the picture which he had offered to Sir Frederick Burton had been in his possession until last spring, when he had presented it to the museum at Canterbury, where it now is, and adding that he had written to the editor of the *Athenæum* to that effect. This letter, which would have effectually exposed the egregious blunder which Mr. Fisher had made, and shown up the incompetence of their "Art Critic," the editor of the *Athenæum* thought fit to suppress, although he allowed further letters from Mr. Fisher and from Mr. Brockwell to appear on the following Saturday, in which they made a painful attempt to exculpate themselves, while he, at the same time, intimated that the correspondence must cease.

I should add that the reason of the delay in Mr. de Zoete's reply was that I misdirected my inquiry in the first instance, and it was two or three days before I found the right address.

The Trustees of the National Gallery may, I think, rest assured that the picture which is the subject of this letter is a perfectly genuine work by a scholar of Perugino, probably done in his studio, and, in my opinion, possibly by the young Raphael. The most characteristic point, besides the beautiful painting of the figure of the Saviour, is the drawing of the hands, which is precisely Raphael's. I made drawings of the hands in the early predella pictures by Raphael in the Vatican and the method of treatment is identical and peculiar to Raphael. On the other hand, the heads are not specially Raphaellesque, nor is the colour as pure and transparent as is usual even in his early work; at the same time such characteristics as do not agree with what we know of his work might possibly be due to its being a youthful performance. I mentioned that I had since found further reason to think that Raphael may have been the painter of our picture. The painting of the trees is quite peculiar and different from the treatment to be found in the works of Perugino, or, indeed, of any work of the school that I had seen. Some two or three years afterwards I saw the predella painting of "St. John Preaching," by Raphael, belonging to the Marquis of Lansdowne, and was very interested to find in it the same treatment of the leaves of the trees—that is to say, that instead of the minute and delicate sprays of foliage, so characteristic of Perugino's own work and of, as far as I know, most of his followers, the trees have only a few sprays of large and freely painted leaves. This appears to be some confirmation of my view.

Mr. Heseltine informs me that a foreign critic pointed out to him that the picture is probably a work of the young Raphael.

EDWARD J. POYNTER.

Mr. de Zoete's letter to the editor of the *Athenæum*, which was not published, contains the following passage:—"Thenceforward" (that is, after the picture offered to Sir Frederick Burton had been returned to him), "down to the spring of last year, when I presented it to the city of Canterbury, that painting never left my possession, though Mr. Fisher and his unnamed friend are treating as identical with it the picture now in the National Gallery (No. 1,431). They would, therefore, appear to be incapable of distinguishing one artist from another, for the painting now in the National Gallery and the one I gave are entirely different in touch."

An article by M. Durand-Gréville, in the *Bulletin de l'Art Ancien et Moderne*, p. 70, of apparently the week ending February 16 (I have only an undated cutting from the paper), is an independent support to my view that the little work in the National Gallery may be by Raphael.

KING EDWARD'S SCHOOL, BIRMINGHAM.

THE history of Birmingham's premier school dates back far beyond the reign of Edward VI. Indeed, it was in the last years of the fourteenth century that the public spirit of certain citizens of the market town of Brynmyncham first laid the foundations for one of the finest educational establishments in the country.

True, the founders of the "Gild of the Holy Cross" had no thought of schools or scholars in their minds when they gave of their substance to establish that brotherhood; yet the King Edward VI.'s School of Birmingham is the direct descendant of the guild which was founded in August 1392, and which in 1536, out of its revenues of 31*l.* per annum, maintained three priests (at a stipend of 5*l.* 6*s.* 8*d.* each) and several subordinate officers, and which had spent its surplus income in the commendable, though purely secular, work of the "reparycion of certain brydges and highways." The charges for this "reparycion," says the *Birmingham Daily Post*, fell at the dissolution of religious houses upon the townsmen, and they, desirous of obtaining some return for their new liabilities, petitioned for a restoration of the funds to the town in the shape of an educational establishment.

After a very considerable delay their petition was answered, a charter for the establishment of "a Grammar school" was granted on January 2, 1552, certain lands of a small yearly value were given to the new foundation, and the Guildhall, situate "on the turnpike road leading to Halesowen," was thenceforward to be used as a school, one master and one usher being appointed, and "twenty men of the more discreet and trusty inhabitants" being nominated as governors. Birmingham then was a place of about 700 houses and a population of, perhaps, 3,500; and this, apparently, was the first school that had ever been established here—such education as its inhabitants had formerly possessed having been given by the clergy.

History is silent as to the conduct of the school for some years after its foundation. Indeed, it is not until a century later that any exact records can be obtained. In 1654 the master was in receipt of a stipend of 40*l.* per annum. Twenty-two years later this had been increased to 68*l.* 15*s.* and a house adjacent to the school. In the same year (1676) the usher was paid 34*l.* 6*s.* 8*d.* and was granted the use of a house in Moor Street. Probably "the usher" in this year was Mr. Joseph Withers, as to whose appointment, in 1673, the records relate that he was examined by "three able divines," for whose modest entertainment at the Swan 2*l.* 9*s.* 4*d.* was paid by the governors. Prior to this, in 1667, the 200 boys on the foundation arose in force and "barred out" the master. This was a memorable occasion and long regarded by the Edwardians as one of the glorious traditions of their school's history. About this time the funds appear to have been very badly mismanaged, and in 1685, as the result of serious and continued disputes between the governors, a new charter was obtained but never enforced. This mismanagement appears to have continued throughout the Hanoverian period, and in 1824, when 100 boys were on the foundation, and the income amounted to 3,000*l.*, someone wrote of the school as "a nest of peculation."

Exactly 200 years ago, in 1707, the ancient Guildhall, a timber-framed structure of which (did it exist to-day) the city would be extremely proud, was pulled down, and the "old" Grammar school—a curious quadrangular building of red brick, in the approved architecture of the Queen Anne period—was erected on the site. This was subsequently "beautified" by a range of urns above its balustrade, and by a statue of Edward VI., for which Sir William Wilson, Sutton Coldfield's native sculptor, was paid 25*l.* in 1718. Doubtless the new building was, in many ways, an improvement upon the Guildhall, but it was as a shell without a kernel, for in 1734 it was reported that "the chief master had no scholars under his care." Perhaps he occupied his leisure by admiring the "picture of ye royal founder, King Edward VI.," and its admirable frame, for which, in 1682, the governors paid the respective sums of 2*l.* and 3*l.* 9*s.* 6*d.* Or, may be, he spent his time in longing for those good days of which he would read in the school accounts, as for instance:—

1679. Two quarts of sack, part of examiner's entertainment . . . 4*s.* 8*d.*

1706. Paid for wine to treat the bishop . . . 8*s.* 6*d.*

The old school may still, perhaps, be remembered by a few Birmingham people. It was pulled down in 1833, when the present handsome building, designed by Sir Charles Barry, the architect of the Houses of Parliament, was erected at a cost of 40,000*l.*

HOLYROOD CHAPEL.

THE restoration of the Chapel Royal, Holyrood, has been considered by the Building Trades Exchange of the City and District of Edinburgh and the Edinburgh, Leith and District Building Trades Association. A joint committee was appointed to make an examination of the structure. At a meeting on March 26 the following report was submitted and adopted:—

In pursuance of the instructions given to them the joint committee (twelve in number) visited the Chapel Royal on Thursdays, March 14 and 21, and, having carefully examined the building as it exists, they beg to report as follows:—

1. *South Arcade and Wall Above.*—The height of this wall is 42 feet 6 inches from the ground and it is 4½ feet thick. At a point nearly opposite the centre of the nave it has at wallhead an inclination inwards to the extent of about 14 inches. From this point the inclination lessens as it approaches the respective ends. The whole of this masonry shows slight decay on the surface; although patched with cement at some parts, it is otherwise in good condition. The enforced curvature inwards forms a sort of arch favourable to the reintroduction of the great vault, which, once in position, would be the most effectual means of preventing further movement.

2. *East Gable.*—This wall is not exactly vertical. The lower portion inclines slightly outwards and the top portion inwards. Considering its thickness, and the fact that its share of proposed load would be quite inconsiderable, there can be no question as to its reliability. The remarks in (1) as to decay on surface apply here also.

3. *North Wall.*—This wall is 27 feet high by 3 feet 3 inches thick, and inclines outwards to the extent of about 3½ inches; there is, however, ample evidence of the fact that this inclination is of old standing, and that the subsequent erection against the wall of seven buttresses, each 6 feet 9 inches by 4 feet 2 inches on plan over base, has been sufficient to prevent further movement. The wall itself is in good condition and the buttresses especially so.

4. *North Pillars of Arcade.*—The north pillars need not be specially referred to, seeing that only a portion of two remains.

5. *West or Front Wall.*—This gable, which has its lower portion 10 feet thick (above base course) and the upper portion 6 feet thick, inclines outwards about 4 inches. The 6 feet thick upper portion referred to being to the inside of wall counteracts any tendency to further inclination outwards, and heightening the wall and giving it a share of load from roof could not operate prejudicially in any way.

6. *South Buttresses.*—There are two sets of buttresses on this side of the building. The lower ones, 10 feet in advance of the aisle wall, are, along with the flying arches, in good order; the tops of these buttresses have been removed presumably because they interfered with the view from the palace windows. The upper buttresses on top of aisle wall remain intact with one trifling exception.

Observation on the Foregoing.

1. The masonry of south pillars (seven in number) may each be taken as having above base level a superficial area of about 14 feet. Having regard to the safe carrying load per square foot of bearing surface applicable to stone in masonry, it appears to us that these pillars as they stand can safely receive a load much greater than any complete restoration of the chapel could possibly bring to bear upon them.

2, 3, 5, 6. The foregoing observation as to safe load applies equally to these sections.

Generally.—Our examination of the building and full consideration of the whole subject enable us to report that no question of weakness or instability in respect to the existing walls can be seriously entertained; that restoration of the chapel can with safety be effected, and would permanently secure the preservation of these walls; and that, with careful handling, a structure could be produced worthy of the historic memories attaching to this ancient chapel.

Adopted by and signed for and on behalf of the Council of the Building Trades Exchange of the City and District of Edinburgh, and the Edinburgh, Leith and District Building Trades Association.

PATRICK KNOX, president, Building Trades Association.

W. GRAHAM-YOOLL, president, Building Trades Exchange.

JAMES CAMERON, Secretary.

Edinburgh: March 26.

MODERN LANDSCAPE ART.

AN address was delivered at the opening of the exhibition of the Dundee Art Society by Mr. D. Y. Cameron, A.R.S.A., entitled "Some Thoughts on Natural Beauty with Reference to Modern Landscape Art." He began by remarking that the practice which prevailed in Dundee of having its annual exhibition opened with an address on some art topic was unique and interesting. It was a practice which he had not heard of elsewhere, and showed that the people of Dundee were interested in art and art thoughts to an exceptional degree. It also proved that the people of Dundee were an intellectual people, and he felt that he was now addressing the art, intellect and last, but not least, the beauty of Dundee, and was therefore in a very difficult position. The quest after beauty, he said, must be the first prompting in the true artist's work, and the desire to reproduce beauty was what led some—perhaps the world said far too many—to depart from the ordinary ways of men and follow art in their desire to exhibit to others their sense of the beautiful. This line of beauty showed itself early in nearly all—a fact which would suggest that if education could be so adapted as to develop and not, as it frequently did, retard this natural love, then all would have a joy added to their lives and be able to realise more fully the overflowing beauties of the fair world in which we live. Of old the great beauty of the world was one of the strongest arguments for the existence of God. Men realised that there must be a Divine source from which all this glory of the earth found birth. Was this argument any less potent in our time? Mere evolution could never have given to us the world of beauty we knew, and all the earth and all upon the earth must recognise in our cup of beauty which runneth over the master hand of the Supreme Artist. The vision of beauty as seen in modern days was a very different one from that of the ancients, and they had but to study old and new art to see how great was the difference. The landscapes of the old masters, judged by modern standards of natural truth, were oftentimes impossible, formal and conventional, but, in spite of this, full of that mental distinction and sense of style without which a picture might be interesting but never impressive, and very seldom great. There was in these old landscapes a pure and restful liveliness—rare and refined in their beauty, and with that holy reverence for pure colour which made them always a memory of gladness. To-day the calm had given way to restlessness and experimentalism, with little trace of that distinction so universal in the past. But if it lacked some qualities, it had other and very precious ones. The beauty sought after in recent times was of that intimate character which showed real study and very often deep knowledge. The painter sought for the beauty which was real, not formal, and full of nature's variety. Perhaps the photograph had influenced it as it had done portrait-painting, and taken something of the poetry away and denied it something of the rarer beauty of the dreamer's vision. The true landscape-painter was not necessarily a reproducer of the well-known spots beloved by the tourist. He should not be a superior kind of photographer, but rather an interpreter—a student of the moods of nature, a painter of the landscape of dreams—if he was truly to move men. Nature was his great mistress, from whom he must extract all the secrets he could, and lavish on her all his love. They could not overestimate the great part which imagination had played and must play in the world. It was the mover and inspirer of men, and an age without great imaginative men and leaders was not likely to be a fruitful one. If this be so in the great world of action, it was none the less true in the world of art, where without imagination linked to an over-mastering sense of beauty the finest could not be accomplished. Would that they had more of these qualities exhibited in their picture galleries. It would be well if from the rush and jostle of the active world men could turn aside for a little and find among pictures the beauty and refreshing their souls must often crave after, for was there not a voice even in the most material which called him aside to song and beauty? Art at its highest should always be the great revealer of beauty, the harbinger of joy, the messenger of hope. In the art world the greatest endeavour of the many schools for many years had been to realise light, for light was beauty and beauty was the end of art. So if they desired to enjoy the full glory of natural beauty they must open their hearts to nature's great message of love to man. They must ever be her lovers and worshippers, and hear her calls to love in the fragrant hours when she laid herself to rest in the holy hush when day passed into starry night,

and again when day all glorious leapt from out the darkness and light was over all the earth. The study of the life and works of Turner more than any other painter exhibits the evolution of landscape-painting from the older formulas and through varied lines until in that group of his latest work, now hung in the Tate Gallery, the highest chord ever yet attained is struck. They seem to go as far as ever paint can go in the rendering of light. Turner's power to awake the imagination, united to his overwhelming sense of beauty, leaves him thus far in the world's record unapproached in landscape art. If he has shown the wonders of light, in later days Whistler has cast the magic and spell of his art into the twilight and the night. His nocturnes are among the great creations of art of all time, and no one before had penetrated the night as he has done and found it was not darkness at all, but only the weirdness of veiled light. Turner and Whistler are supreme among the creators of beauty. They are the poetry and the music of modern art, the fruits of the love of nature expressed so richly in the finest literature of the last century. Art's highest achievement is to reveal beauty and to bring joy into life, to paint not the gloom of Salvator Rosa, but the glory of Turner and the mystery and magic of Whistler. Light is beauty and beauty is the end of art.

GENERAL.

The Municipal Council of Paris have purchased the *Adam and Eve* and several other works of the late M. Falguière, the sculptor. M. Carolus Duran has presented a portrait and M. Rodin a bust of the artist.

An Exhibition of old Umbrian art is to be opened in Perugia on the 22nd inst. and will be on view until November.

The London Geological Field Class has arranged its excursions for the study of the London district, under the direction of Professor Seeley, F.R.S., to begin on Saturday, April 27. Mr. J. W. Jarvis, St. Mark's College, Chelsea, S.W., is honorary secretary.

The Selection Sub-Committee of the Scottish Modern Art Association, which has been formed to secure representative specimens of contemporary Scottish art for the benefit of the nation, has purchased the landscape by E. A. Walton, R.S.A., at the Royal Glasgow Exhibition of Fine Art. The picture was awarded a gold medal at the International Exhibition at Munich last year. Mr. Walton belongs to the Glasgow school.

Mr. L. F. Vernon-Harcourt, M.A., M.Inst.C.E., was appointed external examiner in civil engineering at the last meeting of the Birmingham University Council.

Mr. W. A. Inderwick, on his retirement from the office of mayor of Winchelsea, has presented the original seal of the town to the Council. It was probably struck between A.D. 1280 and 1300.

Professor A. H. Church will deliver a lecture at the Royal Institution on the 12th inst., the subject being "Conservation of Historic Buildings and Frescoes."

M. Emile Bertone has been appointed architect to the Palais de l'Institut, Paris, in succession to M. Moyaux, who has reached the age limit.

The House No. 57 in the Rue d'Argout, Paris, is shortly to be demolished for the extension of the Rue de Louvre. It was there Charlotte Corday lodged prior to her assassination of Marat.

The Rochdale Corporation have decided to make a new street leading from the bottom of Blackwater Street to the Esplanade, at an estimated cost of 14,000*l*. This will effect a considerable improvement in the centre of the town.

Mr. Enoch Tempest, the contractor for the Walshaw Dean reservoir scheme of the Halifax Corporation, now nearing completion, has sent in a statement of claims for extras amounting to 77,606*l*. 9*s*. 7*d*. The waterworks committee have the claim under consideration.

The Lower Arcade (south side) of the lady chapel, together with apse, of the Liverpool Cathedral, is now complete, the masonry having reached a height of about 14 feet. The north side is being proceeded with. Adjoining this are two vestries, which lie between the chapel and the chapter-house and abut on the east wall of the main building. The vestry walls are already more than 8 feet high. A further and notable step in advance is the commencement of the superstructure of the main building, the part now in hand being the arcade and north and south walls of the choir.

THE WEEK.

GOLD medallions are not modern creations, although owing to the value of the material few of the earlier examples have survived. Professor WEIL at the last meeting of the Berlin Archæological Society described five which were discovered in Aboukir in 1902 and are now in the Royal Museum, Berlin. The only Greek examples known before 1902 were three in the Louvre, which were found at Tarsus in 1862. Recently others were obtained in Egypt. The medallions from Aboukir have portraits of ALEXANDER THE GREAT, who was the first to introduce an effigy of a living ruler on Greek coins. It is supposed they were presented to his victorious commanders after successful battles. The Roman emperors, in their imitation of Greek customs, it is believed occasionally adopted the practice of conferring similar medallions on rare occasions.

FROM the statement of the First Commissioner of Works on Monday, the restoration of Holyrood Abbey may be considered as abandoned. Mr. HARCOURT said they were taking the necessary steps for the preservation of the ruins, but as to the bequest by the late Earl of LEVEN AND MELVILLE for the restoration and rebuilding, that was a matter with which he was not personally or officially concerned. The bequest was left on the condition that the work should be carried out by a specific architect and two specific trustees, and failing the action of these trustees the legacy lapsed into the residue of the estate. Both trustees declined to act for reasons which they stated, and therefore the money cannot be available for any other purpose. That is a correct statement as far as it goes. But if the restoration as proposed by Lord LEVEN, according to the plans of Mr. Ross, could be shown to be reasonable, there would be little difficulty in applying the money to that purpose. There are no doubt rival interests in the case, and they have been the principal obstacle to the realisation of Lord LEVEN's last wishes.

As a sufficient sum of money was not collected to purchase Mr. HOLMAN HUNT's brilliant *Lady of Shalott*, the committee have had to be satisfied with *The Ship of the Painter*. The picture was suggested by the lines of "In Memoriam," about the fair ship which bore ARTHUR HALLAM's remains from Italy to England. Mr. HUNT gives the following account of its production:—"Deeply entranced by the poetry of a vessel traversing the globe under the immensity of stars, bearing its freight of human joys and woes, I undertook the picture on a peninsular and Oriental steamer which yet retained the method of steering immortalised by TENNYSON in his poem on the return of the body of HALLAM to "rest beneath the clover sod." I made elaborate studies both by night and day in preparation for the picture on board ship, and I painted it, while still all was fresh in my mind, when arriving in Jerusalem." It is a realistic representation of the deck of a steamer on a fine night, but it is not exactly the work which should be placed in the National Gallery as most characteristic of the artist's powers.

IN the French Salon which is about to be opened will be a collection of the decorative pottery of Sèvres, which was modelled in the eighteenth century. It may seem out of place among modern works of art, but there is no likelihood of the living exhibitors objecting to the rivalry. MARIE ANTOINETTE and the Princess LAMBALLE were especially interested in the royal pottery, and a large number of groups and statuettes were produced to please them. Many examples were placed in the

boudoirs of the Trianon, Versailles, Meudon, Marly and Fontainebleau. From the account books of Sèvres it appears that within a limited period there were no less than 620 independent productions of one class. Recent searches have been rewarded by the discovery of moulds for 585 of them. The remainder are supposed to have disappeared during the confusion which followed the invasions of 1814 and 1870. M. BAUMGART, the director at Sèvres, has selected 180 examples for the Salon, where they will receive unusual attention as recovered treasures.

EARLY in April of each year the prudent *bourgeois* in Paris repeats the stereotyped laments about the folly of men preferring art to trade, especially when they are unable to attain sufficient merit to secure admission for their pictures to the Salon. This year is no exception. The artists who can claim to be "hors concours"—about 2,000—are sufficiently numerous, without other aid, to fill the wall space of the galleries. Yet in addition 3,206 paintings were sent in by 1,603 artists. The jury could not find room for more than 905, or less than a third of the number submitted. In the rival Salon a similar, if not a greater, competition occurred. There is some reason, therefore, for men who are engaged in ordinary business to be amazed at the fascination which art exercises over men and women who are not possessed of extraordinary talents, but who submit to privations with the self-sacrifice of religious votaries. Those whose paintings are rejected are sure to imagine the jury were not impartial, but how can men consider the qualities of more than one hundred works per hour with any exactitude?

IT needs no great imagination to believe that before long REYER's noble opera "Salammbô" will be heard in Carthage, where the scenes are supposed to have occurred. There may be differences between archæologists concerning the site of the Phœnician capital, for both the original city and the Roman city which took its place are alike in ruins, as they were impartially treated by Byzantine and Arab hordes. But the excavations of BEULÉ, REINACH and DELATTRE have given more definiteness to the theory relating to one part of the vast waste. If excavations could be systematically conducted the question might be settled. At least the Musée Lavignerie would be enriched, whether the objects found were Phœnician or Roman. Meanwhile, the advantages of the coast remain. Not long since it was proposed to use the late Empress of AUSTRIA's "Achilleion" in Sicily for a marine hotel. The distance from that island or from Malta to the coast of Tunis is of little account. If, as has been suggested by a society in Tunis, a bathing establishment of the modern kind were once established on the site, there would be not only an end to further tampering with the remains, but an army of explorers would be created. If America were not so remote the enterprise of the travellers who visit Europe would soon accomplish wonders and give delightful surprises by discoveries.

THE venerable JOHANNES SCHILLING, the German sculptor, has become blind. He is in his seventy-ninth year, but at the time of his sudden affliction he was still actively occupied with his art. He will always be associated with the Franco-German war, for he executed several of the large memorials which were raised in various parts of the empire. His vigour was equal to the undertaking of colossal works. The *Germania* for the monument on the Niederwald is 34 feet in height. He executed the statues of the Emperor WILLIAM I. for Wiesbaden, Hamburg, Prenzlau, Dortmund, and others of BISMARCK and MOLTKE. Few artists have accomplished so much in a period of thirty years, and the recollection of his industry should console the artist in his darkness.

THE CHOICE OF MATERIALS.

ONE of the most perplexing of the modern architect's functions is the selection of suitable materials for the buildings he is called upon to design. And under the term materials we include specialised forms of construction which, from the architect's point of view, are the *materia aedificanda* of the structure he intends and expects to see "in being," as much as bricks, stones and timbers in their original simplicity.

Take, for example, the one item of thin partitions, of which there are more than a score at present on the market, illustrating the universal principle that no sooner does some ingenious inventor produce something new and useful than a crowd of imitators rush in with more or less barefaced copies, eager to share in the profits that the novelty promises.

The same thing has occurred with "enamel" paints, with sawdust and magnesian plaster floorings, with fire-resisting floors, and many other departments of the building trade.

How is an architect to choose judiciously between the rival claimants to his favour? The fact of an article being patented is of small value. British patents are too easily obtainable to admit of their serving as credentials, and most architects nowadays are sufficiently wide awake to know that "barking" patents are rampant in the building trade, and that as often as not the distinguishing feature of a patented article is a detriment rather than otherwise to its efficiency.

The consideration of price is undoubtedly one that has great influence on the decision of an architect, who frequently has behind him a client desirous of having his wants supplied at the lowest possible figure. Thus there is an excellent chance for the manufacturer who can produce something as good, or even nearly as good, as his rivals, but at a lower price.

Cost, however, is not by any means a paramount factor in many cases. It is an architect's duty and, in most instances, his desire to get the best value for his client's money, and he realises that it is often and, indeed, generally wiser to receive 10 per cent. better value for 5 per cent. increased outlay than to save the last halfpenny.

One important question then that the architect has to settle is that of value for money. The low-priced article is cheap if it answers the purpose perfectly, but if it does not do so it is no longer cheap but dear.

It is an axiom with many artistic and observant designers that from the æsthetic point of view the most suitable materials for the exterior of a building are those indigenous to the locality. Certainly a red-tile roof in Westmoreland or a red-brick front in a Cotswold village would jar upon our sense of fitness, partly, no doubt, from the force of association, but to some extent by reason of their lack of harmony with the feeling of the local landscape, in which not only the prevailing types of vegetation and foliage and the physical contours of the country are factors, but also the atmosphere, the moods of which, infinitely variable though they be, yet seem to be classified into sympathetic groups in different districts. As an illustration, where but in the eastern counties would CONSTABLE have found his especial rendering of cloud form and atmosphere? Sympathy with the environment provided by nature is thus one of the considerations that will guide the artistic architect in his choice of materials. Even green Westmoreland slates and red Fareham bricks are not everywhere beautiful, and however desirous the manufacturer or merchant may be of an universal market for his particular products, he must not be surprised at a want of appreciation on the part of artistic architects, even though the objector may be able to give no better reason than "I do not like it," or "I prefer so-and-so," for artistic judgment is very frequently a matter of instinct, or feeling, or sub-conscious mental activity, call it what you will; it is elusive and difficult to define, even apparently illogical.

Sympathy with environment is not the only matter

the artistic architect has to achieve in his choice of external material. There must also be harmony amongst the components of his design. If he has determined on a green-slate roof his walls must be in accord. If he intends to have red brick walls his roof must be adapted to their dominant tone. Not necessarily must they repeat the key, for there is harmony of contrast as well as of unison. The trader should therefore study or learn—the two are not synonymous—the particular classes of other materials with which his own are in accord, and play up to the disposition of the architects he hopes to number amongst his patrons. For instance, some natural stones have an excellent effect with red brick, but are execrable in conjunction with white bricks or stocks.

One thing the trader must not forget is that most modern architects are well aware that no one thing is universally applicable; that in building matters "So-and-so's pills" will not "cure every disease under the sun." If he has but one article to sell his market must be limited, and if he desires a more extended vogue for his productions he must vary their lines of applicability.

How is the architect to form a correct opinion as to the value for money of, say, the score and more of thin partitions that clamour for his adoption? He will naturally give weight to any tests that may have been made by reputable and recognised authorities. The reports of KIRKALDY, the British Fire Prevention Committee and other trustworthy investigators assist him in making a selection, and so it behoves all who have to sell specialised items of construction to submit their particular wares to test, for if some of their trade rivals can show results of successful tests, and they have not faced the ordeal, their pretensions and assertions are subject to considerable discount. True it is that there is a certain amount of gullibility amongst architects, and plenty of business has been done on that basis, but it is but an uncertain foundation for permanent success; and we could point out several instances of concerns that have, as it were, grown with the rapidity of JONAH's gourd and come to as untimely an end.

Although some architects have the good fortune to be always busy, yet even with them there are periods of more and less activity, whilst the rank and file, the majority, fluctuate between times of busy-ness and slackness.

We have heard of many instances of the slack times being employed for careful and often unobtrusive investigation by architects of various classes of specialised material and construction, and this certainly appears to us to be a wise way of utilising the quiet time, to study the choice of material. When the instructions for the design of a building have been received, there is usually a rush and bustle to approximate to the client's ideas of reasonable expedition. There is then no time to investigate and weigh carefully the merits of a score of rival forms of thin partition, whatever may be the particular class of material in question.

Obviously, then, it is during the architect's slack time that the manufacturer and merchant should redouble their activity. Then it is that their advertisements should be most prominent and persistent, that the travellers should be increased in number, that when the architect has time to listen the trader should be most intent upon obtaining a hearing.

As the present is beyond question a generally slack time for architects and contractors, we quite anticipate a more than usual number of visitors to the present Building Trades Exhibition and a greater devotion of time to it by those visitors. But the exhibitors must not be disappointed and disheartened if they do not book as many definite orders as on previous occasions. They must be content with sowing the seed and leaving the harvest for the future. It must not be forgotten that the seed will require watering and cultivation. The advertisements and the travellers must be kept going. Tact, however, is necessary. We were rather

amused at the scorn with which one of our architect friends showed us a card he had received from one of the exhibitors, with the request, "If you call, may we ask you to kindly hand this card to our attendant?" Why should he carry their card rather than anybody else's? If theirs, why not another hundred or two? Why should he load himself with lumber to please the exhibitors? Especially as this particular firm left him to utilise someone else's ticket of admission, we fear this exhibitor will not see our friend when he visits the exhibition.

JOHN STOW.

THE name of JOHN STOW is never likely to be forgotten, for is it not associated with the City of London, and where is a more enduring memorial? Yet the members of the London and Middlesex Archaeological Society, who on Saturday placed a wreath on his tomb in the church of St. Andrew Undershaft, and listened to an address concerning him were well inspired. At a time when celebrations of English worthies are common, JOHN STOW's labours merit to be recalled. He was the earliest of our topographical antiquaries, and he was endowed by nature with most of the qualities which were essential for the work he undertook. As architects we must regret he did not describe the impressions he received from the contemplation of the old buildings he saw around him in London, but if he were more emotional his statements might be received with less confidence.

It is believed he was born in 1525, somewhere in the parish of St. Michael, Corrhill. He was the son of a citizen who belonged to the Company of Merchant Taylors. He was also a tailor, and it was jestingly said that he "stitched up English history." An irresistible impulse compelled him when he was about forty to abandon a business which was likely to have been well established and profitable, in order to devote himself to collecting the records of his country, or, as he says, to address all his cares and cogitations to the studies of histories and search of antiquities, which he admits were for him "delectable studies."

According to STRYPE, it was at the suggestion of ROBERT DUDLEY, afterwards Earl of LEICESTER, that the "Summary of the Chronicles of England" from the time of BRUTE was commenced. His Lordship was a patron of literature, and we suppose rewarded Stow on accepting the book. But his aid could only be temporary, for it is evident from petitions addressed to the lord mayor, aldermen and commoners of London that Stow was in a state of poverty during the greater part of the time he was studying and writing. Besides the "Summary of the Chronicles," he printed an abridgment of it; he also wrote his "Flores Historiarum, or Annals of this Kingdom," and a continuation called "Annals, or a General Chronicle of England." For a time he was compelled to suspend his labours, as a rival chronicler appeared in RICHARD GRAFTON, the printer. Stow charged him with dishonest dealings and with reaping the fruits of his labours. The history of England may be said to have occupied JOHN STOW between 1562 and 1598. The toil required in the compilation of his books would have daunted any man who was not an enthusiast. In our time, when facilities are given, the study of ancient manuscripts is not an agreeable task. When Stow endeavoured to utilise them, it must have appeared like entering into chaos. He told his readers how, "painfully to my great cost and charges, and not for hire," he brought things to light out of many old hidden histories and true records of antiquity. If he asked for support it was in order to rescue other accounts of events from oblivion. One black-letter volume was only, as it were, the prelude to another, for no indifference on the part of his fellow-citizens could damp his ardour.

STOW was thirty-three when ELIZABETH came to the throne, and it might be supposed he would share in

the interest shown to literature, especially when he had the patronage of LEICESTER. The drama was the chief gainer, and the history of England was only acceptable when seen on the stage. As an antiquary Stow was supposed to be in favour of the old system which the TUDOR family had set aside, and on that account could not be approved by the Court party. He was regarded as a suspicious person, and a search was made in his house. It was found that by his own labours he had accumulated materials for his "Chronicles," that he possessed not only fabulous books and tracts relating to medicine and surgery, but fantastical Popish books printed in old times and others written in old English on parchment. Whether he suffered in consequence of his possessions is not known, but on a second ecclesiastical inquisition his property was confiscated. His brother was the principal witness against him, and it is no wonder that afterwards "he was very careless of scoffers, backbiters and detractors."

Between Stow's researches and the literature of the time there could be little in common. He sought truth above all things, and would be opposed to adaptations of it which were produced to please the groundlings. BEN JONSON said that "JOHN STOW had monstrous observations in his Chronicle," and in all ages it has been difficult to reconcile archæology with the necessities of the drama. It is strange that one of the few puzzles in the "Survey" relates to theatres. When describing Shoreditch, he wrote:—"And neare thereunto are builded two publique houses for the acting and shewe of comedies, tragedies and histories for recreation. Whereof one is called the Courtein, the other the Theatre; both standing on the south-west side towards the field." They are the only playhouses mentioned by him. Unquestionably there was a theatre in Shoreditch known as the Courtein, and the name survives in Curtain Road. But nothing is to be discovered about one known as the Theatre, unless a stage for open-air performances went by that name. Stow at least rendered one service to literature, for, as he relates, the works of CHAUCER, "the most famous poet of England," were by him "corrected and twice increased through mine own painful labours, and again beautified by me, collected out of divers records and monuments, as also explained the old and obscure words." His edition of CHAUCER appeared in 1597.

The next year was published a quarto volume, "A Survey of London," on which the reputation of Stow is based. His "Chronicles" are rarely exhumed to be looked at as curiosities of typography, while his description of the city which "BRUTE, lineally descended from the demigod ÆNEAS, the son of VENUS, daughter of JUPITER, about the year of the world 2855, built near unto the river now called Thames, and named it Troynovant or Trenovant," is likely to be familiar to the famous New Zealander before he begins to sketch the ruins of St. Paul's. In it Stow combined research and observation. To gain his evidence he had to give "many a weary mile's travel, many a hard earned penny and pound, and many a cold winter night's study." But he was familiar with London for more than seventy years, and his youthful remembrances continued to be clear and definite. The description of Goodman's Fields, which was once the property of the Poor Clares or Minories, must always charm:—"Near adjoining to this abbey, on the south side thereof, was sometime a farm belonging to the said nunnery; at which farm I myself, in my youth, have fetched many a halfpenny worth of milk, and never had less than three ale pints for a halfpenny in the summer, nor less than one ale quart for a halfpenny in the winter, always hot from the kine as the same was milked and strained." ISAAC WALTON could not produce a more pleasing picture.

He may have lived then in or near Aldgate, for he relates that he witnessed an execution before the door of his house. The criminal said from the ladder, "Good people, I am come hither to die but know not for what offence." A few innocent words spoken to a clergyman

were misinterpreted and in those days life was not valued. Stow is commonly supposed to have cared only for antiquities, but strange accounts could be drawn from his "Survey" about the manner in which the people of London lived in the sixteenth century. They reveal that Merry England was characterised by scenes which were tragic.

Although much has changed, it is surprising how many resemblances exist between the London of to-day and Stow's London. It may seem incredible to find the traffic nuisance in the sixteenth century was as perplexing as it is now. According to Stow, "the number of cars, drays, carts and coaches, more than hath been accustomed, the streets and lanes being straitened, must needs be dangerous, as daily experience proveth." There was a law against "shodde carts" or carts with iron tires unless they were for the service of the prince, but it was disregarded. Coaches were no longer confined to persons of distinction, "for the world runs on wheels, with many whose parents were glad to go on foot."

Old St. Paul's Cathedral was then the principal building in London. In his prosaic manner Stow describes the different parts and gives dimensions, but there is nothing to suggest the effect on spectators. He was a witness to some of the changes in the building. In 1549 the Duke of SOMERSET ordered the chapel founded by GILBERT BECKET, the principal magistrate in the reign of King STEPHEN, and which was re-edified in the reign of HENRY V., to be pulled down and the site converted into a garden for the petty canons. A chapel of the time of HENRY VI. was also demolished to make room for a house. HOLME'S College was suppressed about the same time. In 1561 the great spire was struck by lightning, and "within the space of four hours the same steeple, with all the roofs of the church, were consumed, to the great sorrow and perpetual remembrance of the beholders." Energy was shown in the restoration. The roofs were re-covered by 1566, but the tall spire was not to be renewed. Stow was evidently suspicious about the cause, for he says:—"Concerning the steeple, divers models were devised and made, but little else was done, through whose default God knoweth; it was said that the money appointed for new building of the steeple was collected and brought to the hands of EDMOND GRINDALL, then Bishop of LONDON." In HOLLAR'S engraving of the building as it appeared in 1656 two storeys of the square tower are alone seen.

Stow's poverty is evident from his selling to CAMDEN six volumes of LELAND which he had transcribed for an annuity of 8*l*. Soon afterwards he became destitute. His case was brought before JAMES I., who was supposed to be a scholar, and therefore would admit the claim of a man who had devoted nearly half a century to the history of England. JAMES munificently granted to the "very aged and worthy member of our City of London" letters patent under the great seal authorising him "to collect amongst our loving subjects their voluntary contribution and kinde gratuities." The date of so important a document was March 8, 1604, when Stow had attained the age of seventy-nine. In other words, he obtained a privilege corresponding with the wearers of the blue gown in Scotland, of whom EDIE OCHILTREE was an illustrious representative. BEN JONSON told DRUMMOND that Stow once asked a couple of mendicants how much they required to admit him to their order; by royal warrant he was allowed to ask for food or money without the payment of fees. As he died on April 6, 1605, he was able to follow the profession of mendicancy for only a year. In that time one parish rewarded him with 7*s*. 6*d*. His biographer, STRYPE, wrote:—"Tis strange to me that the City of London, to which he had done such service and honour in writing such an elaborate and accurate survey thereof; nor the wealthy Company of Merchant Taylors, of which he was a worthy and creditable member; nor lastly, the State, in grateful remembrance of his diligent

and faithful pains in composing an excellent history of the Kingdom, neither of them had allotted him some honorary pension during life."

Stow was buried in St. Andrew Undershaft, a late Gothic church, and somehow his widow was enabled to erect a memorial of him in terra-cotta, which still exists, representing him as seated at a table with a pen in one hand and a volume before him. Whether his remains are there is doubtful, for MAITLAND says the corpse was removed in 1732 to make room for another. When living Stow was, according to one of his friends, "tall of stature, leane of body and face, his eyes small and chrystaline, of a pleasant and cheerefull countenance, his sight and memory very good; very sober, mild and courteous to any that required his instructions; and retained the true use of all his senses until the day of his death."

THE ALHAMBRA.

WHEN we find a publicist of the standing of the Marquis DE ALTA-VILLA imploring the Spanish Government to show more energy in restoration of the Alhambra, it may be assumed that serious danger is impending over the Moorish palace. Spaniards have been for generations familiar with anticipations of its fall, and as time runs on they have concluded that by some mysterious means the buildings will hold together. We may therefore believe that if a gentleman of high position takes up the subject it is because he is aware of a change in the conditions, and that ruin is not a remote contingency. Few buildings have had so many enemies, and the wonder is how so much remains after what they have done.

The Alhambra could be included with buildings of a different class as evidence of the remarkable creative power which was manifested in the thirteenth century. Concrete and brick were the principal materials used in the walls, and yet the praises of the different parts which are expressed in the inscriptions are not exaggerated. When one of the gardens is supposed to point to columns which seem to be blocks of pearl, and halls which make the stars grow pale, we must remember that the brick-work was veiled with materials of a more precious kind. Mosaics, tiling, gold and colours were most apparent, and if there was expense it was repaid in beauty.

But from the character of the decoration which was so lavishly introduced there was a temptation to vandalism. The Moors did not enjoy the completed palace for more than two centuries. After the surrender to FERDINAND and ISABELLA an effort was made on a wholesale scale to deprive the Alhambra of whatever was essential to its beauty, but which was supposed to be dangerous to all who looked upon the symbols and ornament. CHARLES V., when his turn came to reside in it, endeavoured to impart a Flemish character to the halls. At a subsequent time the Alhambra was utilised as a hospital and a convict settlement. All the inmates and their hangers-on knew that they could damage the building to any extent which was profitable. Fortunately the Spaniards were afraid of the consequences of possessing Moorish spells in their houses, and curiosity hunters were too cowardly to journey to Granada. There is some satisfaction in remembering that an Irish refugee, RICHARD WALL, in the eighteenth century used his power to prevent further injury.

His preservation was only temporary. The old indifference was soon tolerated. Governor after governor was allowed to do as his whims dictated, and it might be imagined that an official wreaked vengeance on the Alhambra as if it were the cause of his exile in such quarters. Even when the French invaded Spain and the buildings were seized, it was only by chance they were not all blown up when evacuation became a necessity. French writers endeavour to excuse the misdeeds of their countrymen by ascribing them to the fatal necessities of war, but nobody outside France is convinced. According to WASHINGTON IRVING, modern

travellers are indebted to a couple of women who served as caretakers, and were worthy of the title, for the retention of the Moorish characteristics which the Alhambra still presents. After the women's departure the buildings were used to confine galley slaves, and gangs of them were kept at work in loosing the tiles of the walls and throwing them over the battlements. The original wealth of the palace must have been astonishing to allow depredations during so many centuries, and justified the poets who described it by comparing it to some living being of unparalleled beauty. As one of the inscriptions stated:—"Every art has gifted me with its elegance, splendour and perfection. Those who behold me take me for a female. Indeed, when the spectator has attentively examined my beauty, he will find reality to exceed the most extravagant conceptions of his fancy. He will see the full moon beam forth from the rays of my light, and its halo leave me to enter the mansions of the sky."

The visitor who now sees the Alhambra will require to exercise his imagination before he can accept the Moorish poet's words as applicable. Long years of unbridled vandalism have shown their force in all directions. After seven centuries the brickwork where seen is not comparable in colour with that of England which may be a century or two old. Moreover, the Moorish prince, like the majority of Easterns, did not erect a residence which would amaze spectators by its external appearance. Whether small or large, a mansion was intended for the owner's own delight, and he thought only of the embellishment of the interior. That principle has been observed in the Alhambra.

With all its beauty it is remarkable that the Alhambra, or rather the principle which it exemplifies, has never been adopted for English use, although we have acclimatised many styles. When the reproduction of part of it was first opened at Sydenham it received far more admiration than any of the other examples of ancient architecture. OWEN JONES imagined that a style of work which he had so long admired was to come into favour, and his exposition of the principles adopted by the old Moorish artists was so logical, it might be easily concluded there was no style which was equally consistent and better adapted for imitation by rational people. The name was adopted for the building in Leicester Square, but it could not be said that it bore much resemblance to the Moorish palace. On the Continent a few theatres were erected in which the imitation was closer, and they suggested that the style could be used to advantage for that class of building.

Without regarding the Alhambra as a model—for it may as well be admitted that Eastern and Western art are never likely to agree—all who love architecture must desire to see the group of buildings preserved, although they are no longer in their pristine state. That does not necessarily mean that costly new works should be undertaken in the Moorish style. At present it must be allowed there is a good deal of comparatively modern work which is accepted as ancient. The Carcel de la Reyna, or Queen's prison, with its iron grills, at once calls up ancient legends about the punishment of guilty wives, but it is merely a seventeenth-century gallery. The Peinador de la Reyna might be supposed to be a reserved place for devotion, but it also is not of Moorish origin. Similar additions would only increase the anomalies of the place, and may be omitted with advantage. With that exception, the effort which the Marquis DE ALTA-VILLA proposes is deserving of support in all civilised countries. Spain unfortunately is not in a condition to expend large sums on ruins which are more prized by foreigners than by Spaniards. But it is not impossible that a comparatively small sum, if wisely expended, would prevent a collapse. Something should be done, for it must be remembered that the Red Palace alone enables us to realise the refined luxury of Moorish princes, and a style of architecture in which prayers and moral precepts were converted into decoration.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. Edwin T. Hall, vice-president, in the chair.

The decease of George W. Hamilton Gordon, director of public works, Orange River Colony, was announced.

The CHAIRMAN said he had much pleasure in introducing to those who did not know him Mr. Stanley Hamp, who had undertaken to read a paper at the meeting. Mr. Hamp, he said, was the partner of their president, Mr. Colcutt, who had been most anxious to attend, but owing to recent illness their President had gone to Spain to recuperate in health.

Hotel Planning.

Mr. HAMP, in introducing the subject of his paper, showed how development in hotel construction had gone hand in hand with improvements in locomotion, and he put upon the screen illustrations of some interesting old examples of inns which still survive. Reference was made to the inn sign-boards of olden days, to the origin of some of the signs, and to the accommodation and characteristics of the old inns as described in literature of the period. Motorists, the author thinks, will probably bring back to the inns on our rural high roads much of the custom and prestige which they lost through the disappearance of the stage coach. Hotels used in the past for coaching and posting purposes have more than sufficient stall accommodation for present requirements, and it would be a simple matter to adapt it for motor garage.

Discussing modern hotels, which he divided into three classes—viz. residential hotels, commercial hotels, railway hotels—the author said that as regards design the usual tawdry and showy character should be avoided, and the building be designed with a simple architectural treatment. It should be, as far as possible, fireproof, and should have one or more fire-escape staircases arranged with escape exit at each corridor. It should be so planned as to minimise the staff as far as possible. The main entrance should be inviting, the rooms light, but not too large. There should, if possible, be only one entrance and exit for the staff.

The usual accommodation of the modern hotel might be stated to consist of a lounge or winter garden, dining-rooms, restaurant, coffee-room, with services adjoining, reading and writing-room, small drawing-room, smoking and billiard-room with bar attached, ball-room with reception-room attached, office and manager's room, gentlemen's lavatory and cloak-room, ladies' retiring and toilet-rooms. In the basement are situated the kitchen department and offices, the staff dining-rooms, servants' hall.

Often one or two private dining-rooms are required. In the provinces a large hall for public banquets and meetings is necessary, in which case a separate service should be arranged with a separate kitchen. In large hotels a barber's shop is a useful adjunct. The author recommended also for large hotels a bakery and a dairy as well if it can be afforded. The upper floors are usually devoted to bedrooms, bath-rooms, w.c.'s and service-rooms, of which there should be one on each floor fitted with sinks, hot plates, &c., in direct communication with the kitchen, and adjoining which the service lifts to carry coals, &c., should be arranged. Ladies and gentlemen's lavatories should be away from each other, and cut off from the main corridor by a ventilated lobby. The dining-room, especially in large towns, should be provided with an orchestra, and where a ball-room is impossible the dining-room should have a dancing-floor. Some of the rooms on the upper floors should be arranged in suites, with sitting-room, one or more bedrooms, with communicating doors, small hall, from which should lead bath-room and w.c. Communicating doors between rooms should be double, sash windows made reversible so as to be cleaned from the inside, and double windows fixed to windows facing main thoroughfares. Heating coils should be placed in all public rooms, staircases, corridors and landings; and fire-alarms and hydrants provided in all public corridors.

The author summed up as follows the essential features in planning an hotel:—(1) The maximum amount of light and air; (2) a simple and direct plan; (3) a proper distribution of the working and managerial parts of the hotel, and easy and direct service communication to the public and private rooms; (4) centralisation of kitchen and office; (5) perfect sanitation; (6) adequate means of escape in case of fire and panic. The author dealt with these points in some detail, and touched upon such matters as telephone service, "vacuum" cleaning, &c.

On the subject of ventilation, reference was made to the system in use at the Midland Hotel, Manchester. Here, by means of two fans revolving 180 times per minute, 2½ million cubic feet per hour of fresh air, cool in summer and heated in winter, are introduced into the building. The air is filtered through a screen of special material, which has an area of 320 square feet exposed to the air inlet. This screen extracts all the soot and chemicals, clearing the air as it passes through, the largeness of the area of the screen making the resistance to the fans as little as possible. The air extraction and ventilation of the guests' rooms should be absolutely separate from the other portions of the buildings, and special attention should be given to the extraction of air and heat from the kitchens, laundries and such places, especially if they are in the basement.

As regards fire alarms, the author considered the right course was to give the alarm only to the officials and the staff. If a universal alarm be given a serious panic might easily arise, whereas the action of a well-trained staff might avoid a serious outbreak in the event of actual danger. One service-room on each floor should be equipped with an indicator and an alarm bell. On the face of the indicator would be numerous little apertures of about 1 inch square, each aperture representing a corridor on the various floors. Therefore, should a fire break out in the main corridor on the sixth floor and the alarm be given, the bell would ring in the service-room on each floor, and upon every indicator would appear a red disc in the aperture, "Main corridor, floor sixth." Thus the staff on each floor would know exactly in which corridor the fire had broken out.

The internal arrangement of kitchen and offices most concerns an hotel manager, and the architect should, where possible, consult him if he is to obtain satisfactory technical results. The kitchen is the laboratory where the reputation of the hotel is made or marred, and the kitchen staff should be given plenty of light and ventilation; the ranges, grilles, ovens and hot plates should be of the best procurable, and plenty of utensils should be at hand. The walls of kitchen, scullery and larders should be either white tiles or glazed brickwork, and the floors of stone, or "granolithic" or terrazzo. With the application of electrically-driven propelling fans and tubes for the supply of fresh air, and extracting fans fixed at the top of vent tubes and vent shafts, it is now recognised that the most convenient position for the kitchen is in the basement.

The author dealt in detail with the requirements and arrangements of the various sections of the kitchen department, the position of the service-rooms, ice and ice-making department, sculleries, pantries, larders, various stores, cellars, lifts, &c. In conclusion a list was given of the fittings installed at the recently opened University Hotel.

Numerous plans and views of hotels in Great Britain and abroad were exhibited as illustrations.

Mr. JOHN SLATER, in proposing a vote of thanks to Mr. Hamp, said they were very greatly indebted to him for the trouble he had taken over the paper, and for the numerous drawings which accompanied it, and for the lantern slides illustrating matters appertaining to a large hotel. It was almost impossible to follow the paper in many of the details which had been described, because the buildings would require hours of study before one could criticise the arrangements with any advantage. The views of the old inns were extremely interesting, and a new charm was added to them by the narrative which gave the history of the curious distinguishing signs which still survived. The wording of the signs was also interesting since it was often found to be a corruption of the original. Mr. Hamp had said in his paper that there should be only one entrance for the staff. That was a counsel of perfection, but they had the London County Council to consider, and in their regulations as to building there were special provisions dealing with the means of exit. The doors, too, had to be so arranged that they could be opened by a mere push from the outside. Mr. Slater said he happened to be engaged on a hotel and he had pointed out to the County Council that under such requirements it would be almost impossible to manage a hotel satisfactorily. If doors were opened too easily the entrance of undesirable people into the hotel was difficult to control. The County Council were aware of this objection, but they argued that they were more concerned in the safety of people in cases of fire or panic. The Council did not seem to realise that in modern hotel building the material used in construction was fireproof, and that there was little chance of fire breaking out. There was the risk of panic from smoke, and this necessitated separate exits from all floors. In London the

sites for hotels were costly and the provision of separate exits created a very great difficulty in planning. Mr. Hamp had advised the arrangement of the kitchen on the ground-floor. That was also a counsel of perfection, because there were few hotels where the area of the site was sufficient to enable the architect to include the kitchen and service-room on the same floor as the coffee-room and dining-rooms. It was, however, better to put the kitchen in the basement than on the top floor as was done in certain hotels some years ago. The lavatory arrangements always required careful consideration, and Mr. Slater was inclined to the opinion that it was desirable to have the water-closet and bath-room together.

Mr. E. A. GRUNING seconded the vote of thanks. He said he himself had studied hotel work for a long period, and he could recognise the difficulties Mr. Hamp and his well-known partner had overcome in the successful planning of the Savoy Hotel. The architects in hotel work were often hampered by the nature of the site, the nature of the requisitions and the nature of the trade that was carried on. The paper was full of information, but, the speaker added humorously, the cook was the man to be considered, and yet the arrangement of kitchens was not exhaustively treated.

Mr. WM. WOODWARD supported the observations made by the two preceding speakers. He thought they would all agree that the planning of a hotel required as much skill, thought and knowledge as was essential to any building. The enormous amount of detail that went to the making of a successful hotel required both skill and experience in arrangement. He ventured to suggest, after having used the Savoy Hotel, and after staying at the delightful hotel in Algieras, that, in his opinion, there was no firm of architects who knew better how to design and equip a hotel than the partners, Messrs. Colclutt & Hamp. In the paper Mr. Hamp had summed up the requirements of an hotel in one sentence, and the plan which could conform to those requirements would fulfil all that was necessary both for the client and the public. With varied sites to be dealt with it would be difficult to secure a general arrangement, but the speaker thought there was one feature which should be common to hotels—he referred to the necessity for simplicity in plan, more especially with regard to upper floors. Another important point touched upon in the paper was the economy of service. There were one or two hotels in London which it was quite impossible to make financial successes because the arrangements for service had been so badly planned. Ventilating and heating in hotels was a subject which Mr. Woodward considered should be left very properly to an expert who was thoroughly accustomed to that branch of work. The speaker also drew attention to the need for good locks on the doors of bedrooms. He also pointed out the desirability of perfectly sound-proof partitions, double doors between the rooms and double windows.
